Rules and Regulations for the Classification of Ships

July 2015

A guide to the Rules

and published requirements

Rules and Regulations for the Classification of Ships

Introduction

The Rules are published as a complete set; individual Parts are, however, available on request. A comprehensive List of Contents is placed at the beginning of each Part.

Rules updating

The Rules are generally published annually and changed through a system of Notices between releases.

Rules programs

LR has developed a suite of Calculation Software that evaluates Requirements for Ship Rules, Offshore Rules, Special Service Craft Rules and Naval Ship Rules. For details of this software please contact LR.

Direct calculations

The Rules may require direct calculations to be submitted for specific parts of the ship structure or arrangements and these will be assessed in relation to LR's own direct calculation procedures. They may also be required for ships of unusual form, proportion or speed, where intended for the carriage of special cargoes or for special restricted service and as supporting documentation for arrangements or scantlings alternative to those required by the Rules.

July 2015

Lloyd's Register is a trading name of Lloyd's Register Group Limited and its subsidiaries. For further details please see <http://www.lr.org/entities>

Lloyd's Register Group Limited, its subsidiaries and affiliates and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

CLASSIFICATION

PART	1	REGULATIONS
PART	2	RULES FOR THE MANUFACTURE, TESTING AND CERTIFICATION OF MATERIALS
PART	3	SHIP STRUCTURES (GENERAL)
PART	4	SHIP STRUCTURES (SHIP TYPES)
PART	5	MAIN AND AUXILIARY MACHINERY
PART	6	CONTROL, ELECTRICAL, REFRIGERATION AND FIRE
PART	7	OTHER SHIP TYPES AND SYSTEMS
PART	8	RULES FOR ICE AND COLD OPERATIONS

The following explanatory note is offered to assist those concerned in the application of these Rules and Regulations.

Explanatory Note

Ship classification may be regarded as the development and worldwide implementation of published Rules and Regulations which, in conjunction with proper care and conduct on the part of the Owner and operator, will provide for:

- (a) the structural strength of (and where necessary the watertight integrity of) all essential parts of the hull and its appendages;
- (b) the safety and reliability of the propulsion and steering systems; and
- (c) the effectiveness of those other features and auxiliary systems which have been built into the ship in order to establish and maintain basic conditions on board whereby appropriate cargoes and personnel can be safely carried whilst the ship is at sea, at anchor, or moored in harbour.

Lloyd's Register (LR) maintains these provisions by way of the periodical visits by its Surveyors to the ship as defined in the Regulations in order to ascertain that the vessel currently complies with those Rules and Regulations. Should significant defects become apparent or damages be sustained between the relevant visits by the Surveyors, the Owner and operator are required to inform LR without delay. Similarly any modification which would affect Class must receive prior approval by LR.

A ship is said to be in Class when the Rules and Regulations which pertain to it have, in the opinion of LR, been complied with, or when special dispensation from compliance has been granted by LR.

It should be appreciated that, in general, classification Rules and Regulations do not cover such matters as the ship's floatational stability, life-saving appliances, and structural fire protection, detection and extinction arrangements where these are covered by the *International Convention for the Safety of Life at Sea, 1974, its Protocol of 1978*, and the amendments thereto. Nor do they cover pollution prevention arrangements where these are covered by the *International Convention for the Prevention of Pollution from Ships, 1973, its protocol of 1978*, and the amendments thereto. Nor do they protect personnel on board from dangers connected with their own actions or movement around the ship. This is because the handling of these aspects is the prerogative of the National Authority with which the ship is registered. A great many of these authorities, however, delegate such responsibilities to the Classification Societies who then undertake them in accordance with agreed procedures.

■ *Section 1* **Background**

1.1 Lloyd's Register Group Limited is a registered company under English law, with origins dating from 1760. It was established for the purpose of producing a faithful and accurate classification of merchant shipping. It now primarily produces classification Rules.

1.2 Classification services are delivered to clients by a number of other members subsidiaries and affiliates of Lloyd's Register Group Limited, including but not limited to: Lloyd's Register EMEA, Lloyd's Register Asia, Lloyd's Register North America, Inc., and Lloyd's Register Central and South America Limited. Lloyd's Register Group Limited, its subsidiaries and affiliates are hereinafter, individually and collectively, referred to as 'LR'.

■ *Section 2* **Governance**

2.1 Lloyd's Register Group Limited is managed by a Board of Directors (hereinafter referred to as 'the Board').

The Board has:

appointed a Classification Committee and determined its powers and functions and authorised it to delegate certain of its powers to a Classification Executive and Devolved Classification Executives;

appointed Technical Committees and determined their powers, functions and duties.

2.2 LR has established National and Area Committees in the following:

Countries:	Areas:
Australia (via Lloyd's Register Asia)	Benelux (via Lloyd's Register EMEA)
Canada (via Lloyd's Register North America, Inc.)	Central America (via Lloyd's Register Central and South America Ltd)
China (via Lloyd's Register Asia)	Nordic Countries (via Lloyd's Register EMEA)
Egypt (via Lloyd's Register EMEA)	South Asia (via Lloyd's Register Asia)
Federal Republic of Germany (via Lloyd's Register EMEA)	Asian Shipowners (via Lloyd's Register Asia)
France (via Lloyd's Register EMEA)	Greece (via Lloyd's Register EMEA)
Italy (via Lloyd's Register EMEA)	

Japan (via Lloyd's Register Group Limited)

New Zealand (via Lloyd's Register Asia)

Poland (via Lloyd's Register (Polska) Sp zoo)

Spain (via Lloyd's Register EMEA)

United States of America (via Lloyd's Register North America, Inc.)

■ *Section 3* **Technical Committee**

3.1 LR's Technical Committee is at present composed of a maximum of 80 members which includes:

Ex officio members:

- Chairman and Chief Executive Officer of Lloyd's Register Group Limited
- Chairman of the Classification Committee of Lloyd's Register Group Limited

Members Nominated by:

- Technical Committee
- Professional bodies representing technical disciplines relevant to the industry
- National and International trade associations with competence relevant to technical issues related to LR's business

3.2 In addition to the foregoing:

- (a) Each National or Area Committee may appoint a representative to attend meetings of the Technical Committee.
- (b) A maximum of five further representatives from National Administrations may be co-opted to serve on the Technical Committee. Representatives from National Administrations may also be elected as members of the Technical Committee under one of the categories identified in Pt 1, Ch 1, 3 Technical Committee.
- (c) Further persons may be co-opted to serve on the Technical Committee by the Technical Committee.

3.3 All elections are subject to confirmation by the Board.

3.4 The function of the Technical Committee is to consider:

- (a) any technical issues connected with LR's business;
- (b) any proposed alterations in the existing Rules;
- (c) any new Rules for classification;

Where changes to the Rules are necessitated by mandatory implementation of International Conventions and Codes, or Common Rules, Unified Requirements and Interpretations adopted by the International Association of Classification Societies, these may be implemented by LR without consideration by the Technical Committee, although any such changes will be provided to the Technical Committee for information.

Where changes to the Rules are required by LR to enable existing technical requirements within the Rules to be recognised as Class Notations or Descriptive Notes, these may be implemented by LR without consideration by the Technical Committee, although any such changes will be provided to the Technical Committee for information.

3.5 The term of office of the Chairman and of all members of the Technical Committee is five years. Members may be re-elected to serve an additional term of office with the approval of the Board. The term of office of the Chairman may be extended with the approval of the Board.

3.6 In the case of continuous non-attendance of a member, the Technical Committee may withdraw membership.

3.7 Meetings of the Technical Committee are convened as often and at such times and places as is necessary, but there is to be at least one meeting in each year. Urgent matters may be considered by the Technical Committee by correspondence.

3.8 Any proposal involving any alteration in, or addition to, Pt 1, Ch 1 General Regulations of Rules for Classification is subject to approval of the Board. All other proposals for additions to or alterations to the Rules for Classification other than Pt 1,

Ch 1 General Regulations, will following consideration and approval by the Technical Committee either at a meeting of the Technical Committee or by correspondence, be recommended to the Board for adoption.

3.9 The Technical Committee is empowered to:

- (a) appoint sub-Committees or panels; and
- (b) co-opt to the Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem.

■ *Section 4* **Naval Ship Technical Committee**

4.1 LR's Naval Ship Technical Committee is at present composed of a maximum of 50 members and includes:

Ex officio members:

- Chairman and Chief Executive Officer of Lloyd's Register Group Limited

Member nominated by:

- Naval Ship Technical Committee;
- The Royal Navy and the UK Ministry of Defence;
- UK Shipbuilders, Ship Repairers and Defence Industry;
- Overseas Navies, Governments and Governmental Agencies;
- Overseas Shipbuilders, Ship Repairers and Defence Industries;

4.2 All elections are subject to confirmation by the Board.

4.3 All members of the Naval Ship Technical Committee are to hold security clearance from their National Authority for the equivalent of NATO CONFIDENTIAL. All material is to be handled in accordance with NATO Regulations or, for non-NATO countries, an approved equivalent. No classified material shall be disclosed to any third party without the consent of the originator.

4.4 The term of office of the Naval Ship Technical Committee Chairman and of all members of the Naval Ship Technical Committee is five years. Members may be re-elected to serve an additional term of office with the approval of the Board. The term of the Chairman may be extended with the approval of the Board.

4.5 In the case of continuous non-attendance of a member, the Naval Ship Technical Committee may withdraw membership.

4.6 The function of the Naval Ship Technical Committee is to consider technical issues connected with Naval Ship matters and to approve proposals for new Naval Ship Rules, or amendments to existing Naval Ship Rules.

4.7 Meetings of the Naval Ship Technical Committee are convened as necessary but there will be at least one meeting per year. Urgent matters may be considered by the Naval Ship Technical Committee by correspondence.

4.8 Any proposal involving any alteration in, or addition to, Pt 1, Ch 1 General Regulations of Rules for Classification of Naval Ships is subject to approval of the Board. All other proposals for additions to or alterations to the Rules for Classification of Naval Ships, other than Pt 1, Ch 1 General Regulations, will following consideration and approval by the Naval Ship Technical Committee, either at a meeting of the Naval Ship Technical Committee or by correspondence, be recommended to the Board for adoption.

4.9 The Naval Ship Technical Committee is empowered to:

- (a) appoint sub-Committees or panels; and
- (b) co-opt to the Naval Ship Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem.

■ *Section 5***Applicability of Classification Rules and Disclosure of Information**

5.1 LR has the power to adopt, and publish as deemed necessary, Rules relating to classification and has (in relation thereto) provided the following:

- (a) Except in the case of a special directive by the Board, no new Regulation or alteration to any existing Regulation relating to classification or to class notations is to be applied to existing ships.
- (b) Except in the case of a special directive by the Board, or where changes necessitated by mandatory implementation of International Conventions, Codes or Unified Requirements adopted by the International Association of Classification Societies are concerned, no new Rule or alteration in any existing Rule is to be applied compulsorily after the date on which the contract between the ship builder and shipowner for construction of the ship has been signed, nor within six months of its adoption. The date of 'contract for construction' of a ship is the date on which the contract to build the ship is signed between the prospective shipowner and the ship builder. This date and the construction number (i.e. hull numbers) of all the vessels included in the contract are to be declared by the party applying for the assignment of class to a newbuilding. The date of 'contract for construction' of a series of sister ships, including specified optional ships for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective shipowner and the ship builder. In this section a 'series of sister ships' is a series of ships built to the same approved plans for classification purposes, under a single contract for construction. The optional ships will be considered part of the same series of sister ships if the option is exercised not later than 1 year after the contract to build the series was signed. If a contract for construction is later amended to include additional ships or additional options, the date of 'contract for construction' for such ships is the date on which the amendment to the contract is signed between the prospective shipowner and the ship builder. The amendment to the contract is to be considered as a 'new contract'. If a contract for construction is amended to change the ship type, the date of 'contract for construction' of this modified vessel, or vessels, is the date on which the revised contract or new contract is signed between the Owner, or Owners, and the shipbuilder. Where it is desired to use existing approved ship or machinery plans for a new contract, written application is to be made to LR. Sister ships may have minor design alterations provided that such alterations do not affect matters related to classification, or if the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective owner and the ship builder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to LR for approval.
- (c) All reports of survey are to be made by surveyors authorised by members of the LR Group to survey and report (hereinafter referred to as 'the Surveyors') according to the form prescribed, and submitted for the consideration of the Classification Committee.
- (d) Information contained in the reports of classification and statutory surveys will be made available to the relevant owner, National Administration, Port State Administration, P&I Club, hull underwriter and, if authorised in writing by that owner, to any other person or organisation.
- (e) Notwithstanding the general duty of confidentiality owed by LR to its client in accordance with the LR Rules, LR clients hereby accept that, LR will participate in the IACS Early Warning System which requires each IACS member to provide its fellow IACS members and Associates with relevant technical information on serious hull structural and engineering systems failures, as defined in the IACS Early Warning System (but not including any drawings relating to the ship which may be the specific property of another party), to enable such useful information to be shared and utilised to facilitate the proper working of the IACS Early Warning System. LR will provide its client with written details of such information upon sending the same to IACS Members and Associates.
- (f) Information relating to the status of classification and statutory surveys and suspensions/withdrawals of class together with any associated conditions of class will be made available as required by applicable legislation or court order.
- (g) A Classification Executive consisting of senior members of LR's Classification Department staff shall carry out whatever duties that may be within the function of the Classification Committee that the Classification Committee assigns to it.

■ *Section 6* **Ethics**

6.1 No LR Group employee is permitted under any circumstances, to accept, directly or indirectly, from any person, firm or company, with whom the work of the employee brings the employee into contact, any present, bonus, entertainment or honorarium of any sort whatsoever which is of more than nominal value or which might be construed to exceed customary courtesy extended in accordance with accepted ethical business standards.

■ *Section 7* **Non-Payment of Fees**

7.1 LR has the power to withhold or, if already granted, to suspend or withdraw any ship from class (or to withhold any certificate or report in any other case), in the event of non-payment of any fee to any member of the LR Group.

■ *Section 8* **Limits of Liability**

8.1 When providing services LR does not assess compliance with any standard other than the applicable LR Rules, international conventions and other standards agreed in writing.

8.2 In providing services, information or advice, LR does not warrant the accuracy of any information or advice supplied. Except as set out herein, LR will not be liable for any loss, damage or expense sustained by any person and caused by any act, omission, error, negligence or strict liability of LR or caused by any inaccuracy in any information or advice given in any way by or on behalf of LR even if held to amount to a breach of warranty. Nevertheless, if the Client uses LR services or relies on any information or advice given by or on behalf of LR and as a result suffers loss, damage or expense that is proved to have been caused by any negligent act, omission or error of LR or any negligent inaccuracy in information or advice given by or on behalf of LR then LR will pay compensation to the client for its proved loss up to but not exceeding the amount of the fee (if any) charged for that particular service, information or advice.

8.3 LR will print on all certificates and reports the following notice: Lloyd's Register Group Limited, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

8.4 Except in the circumstances of section 8.2 above, LR will not be liable for any loss of profit, loss of contract, loss of use or any indirect or consequential loss, damage or expense sustained by any person caused by any act, omission or error or caused by any inaccuracy in any information or advice given in any way by or on behalf of LR even if held to amount to a breach of warranty.

8.5 Any dispute about LR services is subject to the exclusive jurisdiction of the English courts and will be governed by English law.

Section

- 1 **Conditions for classification**
- 2 **Character of classification and class notations**
- 3 **Surveys - General**
- 4 **IACS and EMSA Audits and Assessments**
- 5 **Type Approval/Type Testing/Quality Control System**
- 6 **Classification of machinery with [⌘] LMC or MCH notation**

■ *Section 1* **Conditions for classification**

1.1 General

1.1.1 Ships referred to in this Chapter are defined in Pt 3 Ship Structures (General), Pt 4 Ship Structures (Ship Types) and Pt 7 Other Ship Types and Systems of these Rules. Machinery referred to in this Chapter is defined in Pt 5 Main and Auxiliary Machinery and Pt 6 Control, Electrical, Refrigeration and Fire of these Rules. Systems referred to in this Chapter are defined in Pt 7 Other Ship Types and Systems of these Rules. Materials are referred to in the *Rules for the Manufacture and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.1.2 Ships built in accordance with Lloyd's Register Group Limited's Rules and Regulations, or in accordance with requirements equivalent thereto, will be assigned a class in the *Register Book* and will continue to be classed as long as they are found, upon examination at the prescribed surveys, to be maintained in accordance with the requirements of the Rules. Classification will be conditional upon compliance with LR's requirements for both hull and machinery and with the Certification Requirements of 1.1.

1.1.3 The Classification Committee, in addition to requiring compliance with LR's Rules, may require to be satisfied that ships are suitable for the geographical or other limits or conditions of the service contemplated.

1.1.4 Loading conditions and any other preparations required to permit a ship with a class notation specifying some service limitation to undertake a sea-going voyage, either from port of building to service area or from one service area to another, are to be in accordance with arrangements agreed by LR prior to the voyage.

1.1.5 Any damage, defect, breakdown, grounding, serious deficiency, detention or, arrest or refusal of access, which could invalidate the conditions for which a class has been assigned, is to be reported to LR without delay.

1.1.6 The Rules are framed on the understanding that ships will be properly loaded and handled. They do not, unless stated or implied in the class notation, provide for special distributions or concentrations of loading. The Classification Committee may require additional strengthening to be fitted in any ship which, in their opinion, would otherwise be subjected to severe stresses due to particular features in the design, or where it is desired to make provision for exceptional loaded or ballast conditions. In such cases, particulars are to be submitted for consideration.

1.1.7 When longitudinal strength calculations have been required, loading guidance information is supplied to the Master by means of a Loading Manual and in addition, when required, by means of a loading instrument.

1.1.8 The Rules are framed on the understanding that ships will not be operated in environmental conditions more severe than those agreed for the design basis and approval, without the prior agreement of LR.

1.1.9 For ships, the arrangements and equipment of which are required to comply with the requirements of the:

- Load Lines Convention;
- *International Convention for the Safety of Life at Sea, 1974* and its Protocol of 1978;
- *International Convention for the Prevention of Pollution from Ships, 1973*, as modified by the Protocol of 1978 relating thereto;
- *International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk* (IBC Code);

- *International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (IGC Code);*

and applicable Amendments thereto, the Classification Committee requires the applicable Convention Certificates to be issued by a National Administration, or by LR, or by an IACS Member when so authorised. Safety Management Certificates in accordance with the provisions of the *International Safety Management Code (ISM Code)* may be issued by an organisation complying with IMO Resolution A.739(18) and authorised by the National Authority with which the ship is registered. Cargo Ship Radio Certificates may be issued by an organisation authorised by the National Administration with which the ship is registered. In the case of dual-classed ships, Convention Certificates may be issued by the other Society with which the ship is classed provided this is recognised in a formal Dual Class Agreement with LR and provided the other Society is also authorised by the National Administration. In the event of a National Administration withdrawing any ship's Convention Certificate (referred to in this section) then the Classification Committee may suspend the ship's class. If a ship is removed from the National Administration's Registry for the non-compliance with the Conventions or Classification Requirements referred to herein then the Classification Committee will suspend the ship's class. In the event of ISM Code certification being withdrawn from a ship or Operator then the Classification Committee will suspend the ship's class.

1.1.10 Where an onboard computer system having longitudinal strength computation capability, which is required by the Rules, is provided on a new ship, or newly installed on an existing ship, then the system is to be certified in respect of longitudinal strength in accordance with LR's document entitled *Approval of Longitudinal Strength and Stability Calculation Programs*, see also Pt 3, Ch 4, 8 Loading guidance information

1.1.11 Where an onboard computer system having stability computation capability is provided on a new ship, then the system is to be certified in respect of stability aspects in accordance with LR's document entitled, *Approval of Longitudinal Strength and Stability Calculation Programs*. When provided, an onboard computer system having stability computation capability is to carry out the calculations and checks necessary to assess compliance with all the stability requirements applicable to the ship on which it is installed.

1.1.12 Where a ship has been detained by Port State Control the Owner is to advise LR immediately in order to arrange the attendance of a Surveyor.

1.2 Advisory services

1.2.1 The Rules do not cover certain technical characteristics, such as stability, trim, hull vibration, etc., but advice may be given on such matters without any assumption of responsibility for such advice.

■ *Section 2*

Character of classification and class notations

2.1 Definitions

Note For the purpose of class notations, the definitions given in Pt 1, Ch 2, 2.1 Definitions to Pt 1, Ch 2, 2.1 Definitions will apply.

2.1.2 **Clear water.** Water having sufficient depth to permit the normal development of wind generated waves.

2.1.3 **Fetch.** The extent of clear water across which a wind has blown before reaching the ship.

2.1.4 **Sheltered water.** Water where the fetch is six nautical miles or less.

2.1.5 **Reasonable weather.** Wind strengths of force six or less in the Beaufort scale, associated with sea states sufficiently moderate to ensure that green water is taken on board the ship's deck at infrequent intervals only or not at all.

2.1.6 **Type notation.** A notation indicating that the ship has been arranged and constructed in compliance with particular Rules intended to apply to that type of ship. Type notations that may be assigned are listed in Table 2.2.1 Type notations.

Classification Regulations

Part 1, Chapter 2

Section 2

Table 2.2.1: Type notations

Dry cargo	Tanker	Passenger
Anchor handler	Chemical tanker	Passenger ferry
AHTS (Anchor Handler Tug Ship)	Double hull oil tanker	Passenger/vehicle ferry
Barge	Liquefied gas carrier	Passenger ship
Bulk carrier	Liquefied gas tanker	Passenger yacht
Container ship	Oil barge	Roll on-Roll off passenger ship
Diving support ship	Oil or bulk carrier	Sailing passenger ship
Dredger	Oil recovery ship	
Escort tug	Oil tanker	
Fire fighting	Ore or oil carrier

Split hopper barge		
Split hopper dredger		
Trawler		
Tug		
Vehicle carrier		

Classification Regulations

Part 1, Chapter 2

Section 2

2.1.7 **Cargo notation.** A notation indicating that the ship has been designed, modified or arranged to carry one or more particular cargoes, e.g. sulphuric acid. Ships with one or more particular cargo notations are not thereby prevented from carrying other cargoes for which they are suitable.

2.1.8 **Special duties notation.** A notation indicating that the ship has been designed, modified or arranged for special duties other than those implied by the type and cargo notations, e.g. research. Ships with special duties notations are not thereby prevented from performing any other duties for which they may be suitable.

2.1.9 **ShipRight notation.** Where one or more of LR's ShipRight notation procedures have been satisfactorily applied, then a notation showing the associated characters of the procedure(s) within brackets will, at the Owner's request, be entered in column 4 of the *Register Book*, preceded by the word **ShipRight**, see Pt 1, Ch 2, 2.3 Class notations (hull). Other ShipRight procedures that have been satisfactorily applied will similarly be shown as descriptive notes and will appear in column 6 of the *Register Book*, see Pt 1, Ch 2, 2.8 Descriptive notes.

2.1.10 **Special features notation.** A notation indicating that the ship incorporates special features which significantly affect the design, see Table 2.2.2 Special features notations.

Table 2.2.2: Special features notations

Special features notation	Description	See also
BC	Assigned to bulk carriers of length 150 m or above	Pt 4, Ch 7, 1.4 Class notation for CSR bulk carriers
Bottom Strengthened for (Operating Aground) (Loading and Unloading Aground)	Assigned where the bottom structure has been additionally strengthened for loading and unloading aground	Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground and Pt 4, Ch 12, 1.3 Class notations
BLS	Bow Loading System. Assigned to tankers equipped with bow loading arrangements to facilitate the transfer of cargo oil from offshore loading terminals	Pt 7, Ch 6, 1.2 Class notations
BoxMax	Where a container ship has an approved onboard container lashing program which is installed and maintained in accordance with the requirements of the Rules, the special features notation BoxMax may be assigned on application from Owners. In conjunction with the notation BoxMax , the following supplementary characters may be assigned and are to be shown consecutively in brackets; V may be assigned where, in addition to the requirements for BoxMax , the onboard lashing program is capable of performing calculations specific to defined sea areas, and the weather-dependent factors for these areas have been supplied by LR; W may be assigned where, in addition to the requirements for BoxMax(V) , the onboard lashing program is capable of performing calculations specific to defined sea areas and seasons, and the weather-dependent factors for these areas and seasons have been supplied by LR	Pt 3, Ch 4 Longitudinal Strength and Pt 3, Ch 14 Cargo Securing Arrangements
Cargo Loading on (Tank Top/ Tween/ Deck (s) Plating/ Hatch cover(s)) limited to tonnes/m²	Assigned where cargo loading on tank tops, decks and/or hatch covers are limited to a specified maximum value which is less than the normal Rule loading	—
Carriage of Oils with a F.P. not exceeding 60°C	Assigned to non-oil tankers where the ship is suitably constructed and arranged for the carriage of oils with a flash point not exceeding 60°C (closed cup test)	Pt 4, Ch 9 Double Hull Oil Tankers Pt 4, Ch 10 Single Hull Oil Tankers

Classification Regulations

Part 1, Chapter 2

Section 2

Carriage of Oils with a F.P. exceeding 60°C	Assigned where only the carriage of oils having a flash point exceeding 60°C (closed cup test) is contemplated	Pt 4, Ch 9, 1.1 General
(Specified Cargo(es)) only	Assigned where arrangements have been approved for the carriage of a specific product(s)	Pt 4, Ch 9, 1.1 General
CC	Assigned where structures are fitted with an approved corrosion control system	Pt 1, Ch 3 Periodical Survey Regulations
CCSA	Certified Container Securing Arrangements. Assigned where freight container securing arrangements are fitted, and the design and construction of the system is in accordance with LR Rules and loose fittings are supplied	Pt 3, Ch 14 Cargo Securing Arrangements
CG	Cargo Gear. Assigned where cargo gear is included in class at the Owner's request	Pt 3, Ch 9, 6 Lifting appliances and support arrangements
CL	Cargo Lift(s). Assigned where cargo lift(s) are included in class at the Owner's request	Pt 3, Ch 9, 6 Lifting appliances and support arrangements
CR	Cargo Ramp(s). Assigned where cargo ramp(s) are included in class at the Owner's request	Pt 3, Ch 9, 6 Lifting appliances and support arrangements
CRC –/– –kW –%/– %	<p>Carriage of refrigerated containers. The CRC notation may be applied to any ship which has the ability to carry refrigerated containers operating at their design condition with a 24-hour average external ambient air temperature of 35°C</p> <p>The following descriptive notations may be appended, giving details of electrical power and type of cargo:</p> <p>–/– No. of hold-stowed refrigerated containers/No. of deck-stowed refrigerated containers e.g. 230/140</p> <p>–kW Power generating capacity dedicated to supplying the container plug-in points, e.g. 2,800 kW</p> <p>–%/–% Stowage ratio of deep frozen and chilled cargoes, e.g. 60%/40%</p>	Pt 7, Ch 10, 1.1 General
Container Cargoes in (((all) Hold (No(s)))) (and on Upper Deck)((and on (all) Hatch Cover(s) (No(s))...)	Assigned where general cargo ships carry container cargoes.	Pt 3, Ch 4 Longitudinal Strength
Deck No(s) ... Strengthened for Carriage of Roll on-Roll off Cargoes	Assigned where it is proposed either to stow wheeled vehicles on the deck or to use wheeled vehicles for cargo handling and the deck and supporting structure has been specially considered	Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles
DSPM4	Dual Single Point Mooring. Assigned to a ship provided with a dual mooring line arrangement at a single-point mooring	Pt 3, Ch 13, 8 Windlass design and testing
ECL(1, 2, 3)	Assigned to vessels where work spaces, movement about the ship, fall protection and working arrangements on deck have been specially considered for performing container securing, inspection and other related tasks	Provisional Rules and Regulations for Ergonomic Container Lashing

Classification Regulations

Part 1, Chapter 2

Section 2

ELD	Assigned when ergonomic lighting design has been applied	Pt 6, Ch 2, 23 Ergonomic Lighting Design – ELD optional notation and Pt 16, Ch 2, 22 Ergonomic Lighting Design – ELD optional notation
Fire-Fighting Ship 1, 2, 3 (with water spray)	Designed where fire protection and fire-fighting equipment is provided. Type 1, 2 or 3 signifies the capacity of the fire-fighting equipment. The total discharge capacity of the monitors in m ³ /h is shown in brackets. 'With water spray' signifies that a ship is provided with a water spray system which will provide an effective cooling spray of water	Pt 7, Ch 3 Fire-fighting Ships
Hatch Covers omitted in Hold (No(s)) ...	Assigned where the omission of hatch covers have been specially considered based upon the model tests or alternative means to determine the quantity of water likely to ingress the cargo holds and the means by which it is effectively and safely discharged	Pt 4, Ch 8, 11.4 Omission of hatch covers
Heavy Deck Loads	Assigned where decks are strengthened for loading in excess of Rule basic minimum, e.g. 'Upper deck aft of Fr. 50 strengthened for load of 10 tonnes/m ² '	Pt 3, Ch 6 Aft End Structure
Helideck	Assigned where a designated helicopter landing platform or other deck area with fire-fighting appliances and other equipment necessary for the safe operation of helicopters are provided.	Pt 3, Ch 9, 5 Helicopter landing areas
Occasional Helicopter Landing Area	Assigned where an area on a ship designated for occasional or emergency landing of helicopters is provided.	Pt 3, Ch 9, 5 Helicopter landing areas
Hold (No(s)) ... may be empty at draughts not (less than) (exceeding) ...m	Assigned where particular loading arrangements have been specially considered	Pt 4, Ch 7 Bulk Carriers
Ice Class	Assigned where a ship is strengthened to navigate in specific ice conditions. Supplementary Ice Class notations are given in Table 2.2.3 Notations for ice and cold operations	Pt 8, Ch 1 Application and Pt 8, Ch 2 Ice Operations - Ice Class
Icebreaker	Assigned designed for icebreaking duties	Pt 8, Ch 1 Application and Pt 8, Ch 2 Ice Operations - Ice Class
LA	Mandatory Lifting Appliance(s). Assigned where the lifting appliance is considered to be an essential feature, e.g. cranes on crane barges, lifting arrangements for diving on diving support ships, and is mandatory	Pt 3, Ch 9, 6 Lifting appliances and support arrangements
LFPL	Low Flashpoint liquids. Assigned to offshore supply ships intended for the carriage of liquids with flashpoint below 60°C (closed cup test) in bulk	Pt 4, Ch 4 Offshore Support Vessels
For Liquefaction and Storage of (Methane, etc.) in Independent Gas Tanks (Type B, etc.), Maximum Vapour Pressure () bar, Minimum Temperature Minus () °C	Assigned where ships of Category 1B or 2 which have process plants installed solely for the purposes of the physical liquefaction of impure feedstock gases at low temperature and the storage of the purified liquefied gases (where the chemical treatment of the impurities is an incidental process)	Pt 7, Ch 2, 2.2 Additional notations
Marpol 20.1.3	Assigned to double hull oil tankers not meeting the Rule minimum double side width requirements but which comply with MARPOL Annex 1, Regulation 20.1.3	Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers

Classification Regulations

Part 1, Chapter 2

Section 2

Marpol 21.1.2	Assigned to double hull oil tankers of less than 5000 tonnes deadweight which have a complete double hull in accordance with MARPOL Annex I, Regulation 21.1.2	Pt 4, Ch 9, 1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers
Movable Decks	Assigned where all movable decks comply with LR requirements. Movable decks other than those specifically indicated in LR Rule requirements are not a classification item	Pt 3, Ch 9, 4 Movable decks
Oil Recovery	Assigned when a ship is equipped for oil recovery operations	Pt 7, Ch 5, 2 Oil recovery
Petrol in Hold (No(s))...	Assigned to ships that can carry motor vehicles with fuel in their tanks for self-propulsion, in specified locations. It does not apply to ships that are designed primarily for the carriage of motor vehicles Specific requirements will be advised upon request	—
PL	Passenger Lift(s). Assigned where the passenger lift(s) are included in class at the Owner's request	Pt 3, Ch 9, 6 Lifting appliances and support arrangements
PM (T1) [or (T2) or (T3)]	For ships fitted with a positional mooring system (PM). The supplementary notation (T1) [or (T2) or (T3)] may be applied if the system is thruster-assisted. The encircled numeral defines the thruster allowance	Pt 7, Ch 8, 1.2 Classification notations
PMC (T1) [or (T2) or (T3)]	For ships fitted with a positional mooring system for mooring in close proximity to other ships or installations (PMC). The supplementary notation (T1) [or (T2) or (T3)] may be applied if the system is thruster-assisted. The encircled numeral defines the thruster allowance	Pt 7, Ch 8, 1.2 Classification notations
RD	Relative Density. Assigned where a ship has tanks appraised for a maximum permissible relative density greater than 1,025	Pt 4, Ch 1 General Cargo Ships Pt 4, Ch 4 Offshore Support Vessels
Self-Discharging (Unloading)	Assigned where a ship fitted with self-unloading equipment whose structural aspect has been specially approved	Pt 4, Ch 12, 1 General
SLS	Stern Loading System. Assigned to tankers equipped with stern loading arrangements to facilitate the transfer of cargo oil from offshore loading terminals	Pt 7, Ch 6, 1 General
Specialised for the Carriage of ...	Assigned to a vessel which has been designed for the carriage of specified cargo other than that applied by the type notation	Pt 4, Ch 4, 1 General
SPM4	Single Point Mooring. Assigned to a ship provided with a single mooring line arrangement at a single point mooring	Pt 3, Ch 13, 8 Windlass design and testing
Strengthened for Heavy Cargoes ((any) Hold (No(s)) may be empty)	Assigned to a bulk carrier of less than 150 m in length or a ship designed for the carriage of heavy cargoes. If only certain holds are strengthened for heavy cargoes, they will be specified	Pt 4, Ch 1 General Cargo Ships and Pt 4, Ch 7, 1 General
HNLS	Hazardous and noxious liquids system. Assigned to ships complying with the requirements for the transport and handling of limited amounts of hazardous and noxious liquid substances in bulk	Pt 4, Ch 4, 8.1 General
Hold No(s) ... Strengthened for Regular Discharge by Heavy Grabs	Assigned to bulk carriers where cargoes are regularly discharged by heavy grabs and the thickness of the plating of the hold inner bottom, hopper and transverse bulkhead bottom stool is increased	Pt 3, Ch 9,7
Submersible to a depth of ...m below Upper Deck in Harbour only	Assigned to a ship that is designed so that it can be submersed to a specified depth in harbour only	—

Classification Regulations

Part 1, Chapter 2

Section 2

Timber Deck Cargoes	Assigned where a cargo of timber is carried on an uncovered part of the freeboard or superstructure deck (does not include wood pulp or similar cargo) and the requirements of the 1966 Load Line Convention concerning timber deck cargoes or other National Regulations are complied with	Pt 3, Ch 9, 2 Timber deck cargoes
TLS	Submerged Turret Loading System. Assigned to tankers equipped with submerged turret loading systems to facilitate the transfer of cargo oil from offshore loading to terminals	Pt 7, Ch 6, 1 General
Winterisation	Assigned to a ship that is intended to navigate in cold climates and may be exposed to low temperatures that may cause equipment to freeze due to ice accretion from atmospheric icing or sea spray or due to freezing of liquid within a system. Protection measures are provided and operational procedures are specified to ensure that equipment is suitably protected to enable operation in low temperatures. Supplementary Winterisation notations are given in Table 2.2.3 Notations for ice and cold operations	Pt 8, Ch 1 Application and Pt 8, Ch 2 Ice Operations - Ice Class
WDL(+)	Weather Deck Load. Assigned where the weather deck load scantlings have been approved for a loading greater than a design head of 3,5 m	Pt 4, Ch 1 General Cargo Ships and Pt 4, Ch 4 Offshore Support Vessels

Table 2.2.3: Notations for ice and cold operations

Notation	Description	Conditions	Application	See also
Ice Class 1E	For offshore supply vessels	Light and very light ice conditions	Hull, Machinery	Pt 8, Ch 2, 4 Hull requirements for light ice conditions – Ice Classes 1D and 1E and Pt 8, Ch 2, 5 Machinery requirements for light ice conditions – Ice Classes 1D and 1E
Ice Class 1D	Hull strengthening in forward region only			
Ice Class 1C FS	Finnish Swedish Ice Class Rules	Ice Class 1C; ships with such structure, engine output and other properties that they are capable of navigating in light ice conditions, with the assistance of icebreakers when necessary;	Hull, Machinery	Pt 8, Ch 2, 6 Hull requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS, 1C FS and 1D and Pt 8, Ch 2, 7 Machinery requirements for first-year ice conditions – Ice Classes 1AS FS, 1A FS, 1B FS and 1C FS
Ice Class 1B FS		Ice Class 1B; ships with such structure, engine output and other properties that they are capable of navigating in moderate ice conditions, with the assistance of icebreakers when necessary		
Ice Class 1A FS		Ice Class 1A; ships with such structure, engine output and other properties that they are capable of navigating in difficult ice conditions, with the assistance of icebreakers when necessary		
Ice Class 1AS FS		Ice Class 1A Super; ships with such structure, engine output and other properties that they are normally capable of navigating in difficult ice conditions without the assistance of icebreakers		

Classification Regulations

Part 1, Chapter 2

Section 2

Ice Class 1C FS(+)	Finnish Swedish Ice Class Rules with enhanced engine power for icebreaking capability	Ice Class 1C; ships with such structure, engine output and other properties that they are capable of navigating in light ice conditions, with the assistance of icebreakers when necessary	Hull, Machinery	Pt 8, Ch 2, 8 Hull requirements for first-year ice conditions – Ice classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+) and Pt 8, Ch 2, 9 Machinery requirements for first-year ice conditions - Ice classes 1AS FS(+), 1A FS(+), 1B FS(+) and 1C FS(+)
Ice Class 1B FS(+)		Ice Class 1B; ships with such structure, engine output and other properties that they are capable of navigating in moderate ice conditions, with the assistance of icebreakers when necessary		
Ice Class 1A FS(+)		Ice Class 1A; ships with such structure, engine output and other properties that they are capable of navigating in difficult ice conditions, with the assistance of icebreakers when necessary		
Ice Class 1AS FS(+)		Ice Class 1A Super; ships with such structure, engine output and other properties that they are normally capable of navigating in difficult ice conditions without the assistance of icebreakers		
Ice Class PC7	IACS Polar Ship Rules	Summer/autumn operation in thin first-year ice which may include old ice inclusions	Hull, Machinery	Pt 8, Ch 2, 10 Hull strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6, PC7 and Icebreaker and Pt 8, Ch 2, 11 Machinery strengthening requirements for navigation in multi-year ice conditions – Ice Classes PC1, PC2, PC3, PC4, PC5, PC6 and PC7
Ice Class PC6		Summer/autumn operation in medium first-year ice which may include old ice inclusions		
Ice Class PC5		Year-round operation in medium first-year ice which may include old ice inclusions		
Ice Class PC4		Year-round operation in thick first-year ice which may include old ice inclusions		
Ice Class PC3		Year-round operation in second-year ice which may include multi-year ice inclusions		
Ice Class PC2		Year-round operation in moderate multi-year ice conditions		
Ice Class PC1		Year-round operation in all Polar waters		

Classification Regulations

Part 1, Chapter 2

Section 2

Winterisation H(†)	Hull construction materials	Low temperature operations	Hull, materials	Ch 1, 2 Materials for hull construction at low temperatures – Winterisation H of the <i>Provisional Rules for the Winterisation of Ships</i>
Winterisation C(†)	Short duration			
Winterisation B(†)	Seasonal duration		Equipment and systems	Ch 1, 3 Materials for equipment and components at low temperatures – Winterisation M of the <i>Provisional Rules for the Winterisation of Ships</i>
Winterisation A(†)	Prolonged duration			

2.1.11 **Service restriction notation.** A notation indicating that a ship has been classed on the understanding that it will be operated only in suitable areas or conditions which have been agreed by the Classification Committee, e.g. protected waters service.

2.1.12 **Linked** means connected, while in operation, to an attendant ship (which may be on shore, submerged or afloat) by a restraining line, suspension cable or umbilical cord.

2.1.13 **Laid-up notation.** A ship not under repair or not actively employed may be assigned the laid-up notation in order to maintain the ship in class subject to agreement by the Classification Committee. A general examination of the hull and machinery is to be carried out in lieu of the Annual Survey. An Underwater Examination (UWE) is to be carried out in lieu of the Special Survey. See Pt 1, Ch 3, 1.1 Frequency of surveys, Pt 1, Ch 3, 2.1 General, Pt 1, Ch 3, 5.1 General and Pt 1, Ch 3, 11.1 Annual, Intermediate and Docking Surveys.

2.2 Character symbols

2.2.1 All ships, when classed, will be assigned one or more character symbols as applicable. For the majority of ships, the character assigned will be **100A1**, **✱ 100A1** or **✱ 100A1**.

2.2.2 A full list of character symbols for which ships may be eligible is as follows:

- ✱ = This distinguishing mark will be assigned, at the time of classing, to new ships constructed under LR's Special Survey in compliance with the Rules, and to the satisfaction of the Classification Committee.
- ✱ = This distinguishing mark, will be assigned to ships built under supervision of another IACS member society and later assigned class with LR. For such ships the class notations will be reviewed separately and equivalent notations will be assigned.

100 = This character figure will be assigned to all ships considered suitable for sea-going service.

A = This character letter will be assigned to all ships which have been built or accepted into class in accordance with LR's Rules and Regulations, and which are maintained in good and efficient condition.

1 = This character figure will be assigned to:

- = (a) Ships having on board, in good and efficient condition, anchoring and/or mooring equipment in accordance with the Rules.
- = (b) Ships classed for a special service, having on board, in good and efficient condition, anchoring and/or mooring equipment approved by the Classification Committee as suitable and sufficient for the particular service.

N = This character letter will be assigned to ships on which the Classification Committee has agreed that anchoring and mooring equipment need not be fitted in view of their particular service.

T = This character letter will be assigned to ships which are intended to perform their primary designed service function only while they are anchored, moored, towed or linked, and which have, in good and efficient condition, adequately attached anchoring, mooring, towing or linking equipment which has been approved by the Classification Committee as suitable and sufficient for the intended service.

2.2.3 For classification purposes, the character figure **1**, or either of the character letters **N** or **T**, is to be assigned.

2.2.4 In cases where the anchoring and/or mooring equipment is found to be seriously deficient in quality or quantity, the class of the ship will be liable to be withheld.

2.3 Class notations (hull)

2.3.1 When considered necessary by the Classification Committee, or when requested by an Owner and agreed by the Classification Committee, a class notation will be appended to the character of classification assigned to the ship. This class notation will consist of one of, or a combination of: a type notation, a cargo notation, a special duties notation, a special features notation and/or a service restriction notation, e.g. `✱ **100A1** Oil Tanker F.P. exceeding 60°C in No. 4 tanks ESP Baltic Service Ice Class 1B'.

2.3.2 Details of the ship types and particular cargoes for which special Rules apply are given in those Chapters of Pt 3 Ship Structures (General), Pt 4 Ship Structures (Ship Types) and Pt 7 Other Ship Types and Systems which apply to such ships and cargoes.

2.3.3 Details of the more common special features and the conditions relevant to the assignment of special features notations, together with the form of such notations, are incorporated in Pt 3 Ship Structures (General), Pt 4 Ship Structures (Ship Types) and Pt 7 Other Ship Types and Systems as applicable.

2.3.4 Service restriction notations will generally be assigned in one of the forms shown in Pt 1, Ch 2, 2.3 Class notations (hull) to Pt 1, Ch 2, 2.3 Class notations (hull), but this does not preclude Owners or Shipbuilders requesting special consideration for other forms in unusual cases.

2.3.5 Where a service notation is applicable, certain exemptions may be granted. Where these affect statutory requirements, such as Load Lines, the Owner or shipbuilder is to obtain the authorisation of the Flag State. Such exemptions are to be recorded on the Class certificate and any applicable statutory certificate.

2.3.6 **Protected waters service.** Service in sheltered water adjacent to sand banks, reefs, breakwaters or other coastal features, and in sheltered water between islands, e.g. 'Protected Waters Service at Storebaelt Bridge'.

2.3.7 **Extended protected waters service.** Service in protected waters and also for short distances (generally less than 15 nautical miles) beyond protected waters in 'reasonable weather', e.g. 'Extended Protected Waters Service from the Port of Lagos'.

2.3.8 **Specified coastal service.** Service along a coast, the geographical limits of which will be indicated in the *Register Book*, and for a distance out to sea generally not exceeding 21 nautical miles, unless some other distance is specified for 'coastal service' by the Administration with which the ship is registered, or by the Administration of the coast off which it is operating, as applicable, e.g. 'Indonesian coastal service'.

2.3.9 **Specified route service.** Service between two or more ports or other geographical features which will be indicated in the *Register Book*,

e.g.

- 'London to Rotterdam service'
- 'London, Rotterdam and Hamburg service'.

2.3.10 **Specified operating area service.** Service within one or more geographical area(s) which will be indicated in the *Register Book*,

e.g.

- 'Pacific Tropical Zone service'
- 'Great Lakes and St. Lawrence to Pt. du Monts service'
- 'Red Sea, Eastern Mediterranean and Black Sea service'.

2.3.11 ***IWS.** This notation (In-water Survey) may be assigned to a ship where the applicable requirements of LR's Rules and Regulations are complied with, see Pt 1, Ch 3, 4.3 In-water Surveys; Pt 3, Ch 1, 5.2 Plans and supporting calculations and Pt 3, Ch 1, 5.3 Plans to be supplied to the ship; Pt 3, Ch 2, 3.5 External hull protection; Pt 3, Ch 13, 2.9 Pintles and Pt 5, Ch 6, 3.12 Sternbushes. The notation will be withdrawn for **ESP** ships upon reaching 15 years of age.

2.3.12 **ESP.** This notation (Enhanced Survey Programme) will be assigned to oil tankers, combination carriers, chemical tankers, bulk carriers and ore carriers, as defined in Pt 1, Ch 3, 1.5 Definitions which are subject to an enhanced survey programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements, Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements and Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements.

2.3.13 **CSR.** This notation will be assigned to bulk carriers and double hull oil tankers compliant with the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR)*, see Pt 4, Ch 7, 1.2 Application and Pt 4, Ch 9, 1.2 Application and ship arrangement. Additional mandatory and non-mandatory class notations for CSR bulk carriers are given in Pt 1, Ch 2, 2.3 Class notations (hull).

2.3.14 **Class notations for CSR bulk carriers.** In general, CSR bulk carriers less than 150 m in length are to comply with the requirements of Pt 4, Ch 7, 1.4 Class notation for CSR bulk carriers and the *IACS Common Structural Rules (CSR)* and will be eligible for one of the following mandatory class notations:

{any holds may be empty}	This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1,0 tonne/m ³ and above, with an approved arrangement of loaded holds such that any hold may be empty at the maximum draught.
{holds a, b, ... may be empty}	This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1,0 tonne/m ³ and above with specified holds empty at maximum draught.

In general, CSR bulk carriers equal to or greater than 150 m in length are to comply with the requirements of Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers and the *IACS Common Structural Rules (CSR)* and will be eligible for one of the following mandatory class notations:

BC-A, {holds a, b, ... may be empty}	This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1,0 tonne/m ³ and above with specified holds empty at maximum draught.
BC-B	This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1,0 tonne/m ³ and above with all cargo holds loaded.
BC-C	This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1,0 tonne/m ³ with all cargo holds loaded.

The following additional notations and annotations are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design:

(maximum cargo density (in tonnes/m³))	For notations BC-A and BC-B if the maximum cargo density is less than 3,0 tonnes/m ³
(no MP)	For all notations when the vessel has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in <i>IACS Common Structural Rules (CSR)</i> , Pt 1, Ch 4, Sec 8,4.2.2;
GRAB [X]	Where the net thickness of plating of inner bottom, hopper tank sloping plate, transverse lower stool, transverse bulkhead plating and inner hull up to a height of 3,0 m above the lowest point of the inner bottom, excluding bilge wells comply with <i>IACS Common Structural Rules (CSR)</i> , Pt 2, Ch 1, 6 for BC-A and BC-B, see <i>IACS Common Structural Rules (CSR)</i> , Pt 1, Ch 1, Sec 1,3.2.1;
(allowed combination of specified empty holds)	Annotation for notation BC-A .

2.3.15 **ESN.** This notation (Enhanced Survivability Notation) will be assigned to non-**CSR** bulk carriers which are designed to withstand the individual flooding of all cargo holds, see Pt 4, Ch 7, 1.3 General class notations.

2.3.16 **LI.** This notation will be assigned where an approved loading instrument has been installed as a classification requirement.

2.3.17 **ShipRight ().** Where one or more of LR's ShipRight procedures for the following have been satisfactorily applied, then a notation showing the associated characters of the procedure(s) within brackets will, at the Owner's request, be entered in column 4 of the *Register Book*, preceded by the word **ShipRight**, e.g. **ShipRight(CM, SDA, FDA plus(25,NA))**. The requirements pertaining to these notations and the ShipRight procedures are given in Pt 3, Ch 16 ShipRight Procedures for the Design, Construction and Lifetime Care of Ships.

ACS() This ShipRight notation (Anti-Corrosion System) will be assigned when a specified area or areas of the ship have been protected against corrosion in accordance with the relevant ShipRight procedures. The **ACS()** notation with the extension of one or more of the following associated supplementary characters shown in brackets, detailing the specified protected area or areas, may be assigned;

- B** for protective coating system of water ballast tanks;
- D** for protective coating system of double-side skin spaces;
- C** for protective coating system of cargo oil tanks;
- C*** when corrosion resistant steel has been used in cargo oil tanks;
- V** for protective coating system of void spaces.

CM This ShipRight notation (Construction Monitoring), which complements the ShipRight **SDA, FDA, FDA plus()**, **FDA ICE, FDA SPR**, and **WDA** notations, will be assigned when the controls in construction tolerances detailed in the relevant ShipRight procedures have been applied and verified. The ShipRight notation **CM** is mandatory upon application of any of the following ShipRight notations: **SDA, FDA, FDA plus()**, **FDA ICE, FDA SPR** and **WDA**

FDA This ShipRight notation (Fatigue Design Assessment) will be assigned when an appraisal has been made of the fatigue performance of the hull structure in accordance with the relevant ShipRight procedures.

FDA plus() This ShipRight notation (Fatigue Design Assessment plus) will be assigned when an appraisal has been made for a higher level of fatigue performance than that made for the assignment of **FDA**. The appraisal may be made based upon a specific trading pattern, which is to be expressed in terms of either a Worldwide trading route, as defined in the relevant ShipRight procedures, or a North Atlantic trading route (that utilises the wave data from IACS Recommendation 34). The ShipRight notation **FDA plus()** is to be followed by the number of years that the vessel has been assessed for the specific trading pattern shown in brackets, for either the Worldwide or North Atlantic trading routes, denoted by **WW** and **NA** respectively, e.g. **FDA plus (25, NA)**.

FDA ICE This ShipRight notation (Fatigue Design Ice) will be assigned when an appraisal has been made for the fatigue performance of the hull structure when navigating through ice in accordance with the relevant ShipRight procedures.

FDA SPR This ShipRight notation (Springing Fatigue Assessment) will be assigned when an appraisal has been made of the fatigue performance of the hull structure taking into account the effects due to springing (the continuous vibrational response of the hull girder due to waves) in accordance with the relevant ShipRight procedures.

SDA This ShipRight notation (Structural Design Assessment) will be assigned when direct calculations in accordance with the relevant ShipRight procedures have been applied. The ShipRight notation **SDA** is mandatory upon application of any of the following ShipRight notations: **FDA, FDA plus(), FDA ICE, FDA SPR** and **WDA**.

WDA This ShipRight notation (Whipping Design Assessment) will be assigned when an appraisal has been made of the vibrational response of the hull structure due to wave impact loads (Whipping) in accordance with the relevant ShipRight procedures.

2.3.18 When the ShipRight notations **SDA, FDA, FDA plus(), FDA ICE, FDA SPR**, and **WDA** are assigned, the precise technical conditions of the appraisal will be made available to Owners.

2.3.19 **EU notations.** The following notations may be assigned to passenger ships that comply with the requirements of the European Council Directive 98/18/EC of 17 March 1998 on safety Rules and Standards for passenger ships, and subsequent revisions:

EU(A)	This class notation will be assigned to a passenger ship engaged on domestic voyages other than voyages covered by Classes B, C and D.
EU(B)	This class notation will be assigned to a passenger ship engaged on domestic voyages in the course of which it is at no time more than 20 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.
EU(C)	This class notation will be assigned to a passenger ship engaged on domestic voyages in sea areas where the probability of exceeding 2,5 m significant wave height is smaller than 10 per cent over a one-year period for all-year-round operation, or over a specific restricted period of the year for operation exclusively in such a period (e.g. summer period operation), in the course of which it is at no time more than 15 miles from a place of refuge, nor more than 5 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.
EU(D)	This class notation will be assigned to a passenger ship engaged on domestic voyages in sea areas where the probability of exceeding 1,5 m significant wave height is smaller than 10 per cent over a one-year period for all-year-round operation, or over a specific restricted period of the year for operation exclusively in such a period (e.g. summer period operation), in the course of which it is at no time more than 6 miles from a place of refuge, nor more than 3 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.

2.3.20 The following notations may be assigned to ships that comply with standards for noise and vibration levels in different spaces at the time of delivery and during the ship's life if substantial changes to the machinery installation or interior arrangements are made.

PAC	Passenger Accommodation Comfort. This notation indicates that the passenger accommodation meets the acceptance criteria.
CAC	Crew Accommodation Comfort. This notation indicates that the crew accommodation and work areas meet the acceptance criteria.
PCAC	Passenger and Crew Accommodation Comfort. This notation indicates that the passenger and crew spaces both meet the acceptance criteria.

Following the **PAC** or **CAC** notation, numerals 1, 2 or 3 will indicate the acceptance criteria to which the noise and vibration levels have been assessed. In the case of the **PCAC** notation, two numerals will be assigned. The first will indicate the acceptance criteria for passenger accommodation, whilst the second will indicate the crew comfort criteria. These notations are optional and are primarily intended to apply to passenger ships. Spaces that comply with the minimum Rule requirement for noise levels indicated in Pt 7, Ch 12 Passenger and Crew Accommodation comfort, will meet the requirements of section 4 of IMO Resolution MSC.337(91), when measured in accordance with the requirements of Chapters 2 and 3 of that Resolution

2.3.21 The notation **EPN** (escort performance numeral) may be assigned to escort tugs which carry out full-scale performance trials in accordance with the requirements of Pt 4, Ch 3, 9.3 Performance numeral and trials. **(F,B,V,C)** may be appended to the notations where:

F	Maximum steering force, in tonnes.
B	Maximum braking force, in tonnes.
V	Speed, in knots, at which F and B are determined.
C	Time, in seconds, required for the escort tug in manoeuvring from maintained oblique position of the tug giving it a maximum steering force on one side of the assisted vessel to a mirror position on the other side.

2.4 Class notations (machinery)

2.4.1 The following class notations are associated with the machinery construction and arrangement, and may be assigned as considered appropriate by the Classification Committee:

✱ **LMC** This notation will be assigned when the propelling and essential auxiliary machinery, see Pt 1, Ch 2, 2.9 Application notes, have been constructed, installed and tested under LR's Special Survey and in accordance with LR's Rules and Regulations for the Classification of Ships, see Pt 1, Ch 2, 3.2 New construction surveys.

[✱] **LMC** This notation will be assigned when:

- the propelling arrangements for propellers, propulsion shafting and multiple input/output gearboxes, steering systems, pressure vessels and electrical equipment for essential systems have been constructed, installed and tested under LR's Special Survey and are in accordance with LR's Rules and Regulations, see Pt 1, Ch 2, 3.2 New construction surveys.
- other items of machinery and gearing arrangements for propulsion and electrical power generation and other auxiliary machinery for essential services are in compliance with LR Rules and supplied with the Manufacturer's certificate, see Pt 1, Ch 2, 2.9 Application notes.
- the system arrangements of propelling and essential auxiliary machinery, see Pt 1, Ch 2, 2.9 Application notes, are appraised and found to be acceptable to LR.

✱ **LMC** This notation will be assigned to existing ships in service that will be accepted or transferred into LR class when:

- the propelling and essential auxiliary machinery, see Pt 1, Ch 2, 2.9 Application notes, have neither been constructed nor installed under LR's Special Survey.
- the existing machinery installation and arrangement have been tested and found to be acceptable to LR.

MCH This notation will be assigned when the:

- propelling and essential auxiliary machinery, see Pt 1, Ch 2, 2.9 Application notes, has been installed and tested under LR's survey and found to be acceptable to LR.
- propelling and essential auxiliary machinery has been supplied with a Manufacturer's certificate, see Pt 1, Ch 2, 2.9 Application notes.
- system arrangements of propelling and essential auxiliary machinery, see Pt 1, Ch 2, 2.9 Application notes, are appraised and found to be acceptable to LR.

IGS This notation will be assigned when a ship intended for the carriage of oil in bulk, or for the carriage of liquid chemicals in bulk, is fitted with an approved system for producing gas for inerting the cargo tanks.

2.4.2 The following class notations are associated with the machinery control and automation, and may be assigned as considered appropriate by the Classification Committee:

UMS This notation may be assigned when the arrangements are such that the ship can be operated with the machinery spaces unattended. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

CCS This notation may be assigned when the arrangements are such that the machinery may be operated with continuous supervision from a centralised control station. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

ICC This notation may be assigned when the arrangements are such that the control and supervision of ship operational functions are computer based. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

IP This notation may be assigned to a ship classed with LR when the arrangements of the machinery are such that the propulsion equipment and all the essential auxiliary machinery is integrated with the power unit for operation under all normal sea-going and manoeuvring conditions. The system is to be bridge controlled and the propulsion equipment is to incorporate an emergency means of propulsion in the event of failure in the prime mover. It also denotes that the machinery and control equipment have been arranged, installed and tested in accordance with LR's Rules.

2.4.3 The following class notations are associated with dynamic positioning arrangements, and may be assigned as considered appropriate by the Classification Committee:

DP(CM) This notation may be assigned when a ship is fitted with centralised remote manual controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

DP(AM) This notation may be assigned when a ship is fitted with automatic main and manual standby controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the machinery and control engineering has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

DP(AA) This notation may be assigned when a ship is fitted with automatic main and automatic standby controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

DP(AAA) This notation may be assigned when a ship is fitted with automatic main and automatic standby controls for position keeping, together with an additional/emergency automatic control unit located in a separate compartment and with position

reference systems and environmental sensors. It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

PCR00 This rating supplements the DP0 notation. This rating indicates the calculated percentage of time that a unit is capable of holding heading and position under a standard set of environmental conditions (North Sea).

Two rating numerals are calculated:

- The first numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with all thrusters operating.
- The second numeral represents the percentage of time that the ship can remain on station when subjected to a set of standard environmental conditions (North Sea fully developed) with the most effective thruster being inoperative.
- A typical rating might be (95),(70).

The foregoing dynamic positioning notations may be supplemented with a Performance Capability Rating (PCR). This rating indicates the calculated percentage of time that a ship is capable of holding heading and position under a standard set of environmental conditions (North Sea), see Pt 7, Ch 4 Dynamic Positioning Systems.

2.4.4 The following class notations are associated with navigation safety, and may be assigned as considered appropriate by the Classification Committee:

NAV1 This notation will be assigned when the bridge layout and level of equipment are such that the ship is considered suitable for safe periodic operation under the supervision of a single watchkeeper on the bridge. It denotes that the navigational installation has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

IBS This additional notation will be assigned where an integrated bridge system is fitted to provide electronic chart display, track planning and automatic track following, centralised navigation information display, and bridge alarm management. It denotes that the integrated bridge system has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto. For assignment of this notation, in addition to satisfying LR Rules, or equivalent thereto, for navigational function integration:

- the layout of the bridge and the equipment located on the bridge is to satisfy the requirements of a relevant International or National Ergonomic or Human-centred Design Standard, or an acceptable equivalent, to the satisfaction of LR; or
- the notation **NAV1** is also to be assigned; or
- where the bridge is not intended to operate a periodic one man watch, the layout of the bridge and the equipment on the bridge are to satisfy the requirements for the assignment of the notation **NAV1** to the satisfaction of LR with the exception of requirements identified by LR Rules that may be relaxed in such cases.

2.4.5 Machinery class notations will not be assigned to ships the hulls of which are not classed or intended to be classed with LR.

2.4.6 The notations **⌘ LMC**, **[⌘] LMC**, **⌘ LMC** and **MCH** will, in general, not be assigned to non-propelled craft, but individual cases will be considered on their merits.

Table 2.2.4: Machinery Class Notations

Machinery Notations See 2.4, Pt 1, Ch 2, 2.5 Class notations (machinery special features), Pt 1, Ch 2, 2.6 Class notations (refrigerated cargo installations (RMC), controlled atmosphere (CA) systems and carriage of refrigerated containers (CRC))		
⌘ LMC Propulsion and essential machinery	OPS Operation of Services by connection to an external electrical Power Supply	⌘ Lloyd's LMC Refrigerated Machinery
[⌘] LMC Propulsion and essential machinery	PM Positional Mooring System	Lloyd's LMC Refrigerated Machinery
⌘ LMC Propulsion and essential machinery	PMC Positional Mooring System for mooring in Close proximity to other vessels or installations	‡ Double Dagger – Suitable for carriage of fruit

Classification Regulations

Part 1, Chapter 2

Section 2

MCH Propulsion and essential machinery	GF Natural Gas Fuelled Ships	✱ Lloyd's RMC (LG) Reliquefaction and/or refrigeration equipment is fitted
IGS Inert Gas System	PMR Propulsion System Redundancy	Lloyd's RMC (LG) Reliquefaction and/or refrigeration equipment is fitted
UMS Unattended Machinery Spaces	PSMR Propulsion and Steering System Redundancy	✱ Lloyd's RMC (BC) Refrigerated Chemical tanker
CCS Centralised Control Station	PSMR* Propulsion and Steering System Redundancy in Separate Compartments	Lloyd's RMC (BC) Refrigerated Chemical Tanker
ICC Integrated Computer Control	PMRL Propulsion System Redundancy with Limited Capacity	TC Chemical Tanker temperature Control Systems
IP Integrated Propulsion	PMRL* Propulsion System Redundancy in Separate Compartments with Limited Capacity	(CA) Controlled Atmosphere
DP(CM) Dynamic Position (Centralised Remote Manual Controls)	SMRL Steering System Redundancy with Limited Capacity	CA (%O₂, %CO₂) Controlled Atmosphere
DP(AM) Dynamic Position (Automatic main and Manual standby Controls)	SMRL* Steering System Redundancy in Separate Compartments with Limited Capacity	RH Relative Humidity
DP(AA) Dynamic Position (Automatic main and Automatic standby Controls)	PSMRL Propulsion and Steering System Redundancy with Limited Capacity	
DP(AAA) Dynamic Positioning (Automatic main and Automatic standby controls with additional/emergency Automatic control)	PSMRL* Propulsion and Steering System Redundancy in Separate Compartments with Limited Capacity	
PCR(0) Performance Capability Rating	CAC1(1 or 2 or 3) Crew Accommodation Comfort	
NAV1 Navigation Equipment	PAC1 (or 2 or 3) Passenger Accommodation Comfort	
IBS Integrated Bridge System	PCAC1 (or 2 or 3), 1 (or 2 or 3) Passenger and Crew Accommodation	

2.5 Class notations (machinery special features)

2.5.1 The following class notation is associated with onshore power supply arrangements and may be assigned as considered appropriate by the Classification Committee, upon application from the Owners:

OPS Assigned when the machinery, electrical and control engineering arrangements installed on board to permit continued operation of services by connection to an external electrical power supply have been assessed.

2.5.2 The following class notations are associated with positional mooring systems, or thruster-assisted positional mooring systems, and may be assigned as considered appropriate by the Classification Committee:

- PM** Assigned when a positional mooring system is fitted. It is not intended to apply to vessels which have station-keeping capabilities, but which are not required to remain on station in adverse weather conditions. This notation can be supplemented by a Thrust-Assisted notation **(T1)** [or **(T2)** or **(T3)**].
- PMC** Assigned when a positional mooring system for mooring in close proximity to other vessels or installations is fitted. It is not intended to apply to vessels which have station-keeping capabilities, but which are not required to remain on station in adverse weather conditions. This notation can be supplemented by a Thrust-Assisted notation **(T1)** [or **(T2)** or **(T3)**].

2.5.3 The following class notations are associated with machinery redundancy and may be assigned as considered appropriate by the Classification Committee:

- PMR** This notation will be assigned where the main propulsion systems are arranged such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.
- PMR*** This notation will be assigned where the main propulsion systems are arranged such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and where the machinery is installed in separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.
- SMR** This notation will be assigned where the steering systems for manoeuvring are arranged so that steering capability will continue to be available in the event of a single failure in the steering gear equipment or loss of power supply or control system for any steering system. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.
- SMR*** This notation will be assigned where the steering systems for manoeuvring are arranged so that steering capability will continue to be available in the event of a single failure in the steering gear equipment or loss of power supply or control system for any steering system and where the steering systems are installed in separate compartments such that, in the event of the loss of one compartment, steering capability will continue to be available. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.
- PSMR** This notation will be assigned where the main propulsion and steering systems are configured such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.
- PSMR*** This notation will be assigned where the main propulsion and steering systems are configured such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability. The propulsion and steering arrangements are to be installed in separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.

The foregoing machinery redundancy notations may be supplemented with the additional **L** character which indicates a limited capability.

2.5.4 The following class notations are associated with comfort control and may be assigned as considered appropriate by the Classification Committee:

- CAC1** (or **2** or **3**)
Assigned when noise and vibration levels in crew accommodation and work areas have been assessed. Numerals **1** or **2** or **3** indicate the acceptance criterion to which the noise and vibration levels have been assessed. Primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance.
- PAC1** (or **2** or **3**)
Assigned when noise and vibration levels in passenger accommodation have been assessed. Numerals **1** or **2** or **3** indicate the acceptance criterion to which the noise and vibration levels have been assessed. Primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance.

PCAC1 (or **2** or **3**), (**1** or **2** or **3**)

Assigned when noise and vibration levels in passenger and crew spaces have been assessed. Numerals **1** or **2** or **3** indicate the acceptance criterion to which the noise and vibration levels have been assessed. Two numerals will be assigned, the first for the acceptance criteria for passenger accommodation, the second for crew comfort criteria. Primarily intended to apply to passenger ships. If requested, however, any ship can be assessed for compliance.

2.5.5 The following class notation is associated with gas-fuelled vessels and may be assigned as considered appropriate by the Classification Committee:

GF Assigned to ships other than LNG carriers, where the main propelling and/or auxiliary machinery is designed to operate on natural gas as fuel, or a combination of natural gas and fuel oil. The notation also indicates that the gas-fuelled machinery has been installed and tested in accordance with LR's Rules and Regulations.

2.6 **Class notations (refrigerated cargo installations (RMC), controlled atmosphere (CA) systems and carriage of refrigerated containers (CRC))**

2.6.1 The following class notations may be assigned as considered appropriate by the Classification Committee, on application from the Owners:

✱ **Lloyd's RMC** This notation will be assigned when a refrigerated cargo installation has been constructed, installed and tested under LR's Special Survey and in accordance with the relevant requirements of the Rules.

Lloyd's RMC This notation will be assigned when the arrangements of the refrigerated cargo installation have been found to be equivalent to Rule requirements, and the installation has been tested in accordance with the relevant requirements of the Rules.

‡ This symbol will be assigned to installations considered suitable for the carriage of fruit. It indicates that the following parameters have been assessed and found satisfactory:

- (a) The rate of air circulation and the air refreshing arrangements through the refrigerated spaces or chambers, or to containers.
- (b) The temperature controls and monitoring arrangements.
- (c) The installation's capability to cool down a complete cargo of fruit to its carrying temperature within a specified time. The symbol will also be assigned to fishing vessels that have the refrigerating capacity to freeze down their catch.

✱ **Lloyd's RMC (LG)** This notation will be assigned to a classed liquefied gas carrier or tanker, in which reliquefaction or refrigeration equipment is approved and fitted for cargo temperature and pressure control where the equipment has been constructed, installed and tested in accordance with the relevant requirements of the Rules.

Lloyd's RMC (LG) This notation will be assigned to a classed liquefied gas carrier or tanker, in which reliquefaction or refrigeration equipment is fitted for cargo temperature and pressure control, where the equipment has been found equivalent to Rule requirements and tested in accordance with the relevant requirements of the Rules.

✱ **Lloyd's RMC (BC)** Assigned to a classed chemical tanker in which refrigeration equipment has been constructed, installed and tested, in accordance with the relevant requirements of the Rules.

Lloyd's RMC (BC) Assigned to a classed chemical tanker where the equipment has been found equivalent to Rule requirements and tested in accordance with the relevant requirements of the Rules.

TC Assigned to a classed chemical tanker where the temperature control systems have been found equivalent to Rule requirements and tested in accordance with the relevant requirements of the Rules.

2.6.2 The following class notations are associated with controlled atmospheres and may be assigned as considered appropriate by the Classification Committee, on application from Owners, see *also* Pt 7, Ch 1 Controlled Atmosphere Systems:

(CA) This notation may be assigned when a ship is fitted with arrangements for maintaining airtightness in CA zones and for the ready connection to a gas system in accordance with the relevant requirements of the Rules.

CA (%O₂, %CO₂) This notation may be assigned when a ship is provided with a CA system which will achieve and maintain specified ranges of oxygen and carbon dioxide levels in accordance with the relevant requirements of the Rules.

RH This notation may be assigned when a ship can maintain a specified relative humidity in the CA zones.

RPA Assigned to ships where the Refrigeration Machinery for Provision Stores and Air-conditioning comply with the applicable requirements of Pt 7, Ch 15 Refrigeration Systems and Equipment Serving Provision Stores and Air-Conditioning Installations.

Before assignment of any of the above notations it is a prerequisite that the refrigeration installation is assigned an **RMC** class notation.

2.6.3 The following class notation is associated with the carriage of refrigerated cargo containers and may be assigned as considered appropriate by the Classification Committee, on application from Owners, see *also* Pt 7, Ch 10 Carriage of Refrigerated Containers:

✱ **CRC** This notation may be assigned when a ship is provided with a ventilation system which is approved, installed and tested in accordance with the relevant requirements of the Rules.

2.6.4 The class notation assigned will additionally specify the temperature conditions and other relevant characteristics for which the equipment has been approved, see Pt 6, Ch 3 Refrigerated Cargo Installations.

2.6.5 The class notation assigned will be maintained as long as the installation is found, at the prescribed Periodical Surveys, to be in a fit and efficient condition, and in accordance with the requirements of the Rules.

2.6.6 The Classification Committee will give consideration to ships engaged on voyages of short duration, to installations of small capacity, or to other special circumstances. In such cases the class may include a service limitation or other restriction.

2.6.7 Refrigerating installations designed to supply refrigerated air to insulated containers in ships' holds aboard container ships, are eligible for classification. The installation is to include the refrigerating machinery, supply and return air ducting, and the flexible couplings between containers and the duct system. Where the arrangements are such that cell air conditioning is essential to the carriage of the containers, the air conditioning equipment and/or insulation of the hold, deckheads, sides and tank tops are to be included in the classification.

2.6.8 Other methods of carrying refrigerated cargoes in containers aboard container ships will be considered for classification on application.

2.7 Class notations (Environmental Protection)

2.7.1 The following class notations are associated with the design and operation of a ship and may be assigned as considered appropriate by the Classification Committee, on application from the Owners:

ECO This notation will be assigned when a ship is designed and operated in accordance with the relevant requirements of the Rules.

ECO(TOC) This notation will be assigned when the environmental protection arrangements are in accordance with the requirements of another recognised classification society and are essentially equivalent to Rule requirements and the ship is operated in accordance with the relevant requirements of the Rules.

2.8 Descriptive notes

2.8.1 In addition to any class notations, an appropriate descriptive note may be entered in column 6 of the *Register Book* indicating the type of ship in greater detail than is contained in the class notation, and/or providing additional information about the ship's design and construction. This descriptive note is not an LR class notation and is provided solely for information.

2.8.2 **ShipRight()**. Where one or more of LR's ShipRight procedures for the following have been satisfactorily applied, then a descriptive note showing the associated characters of the procedure(s) within brackets will, at the Owner's request, be entered in column 6 of the *Register Book*, preceded by the word **ShipRight**, e.g. **ShipRight(IHM, SERS)**. The requirements pertaining to these descriptive notes and the ShipRight procedures are given in Pt 3, Ch 16 ShipRight Procedures for the Design, Construction and Lifetime Care of Ships and Pt 5, Ch 21 Requirements for Condition Monitoring Systems and Machinery Condition-Based Maintenance Systems.

BWMP()	<p>This ShipRight descriptive note (Ballast Water Management Plan) will be assigned, when the requirements in accordance with the relevant ShipRight procedures have been complied with. The descriptive note BWMP() with the extension of one or more of the following associated supplementary characters shown in brackets, detailing the method(s) used, may be assigned:</p> <ul style="list-style-type: none"> S sequential method; F flow through method; D dilution method; T treatment method.
DIST()	<p>This ShipRight descriptive note (Machinery suitable for operation on Distillate Fuels) will be assigned when specified machinery items are suitable for operation on distillate fuels, in accordance with the relevant ShipRight procedures. The DIST() descriptive note with the extension of one or more of the following associated supplementary characters shown in brackets, detailing the specified machinery items, may be assigned:</p> <ul style="list-style-type: none"> M main engine(s); AB auxiliary engines and boiler; I incinerator; IG inert gas generator.
E	<p>This ShipRight descriptive note (Evidence) will be assigned, where evidence exists that supporting calculations have been performed in accordance with hull structural finite element and fatigue analysis procedures of a recognised classification society. This descriptive note can be assigned to vessels transferring class or to new builds where the design has been appraised by another recognised classification society.</p>
ES()	<p>This ShipRight descriptive note (Enhanced Scantlings) will be assigned, where scantlings in excess of the approved Rule minimum are fitted at defined locations in accordance with the relevant ShipRight procedures. The added thickness measurement in mm is to be shown with a description of the location(s) in brackets e.g. ShipRight(ES(+1 Strength Deck, +2 Bottom Shell)).</p>
IHM	<p>This ShipRight descriptive note (Inventory of Hazardous Materials) will be assigned when the requirements in accordance with the relevant ShipRight procedures have been complied with.</p>
PCWBT()	<p>This ShipRight descriptive note (Protection Coatings in Water Ballast Tanks) will be assigned, to indicate that all sea-water ballast spaces having boundaries formed by the hull envelope have a corrosion protection coating applied, and that the coating remains efficient and is maintained in good condition. The month and year that the coating is approved is to be appended to the descriptive note within brackets.</p>
SEA()	<p>This descriptive note (Ship Event Analysis) will be assigned, where hull surveillance systems for monitoring of the ship's hull girder stresses and motions have been fitted and are in compliance with the relevant ShipRight procedures. The ShipRight descriptive note is to be appended by HSS followed by the number of strain gauges fitted shown in brackets. In addition the extension of one or more of the following associated supplementary characters may be shown e.g. ShipRight(SEA(HSS-2, VDR)):</p> <ul style="list-style-type: none"> L The display of the relevant information in the cargo control area; M The display and recording of the ship's motion; N The facility to display and record navigational information; VDR An interface with the ship's voyage data recorder system to enable the recording of hull stress, ship motion and hull pressure information.
SEA ICE	<p>This ShipRight descriptive note (Ship Event Analysis Ice) will be assigned when the ship has been provided with a hull surveillance system that can display and record local ice load induced stresses from a series of strain gauges in the bow region.</p>
SERS	<p>This ShipRight descriptive note (Ship Emergency Response Service) will be assigned when a Ship is registered with LR's Ship Emergency Response Service.</p>
SCM	<p>This ShipRight descriptive note (Screwshaft Condition Monitoring) will be assigned where an Owner adopts the requirements for monitoring of the screwshaft. The descriptive note will indicate that equipment and procedures are in place to determine the physical and operational condition of that equipment.</p>

SRtP	This ShipRight descriptive note (Safe Return to Port and Orderly Evacuation) is to be applied where the design appraisal and survey of the vessel has been performed in accordance with the relevant ShipRight procedures for vessels required to comply with Safe Return to Port and Orderly Evacuation.
TCM	This ShipRight descriptive note (Main Steam Turbine Condition Monitoring) will be assigned where an Owner adopts the requirements for monitoring of the main steam turbine. The descriptive note will indicate that equipment and procedures are in place to determine the physical and operational condition of that equipment. Further information is provided in the LR document <i>ShipRight Procedure Machinery Planned Maintenance and Condition Monitoring</i> .
MCM	This ShipRight descriptive note (Machinery Condition Monitoring) will be assigned where an Owner operates an approved Planned Maintenance Scheme as part of the Continuous Survey Machinery (CSM) cycle, and monitoring techniques and equipment are used to record the condition against agreed acceptable limits. The descriptive note will indicate that equipment, procedures and documentation are in place to monitor, control and record the physical and operational condition of the equipment on the ship and control the maintenance routines accordingly. For the design and installation of machinery condition monitoring systems which form part of a machinery planned maintenance scheme approved by LR for the assignment of the descriptive note, the requirements of Pt 5, Ch 21 Requirements for Condition Monitoring Systems and Machinery Condition-Based Maintenance Systems are applicable.
MCBM	This ShipRight descriptive note (Machinery Condition-Based Maintenance) will be assigned where an Owner operates an approved Planned Maintenance Scheme based on the use of Condition-based Maintenance as part of the Continuous Survey Machinery (CSM) cycle. The descriptive note will indicate that procedures and documentation are in place to control and record the inspection and maintenance routines of all surveyable machinery and equipment. The Scheme is to be based on acceptable and applicable modes of failure analysis and risk assessment approved by LR. For the design and installation of machinery condition monitoring systems which form part of a Machinery Condition based Maintenance scheme approved by LR for the assignment of the descriptive note, the requirements of Pt 5, Ch 21 Requirements for Condition Monitoring Systems and Machinery Condition-Based Maintenance Systems are applicable.
MPMS	This ShipRight descriptive note (Machinery Planned Maintenance Scheme) will be assigned where an Owner operates an approved Machinery Planned Maintenance Scheme as part of the Continuous Survey Machinery (CSM) cycle. The descriptive note will indicate that procedures and documentation are in place to control and record the inspection and maintenance routines of all machinery and equipment in the ship.
RCM	This ShipRight descriptive note (Reliability Centred Maintenance) will be assigned where an Owner operates an approved Planned Maintenance Scheme based on the use of Reliability Centred Maintenance as part of the Continuous Survey Machinery (CSM) cycle. The descriptive note will indicate that procedures and documentation are in place to control and record the inspection and maintenance routines of all machinery and equipment in the ship, and that they are based on acceptable and applicable methodology.
VECS	This ShipRight descriptive note (Vapour Emission Control System) will be assigned to a ship that has a vapour emission control system fitted which has been designed and constructed in accordance with the requirements of USCG 46, CFR 39 or the IMO Standards for Vapour Emission Control Systems (MSC Circular 585).
VECS-L	This ShipRight descriptive note (Vapour Emission Control System – Lightering) will be assigned to a ship that has a vapour emission control system that complies with the requirements for the VECS Descriptive Note and which has also been designed and constructed to meet the requirements for vapour balancing in accordance with USCG 46, CFR 39.40 for service vessels. If a ship has been assigned the ECO notation then it will not be eligible for the VECS-L Descriptive Note. Instead, VECS for lightering will be referenced in the ECO notation, i.e. ECO(VECS-L) .

2.8.3 Where an approved loading instrument is provided as an Owner's requirement, a descriptive note **LI** may be entered in column 6 of the *Register Book*, see also Pt 1, Ch 2, 2.3 Class notations (hull).

2.8.4 Where container securing arrangements are designed and constructed in accordance with Pt 3, Ch 14 Cargo Securing Arrangements, but where the Initial and Periodical Survey requirements for loose fittings are not requested, the ship will be eligible to be assigned the descriptive note **CSA** (container securing arrangement) and for an entry to be made in column 6 of the *Register Book*.

2.8.5 **EDD**. Vessel is eligible for the Owner/Operator to apply to the Flag Administration for the vessel to be placed on a pilot Extended Dry-Docking regime. The relevant Flag Administration may elect to impose requirements additional to those defined as per this descriptive note. Vessels are to comply with the LR Guidance notes on Extended Dry- Dockings.

2.8.6 **STV**. Where a sailing vessel is used for the offshore training of cadets or trainee seamen, a sailing training vessel **STV** descriptive note may be entered in column 6 of the *Register Book*.

2.8.7 **GR.** Assigned to ships other than LNG carriers, detailing the aspects of design and construction that are prepared for gas fuel operation in accordance with LR's Rules and Regulations in force on the date of 'contract for construction'. If a ship has been assigned the **GF** notation then it will not be eligible for the **GR** descriptive note. The descriptive note **GR**, with the extension of one or more of the following associated characters shown in brackets, may be entered in column 6 of the *Register Book*.

A	The design of the gas fuel system has been approved in principle.
S	Enhanced structural reinforcement and appropriate materials have been fitted to support the proposed gas storage tank.
T	Fuel storage arrangements installed in accordance with an approved design.
P	Gas fuel piping arrangements installed in accordance with an approved design.
E	Engineering systems have been installed in accordance with an approved design. Additional letters will be assigned in brackets to identify which items may be gas-fuelled:
	M = main engine(s)
	A = auxiliary engines
	B = boiler
	I = incinerator

See LR's *Rules and Regulations for the Classification of Natural Gas Fuelled Ships*, Ch 1, 1.2 Class notation and descriptive note for further detail.

2.9 Application notes

2.9.1 **Propelling and essential auxiliary machinery** includes machinery, equipment and systems installed for the ship to be under seagoing conditions and that are necessary for the following:

- Maintaining the watertight and weathertight integrity of the hull and spaces within the hull.
- The safety of the ship, machinery and personnel on board.
- The functioning and dependability of propulsion, steering and electrical systems.
- The operation and functioning of control engineering systems for the monitoring and safety of propulsion and steering systems.
- The operation and functioning of emergency machinery and equipment.

2.9.2 **Manufacturer's certificate** for assignment of the [✖] **LMC** notation. Acceptance of the manufacturer's certificate for items of machinery for propulsion (including propulsion gearing with single input/output arrangements) and for electrical power generation and for other auxiliary machinery for essential services is subject to the following:

- The ship is a cargo ship of less than 500 gross tonnage or is a ship of 500 gross tonnage or greater and is not required to comply with international conventions applicable to a ship with unrestricted service.
- Propulsion power is provided by oil engines or gas turbines which have been type approved in accordance with LR requirements for marine application.
- Electrical power is provided by generators driven by oil engines or gas turbines which have been type approved in accordance with LR requirements for marine application.
- The design and manufacture standards for all machinery and associated engineering systems are the applicable LR Rules.
- The machinery and equipment is manufactured under a recognised quality control system.
- Propellers, propulsion shafting and multiple input/output gearboxes are not included within the scope of propulsion arrangements for acceptance of a manufacturer's certificate.

2.9.3 **Manufacturer's certificate** for assignment of the **MCH** notation. Acceptance of the manufacturer's certificate for propelling and essential auxiliary machinery is subject to the following:

- The ship is a cargo ship of less than 500 gross tonnage or is a ship of 500 gross tonnage or greater and is not required to comply with the international conventions applicable to a ship with unrestricted service.
- Propulsion power is provided by oil engines or gas turbines which have been type approved in accordance with LR requirements for marine application.
- Electrical power is provided by generators driven by oil engines or gas turbines which have been type approved in accordance with LR requirements for marine application.
- The power of any prime mover is less than 2,250 kW and the cylinder bore or any diesel engine is not greater than 300 mm.

- (e) The design and manufacture standards for machinery and associated systems are the applicable LR Rules or other marine standards acceptable to LR.
- (f) The machinery and equipment is manufactured under a recognised quality control system in accordance with the requirements of LR's *Rules for the Manufacture, Testing, and Certification of Materials*.
- (g) Individual components manufactured under Pt 1, Ch 2, 2.9 Application notes are to be delivered with a manufacturer's statement confirming that the scantlings comply with the applicable LR Rule requirements.

■ *Section 3*

Surveys - General

3.1 Statutory surveys

3.1.1 The Classification Committee will act, when authorised on behalf of Governments, in respect of National and International statutory safety and other requirements for passenger and cargo ships.

3.1.2 The Classification Committee will also act, when authorised, in respect of National Safety and other requirements relating to ships used for offshore mineral exploration and exploitation.

3.2 New construction surveys

3.2.1 When it is intended to build a ship for classification with LR, constructional plans and all necessary particulars relevant to the hull, equipment and machinery, as detailed in the Rules, are to be submitted for approval before the work is commenced. Proposals for any subsequent modifications or additions to the scantlings, arrangements or equipment shown on the approved plans are also to be submitted in writing and on plans for approval.

3.2.2 Where the proposed construction of any part of the hull or machinery is of novel design, or involves the use of unusual material, or where experience, in the opinion of the Classification Committee, has not sufficiently justified the principle or mode of application involved, special tests or examinations before and during service may be required. In such cases a suitable notation may be assigned.

3.2.3 The materials used in the construction of hulls and machinery intended for classification are to be of good quality and free from defects and are to be tested in accordance with the requirements of the Rules for Materials. The steel is to be manufactured by an approved process at an approved works. Alternatively, tests will be required to demonstrate the suitability of the steel.

3.2.4 New ships intended for classification are to be built under LR's Special Survey. From the commencement of the work until the completion of the ship, the Surveyors are to be satisfied that the materials, workmanship and arrangements are satisfactory and in accordance with the Rules. Any items found not to be in accordance with the Rules or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory, are to be rectified.

3.2.5 For compliance with Pt 1, Ch 2, 3.2 New construction surveys, LR is prepared to consider methods of survey and inspection for hull construction which formally include procedures involving the shipyard management, organisation and quality systems. The minimum requirements for the approval of any such proposed Quality Assurance methods are laid down in Pt 3, Ch 15 Quality Assurance Scheme for the Hull Construction of Ships.

3.2.6 Each offshore supply ship, offshore tug/supply ship, dredger, hopper dredger, sand carrier, hopper barge or reclamation craft, proceeding to sea is to comply with the draught and stability requirements of the National Authority and is to have on board sufficient stability data to enable it to be properly loaded and handled, or, where appropriate, to be properly towed. This data is to take full account of any intended special distribution or concentration of loading. In the case of an unmanned ship under tow, the data is to be made available to the tug master.

3.2.7 Copies of approved plans (showing the ship as built), essential certificates and records, required loading and other instruction manuals are to be readily available for use when required by the attending Surveyors, and may be required to be kept on board.

3.2.8 When the machinery is constructed under LR's Special Survey, this survey is to relate to the period from the commencement of the work until the final test under working conditions. Any items found not to be in accordance with the Rules or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory, are to be rectified.

3.2.9 When arrangements are such that essential machinery can be operated by remote and/or automatic control equipment, the control equipment is to be arranged, installed and tested in accordance with LR's Rules and Regulations.

3.2.10 The date of completion of the Special Survey during construction of ships built under LR's inspection will normally be taken as the date of build to be entered in the *LR Publication Record*. If the period between launching and commissioning is, for any reason, unduly prolonged, the dates of launching and completion or commissioning may be separately indicated in the *LR Publications*.

3.2.11 When a ship, upon completion, is not immediately commissioned but is laid-up for a period, the Classification Committee, upon application by the Owner, prior to the ship proceeding to sea, will direct an examination to be made by the Surveyors which may include a survey in dry-dock. If, as the result of such a survey, the hull and machinery be reported in all respects in accordance with applicable Rule requirements, the subsequent Special Survey and Complete Survey of the machinery will date from the time of such examination.

3.3 Existing ships

3.3.1 **Classification of ships not built under survey.** The requirements of the Classification Committee for the classification of ships which have not been built under LR's Survey are indicated in Pt 1, Ch 3, 19 Classification of ships not built under survey. Special consideration will be given to ships transferring class to LR from another recognised Classification Society.

3.3.2 **Reclassification.** When reclassification or class reinstatement is desired for a ship for which the class previously assigned by LR has been withdrawn or suspended, the Classification Committee will direct that a survey, appropriate to the age of the ship and the circumstances of the case, be carried out by the Surveyors. If, at such a survey, the ship be found or placed in a condition in accordance with the requirements of the Rules and Regulations, the Classification Committee will be prepared to consider reinstatement of the original class or the assignment of such other class as may be deemed necessary.

3.3.3 A similar arrangement will apply in the case of reclassification of refrigerated cargo installations.

3.3.4 The Classification Committee reserves the right to decline an application for classification or reclassification where the prior history or condition of the ship indicates this to be appropriate.

3.3.5 **Unscheduled surveys.** Where the Classification Committee has concern about the condition of a ship and/or the equipment an unscheduled survey may be required at any time to determine the actual condition.

3.4 Damages, repairs and alterations

3.4.1 All repairs to hull, equipment and machinery which may be required in order that a ship may retain her class (see Pt 1, Ch 2, 1.1 General), are to be carried out to the satisfaction of the Surveyors. When repairs are effected at a port, terminal or location where the services of a Surveyor to LR are not available, the repairs are to be surveyed by one of the Surveyors at the earliest opportunity thereafter.

3.4.2 When, at any survey, the Surveyors consider repairs to be immediately necessary, either as a result of damage, or wear and tear, they are to communicate their recommendations at once to the Owner, or his representative. When such recommendations are not complied with, immediate notification is to be given to the Classification Committee by the Surveyors.

3.4.3 Where repairs are to be carried out by a riding crew during a voyage then these must be planned in advance. A complete repair procedure, including the extent of proposed repair and the need for Surveyor's attendance during the voyage, is to be submitted reasonably in advance to the Surveyor for agreement. Failure to notify LR in advance of the repairs may result in the class of the ship being specially considered by the Classification Committee. Where emergency repairs are effected immediately due to an extreme emergency circumstance, the repairs should be documented in the ship's log and submitted thereafter to LR for use in determining further survey requirements.

3.4.4 When, at any survey, it is found that any damage, defect or breakdown (see Pt 1, Ch 2, 1.1 General) is of a nature that does not require immediate permanent repair, but is sufficiently serious to require rectification by a prescribed date in order to maintain class, a suitable condition of class is to be imposed by the Surveyors and recommended to the Classification Committee for consideration.

3.4.5 If a ship which is classed with LR is to leave harbour limits or protected waters under tow, the Owner is to advise LR of the circumstances prior to her departure.

3.4.6 If a ship which is classed with LR is taken in tow whilst at sea, the Owner is to advise LR of the circumstances at the first practicable opportunity.

3.4.7 Plans and particulars of any proposed alterations to the approved scantlings and arrangements of hull, equipment, or machinery are to be submitted for approval, and such alterations are to be carried out to the satisfaction of the Surveyors.

3.4.8 Where a complete replacement or addition of a major portion of the ship is involved, as defined in Pt 1, Ch 2, 3.4 Damages, repairs and alterations, consideration may be given to assignment of a separate date of build for the new structure. The Survey requirements shall be based on the date of build associated with each major portion of the ship. Special Survey due dates may be aligned at the discretion of the Committee.

3.4.9 A major portion of the ship may include a complete forward or after section, a complete main cargo section (which may include a complete hold/tank of a cargo ship), a complete block of deck structure of a passenger ship or a structural modification of a single hull to a double hull ship.

3.5 Existing ships – Periodical Surveys

3.5.1 Annual Surveys are to be held on all ships within three months, before or after each anniversary of the completion, commissioning or Special Survey in accordance with the requirements given in Pt 1, Ch 3 Periodical Survey Regulations. The date of the last Annual Survey will be recorded on the Class Direct website.

3.5.2 Intermediate Surveys are to be held on all ships instead of the second or third Annual Survey after completion, commissioning or Special Survey. The Intermediate Survey may be commenced at the second Annual Survey and progressed with completion at the third Annual Survey. The date of the last Intermediate Survey will be recorded on the Class Direct website. The concurrent crediting of items towards both Intermediate Survey and Special Survey is not permitted.

3.5.3 The Owner should notify LR whenever a ship can be examined in dry dock or on a slipway. A minimum of two Docking Surveys are to be held in each five-year Special Survey period and the maximum interval between successive Docking Surveys is not to exceed three years. One of the two Docking Surveys required in each five-year period is to coincide with the Special Survey. Consideration may be given in exceptional circumstances to an extension of the Docking Survey, not exceeding three months, provided the interval between successive surveys does not exceed 36 months. A definition of 'exceptional circumstances' is given in Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys. The Classification Committee may accept an In-water Survey in lieu of the intermediate docking between Special Surveys, see Pt 1, Ch 3, 4.3 In-water Surveys.

An In-water Survey shall not be permitted for ships of 15 years of age and over that are assigned the notation **ESP**. A Docking Survey is considered to coincide with the Special Survey when held within the 15 months prior to the due date of the Special Survey.

Where the Special Survey of the hull is carried out on a Continuous Survey basis, as given in Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys, the survey in dry dock may be held at any time within the five-year cycle.

3.5.4 The interval between dry-dockings for ships operating in fresh water and for certain non-self-propelled craft may be greater than that given in Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.

3.5.5 Attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ship is registered.

3.5.6 The date of the last examination in dry-dock or on a slipway will be recorded on the Class Direct website.

3.5.7 As an alternative to Annual Surveys and Docking Surveys, according to Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys and Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys respectively, ships classed '100A1 shipborne barge' may be subjected to Intermediate Surveys. These surveys become due 30 months after the previous Special Survey. The survey is to be in accordance with the requirements given in Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements, as applicable. Intermediate Surveys are to be completed within three months of the due date.

3.5.8 Survey requirements for In-water Surveys are given in Pt 1, Ch 3, 4.3 In-water Surveys. The date of the last In-water Survey will be recorded on the Class Direct website.

3.5.9 All ships classed with LR are also to be subjected to Special Surveys in accordance with the requirements given in Pt 1, Ch 3 Periodical Survey Regulations. These Surveys become due at five-yearly intervals, the first one five years from the date of build or date of Special Survey for Classification as recorded in the *Register Book*, and thereafter five years from the date recorded for the previous Special Survey. Consideration may be given at the discretion of the Committee to any exceptional circumstances justifying an extension of the hull classification to a maximum of three months beyond the fifth year. If an extension is agreed the next period of hull classification will start from the due date of the Special Survey before the extension was granted. In this context 'exceptional circumstances' means unavailability of dry-docking facilities, repair facilities, essential materials, equipment or spare parts or delays incurred by action taken to avoid severe weather conditions.

3.5.10 Where, on shipborne barges, Intermediate Surveys are permitted as an alternative to Annual and Docking Surveys, Special Surveys become due five years after the previous Special Survey.

3.5.11 Special Surveys may be commenced at the fourth Annual Survey after completion, commissioning, or previous Special Survey, and be progressed during the succeeding year with a view to completion by the due date of the Special Survey.

3.5.12 When Special Surveys are commenced prior to the fourth Annual Survey, the entire survey is to be completed within 15 months if such work is to be credited towards the Special Survey.

3.5.13 Ships which have satisfactorily passed a Special Survey will have a record entered in the *Register Book* indicating the date and the notation **ESP** if this is applicable see Pt 1, Ch 2, 2.3 Class notations (hull). Where the Special Survey is completed more than three months before the due date, the new record of Special Survey will be the final date of survey.

- (a) In all other cases, with the exception of Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys, the date recorded will be the fifth anniversary of the previous Special Survey.
- (b) For ships registered with Flag Administrations that have neither implemented the International Convention for the Safety of Life at Sea (SOLAS 1974) Harmonised System of Survey and Certification (HSSC) under the Protocol of 1988, nor adopted HSSC under IMO Resolution A.883 (21) – Global and Uniform Implementation of the Harmonised System of Survey and Certification, where the Special Survey is completed before the due date, the new record will be the final date of survey.

3.5.14 At the request of an Owner, it may be agreed that the Special Survey of the hull, for ships other than general dry cargo ships, bulk carriers, combination carriers, chemical tankers and oil tankers, be carried out on the Continuous Survey basis, all compartments of the hull being opened for survey and testing, in rotation, with an interval of five years between consecutive examinations of each part. In general, approximately one fifth of the Special Survey is to be completed each year and all the requirements of the particular hull Special Survey must be completed at the end of the five-year cycle. For examination of items listed in Pt 1, Ch 3, 2.2 Annual Surveys, Pt 1, Ch 3, 2.2 Annual Surveys and Pt 1, Ch 3, 3.2 Intermediate Surveys, Pt 1, Ch 3, 3.2 Intermediate Surveys and Pt 1, Ch 3, 3.2 Intermediate Surveys, the intervals for inspection will require to be specially agreed. For ships more than 10 years of age, an examination of the ballast tanks is to be carried out twice in each five year cycle, i.e. once within the scope of the Intermediate Survey and once within the scope of the Continuous Survey. Ships which have satisfactorily completed the cycle will have a record entered in the Class Direct indicating the date of completion which will not be later than five years from the last assigned date of Complete Survey of the hull. The agreement for surveys to be carried out on Continuous Survey basis may be withdrawn at the discretion of the Classification Committee.

3.5.15 In cases where the ship has been laid up or has been out of service for a considerable period because of a major repair or modification and the Owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the Special Survey. If the Owner elects to carry out the next due Special Survey, the period of class will start from the survey completion date.

3.5.16 Machinery is to be submitted to the surveys detailed in Pt 1, Ch 3, 11 Machinery surveys - General requirements to Pt 1, Ch 3, 17 Screwshafts, tube shafts and propellers.

3.5.17 Complete Surveys of machinery become due at five-yearly intervals, the first one five years from the date of build or date of first classification as recorded in Class Direct, and thereafter five years from the date recorded for the previous Complete Survey. Consideration can be given at the discretion of the Classification Committee to any exceptional circumstances justifying an extension of machinery class to a maximum of three months beyond the fifth year. If an extension is agreed, the next period of machinery class will start from the due date of Complete Survey of machinery before extension was granted. Surveys which are commenced prior to their due date are not to extend over a period greater than 15 months, except with the prior approval of the Classification Committee. Where the survey is completed more than three months before the due date, the recorded date of completion will be the final date of survey.

- (a) In all other cases, with the exception of Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys, the date recorded will be the fifth anniversary of the previous Complete Survey of machinery.
- (b) For ships registered with Flag Administrations that have neither implemented the International Convention for the Safety of Life at Sea (SOLAS 1974) Harmonised System of Survey and Certification (HSSC) under the Protocol of 1988, nor adopted HSSC under IMO Resolution A.883 (21) – Global and Uniform Implementation of the Harmonised System of Survey and Certification, where the Survey is completed before the due date, the new record will be the final date of survey.

3.5.18 Upon application by an Owner, the Classification Committee may agree to an extension of the survey requirements for main engines, which, by the nature of the ship's normal service, do not attain the number of running hours recommended by the engines' manufacturer for major overhauls within the survey periods given in Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.

3.5.19 If it is found desirable that any part of the machinery should be examined again before the due date of the next survey, a certificate for a limited period will be granted in accordance with the nature of the case.

3.5.20 When, at the request of an Owner, it has been agreed by the Classification Committee that the Complete Survey of the machinery may be carried out on the Continuous Survey basis, the various items of machinery are to be opened for survey in

rotation, as far as practicable, to ensure that the interval between consecutive examinations of each item will not exceed five years. In general, approximately one-fifth of the machinery is to be examined each year.

3.5.21 If any examination during Continuous Survey reveals defects, further parts are to be opened up and examined as considered necessary by the Surveyor, and the defects are to be made good to his satisfaction.

3.5.22 Upon application by an Owner, the Classification Committee may agree to an arrangement whereby, subject to certain conditions, some items of machinery may be examined by the Chief Engineer of the ship at ports where LR is not represented, or, where practicable, at sea, followed by a limited confirmatory survey carried out at the next port of call where an Exclusive Surveyor is available. Particulars of this arrangement may be obtained from LR. Where an approved planned maintenance scheme is in operation, the confirmatory surveys may be held at annual intervals, at which time the records will be checked and the operation of the scheme verified. Particulars of this arrangement may be obtained from any LR Office.

3.5.23 Where condition monitoring equipment is fitted, the Classification Committee, upon application by the Owner, will be prepared to amend applicable Periodical Survey requirements where details of the equipment are submitted and found satisfactory. Where machinery installations are accepted for this method of survey, it will be a requirement that an Annual Survey be held, at which time monitored records will be analysed and the machinery examined under working conditions. An acceptable lubricating oil trend analysis programme may be required as part of the condition monitoring procedures.

3.5.24 Boiler Surveys, examination of steam pipes and Screwshaft Surveys are to be carried out as stated in Pt 1, Ch 3, 15 Boilers to Pt 1, Ch 3, 17 Screwshafts, tube shafts and propellers.

3.5.25 Where any inert gas system is fitted for the protection of cargo tanks on board a ship intended for the carriage of oil or liquid chemicals in bulk, the system is to be surveyed annually in accordance with the requirements of Pt 1, Ch 3, 2.2 Annual Surveys. In addition, on ships to which an **IGS** notation has been assigned, a Special Survey of the inert gas plant is to be carried out at intervals not exceeding five years, in accordance with the requirements of Pt 1, Ch 3, 18 Inert gas systems.

3.5.26 Where the ship is fitted with a dynamic positioning system, the system is to be examined and tested annually in accordance with the requirements of Pt 1, Ch 3, 2.2 Annual Surveys. In addition, a Special Survey is to be carried out at intervals not exceeding five years in accordance with Pt 1, Ch 3, 11.2 Complete Surveys.

3.5.27 Where the ship is fitted with a classed refrigerated cargo installation, the installation is to be surveyed annually in accordance with the requirements of Pt 1, Ch 3, 20.1 Annual Surveys. In addition, a Special Survey is to be carried out at intervals not exceeding five years in accordance with the requirements of Pt 1, Ch 3, 20.2 Special Surveys. At the request of the Owner, consideration will be given to the Survey of the installation being carried out on the Continuous Survey basis.

3.5.28 Where the ship is fitted with a classed refrigerated cargo installation, a Loading Port Survey, as detailed in Pt 1, Ch 3, 20.4 Loading Port Surveys, may be carried out at the request of the Owner. On completion, a certificate will be issued recording, in addition to other details, the temperatures in the various refrigerated spaces at the time of the survey. The certificate issued by LR is not in respect of the cargo to be loaded or the manner in which it is to be stowed. A Loading Port Survey is not mandatory for classification, but may be carried out concurrently with the Annual, Continuous or Special Surveys if so desired.

3.5.29 At the request of an Owner, the Classification Committee may give special consideration to the application of the periodical survey requirements given in Pt 1, Ch 3 Periodical Survey Regulations to military ships or commercial ships owned or chartered by Governments, which are utilised in support of military operation or service.

3.5.30 Where the ship has been assigned an **OPS** notation, the on-shore power supply arrangements are to be examined annually in accordance with the requirements of Pt 1, Ch 3, 2.2 Annual Surveys. In addition, a Special Survey is to be carried out at intervals not exceeding five years in accordance with Pt 1, Ch 3, 14.2 Complete Surveys

3.5.31 Where the Committee has agreed to an Owner's request to assign the notation 'laid-up', the ship may be retained in class provided a satisfactory general examination of the hull and machinery is carried out at the Annual Survey due date and an Underwater Examination (UWE) is carried out at the Special Survey due date. The general examination may be carried out within three months before or after the Annual Survey due date.

3.6 Surveys for novel/complex systems, machinery and equipment

3.6.1 Where novel/complex systems, machinery and equipment have been accepted by LR and for which existing survey requirements are not considered to be suitable and sufficient then appropriate survey requirements are to be derived as part of the design approval process. In deriving these requirements LR will consider, but not be limited to, the following:

- (a) Plan appraisal submissions;
- (b) Risk Assessment documentation where required by the Rules;
- (c) Equipment manufacturer recommendations;

(d) Relevant recognised national or international standards.

3.7 Certificates

3.7.1 When the required reports, on completion of the survey of new or existing ships which have been submitted for classification, have been received from the Surveyors and classification has been agreed by the Classification Executive a Certificate of Classification may be issued by an authorised surveyor. After approval by the Classification Committee, a certificate of First Entry of Classification, signed by LR's Chairman or the Chairman of the Classification Committee, will be issued to Builders or Owners.

3.7.2 A Certificate of Class valid for five years subject to endorsement for Annual and Intermediate Surveys will also be issued to the Owners.

3.7.3 LR's Surveyors are permitted to issue provisional (interim) certificates to enable a ship classed with LR to proceed on her voyage (or to continue her service in the case of a fixed or tethered ship) provided that in their opinion it is in a fit and efficient condition. Such certificates will embody the Surveyors' recommendations for continuance of class, but in all cases are subject to confirmation by the Classification Committee.

3.7.4 The full class notation and abbreviated descriptive notes shall be stated on the Certificate of Class and the provisional (interim) certificate.

3.8 Notice of surveys

3.8.1 It is the responsibility of the Owners to ensure that all surveys necessary for the maintenance of class are carried out at the proper time and in accordance with the instructions of the Classification Committee. Information is available to Owners on the Class Direct website.

3.8.2 LR will make available to an Owner timely notice about forthcoming surveys by means of Quarterly Listing of Surveys, Conditions of Class and Memoranda. The omission of such notice, however, does not absolve the Owner from his responsibility to comply with LR's survey requirements for maintenance of class, all of which are available to Owners on the Class Direct website.

3.9 Withdrawal/Suspension of class

3.9.1 When the class of a ship, for which the Regulations as regards surveys on hull, equipment and machinery have been complied with, is withdrawn by the Classification Committee in consequence of a request from the Owner the notation 'Class withdrawn at Owner's request' (with date) will be assigned.

3.9.2 When the Regulations as regards surveys on hull, equipment or machinery have not been complied with and the ship is thereby not entitled to retain class, the class will be suspended or withdrawn, at the discretion of the Classification Committee, and a corresponding notation will be assigned.

3.9.3 Class will be automatically suspended and the Certificate of Class will become invalid if the Annual or Intermediate Survey is not completed within three months of the due date of the survey.

3.9.4 Class will be automatically suspended from the expiry date of the Certificate of Class in the event that the Special Survey has not been completed by the due date and an extension has not been agreed (see Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys), or is not under attendance by the Surveyors with a view to completion prior to resuming trading.

Classification will be reinstated from suspension of class upon satisfactory completion of the surveys due. The surveys to be carried out are to be based upon the survey requirements at the original date due and not on the age of the ship when the survey is carried out. Such surveys are to be credited from the date originally due. However, the ship's Class remains suspended from the date of suspension until the date Class is reinstated.

3.9.5 When, in accordance with Pt 1, Ch 2, 3.4 Damages, repairs and alterations of the Regulations, a condition of class is imposed, this will be assigned a due date for completion and the ship's class may be suspended if the condition of class is not dealt with, or postponed by agreement, by the due date.

3.9.6 When it is found, from the reported condition of the hull equipment machinery or arrangements of a ship, that an Owner has failed to comply with Pt 1, Ch 2, 1.1 General, Pt 1, Ch 2, 1.1 General, Pt 1, Ch 2, 3.4 Damages, repairs and alterations or Pt 1, Ch 2, 3.4 Damages, repairs and alterations, the class will be suspended or withdrawn, at the discretion of the Classification Committee, and a corresponding notation assigned. When it is considered that an Owner's failure to comply with these requirements is sufficiently serious, the suspension or withdrawal of class may be extended to include other ships controlled by the same Owner, at the discretion of the Classification Committee.

3.9.7 When the Classification Committee is satisfied that a ship proceeded to sea with less freeboard than that approved by the Classification Committee, or that the freeboard marks are placed higher on the sides of the ship than the position assigned or approved by the Classification Committee, or, in cases of ships where freeboards are not assigned, the draught is greater than that approved by the Classification Committee, the ship's class will be withdrawn or suspended in relation to the above voyage(s) concerned.

3.9.8 When the Classification Committee is satisfied that a specialised ship has been operated in a manner contrary to that agreed at the time of classification, or is being operated in environmental conditions which are more onerous or in areas other than those agreed by the Classification Committee, the ship's class will be withdrawn or suspended in relation to those operations.

3.9.9 Where a ship has been

- detained following a Flag State or Port State Control inspection on one or more occasions with serious deficiencies found, or
- been subject to an unscheduled survey (see Pt 1, Ch 2, 3.3 Existing ships) with serious deficiencies found,

then class will be liable to be suspended or withdrawn, at the discretion of the Classification Committee, and a corresponding notation will be assigned. In these cases, a period of notice, but not exceeding 3 months, may be given prior to any suspension or withdrawal of class.

3.9.10 When a client fails to pay all undisputed portions of invoices for the services by the contractual due date then class will be liable to be suspended or withdrawn at the discretion of the Classification Committee and a corresponding notation will be assigned. In these cases, a period of notice not exceeding 3 months may be given, prior to any suspension or withdrawal of class.

3.9.11 In all instances of class withdrawal or suspension, the assigned notation, with date of application, will be published by members of the LR Group. In cases where class has been suspended by the Classification Committee and it becomes apparent that the Owners are no longer interested in retaining LR's class it will be withdrawn.

3.9.12 When a ship is intended for a demolition voyage with any Periodical Survey overdue, the ship's class suspension may be held in abeyance and consideration may be given to allow the ship to proceed on a single direct ballast voyage from the lay up or final discharge port to the demolition yard, provided the attending Surveyor finds the ship in a satisfactory condition to proceed for the intended voyage, at the discretion of the Classification Committee.

3.9.13 When a ship is intended for a single voyage from 'laid-up' position to repair yard with any Periodical Survey overdue, the ship's class suspension may be held in abeyance and consideration may be given to allow the ship to proceed on a single direct ballast voyage from the site of lay up to the repair yard, upon agreement with the Flag Administration, at the discretion of the Classification Committee. This is provided the ship is found in a satisfactory condition by surveys, the extent of which are to be based on surveys overdue and duration of lay-up.

3.9.14 For reclassification and reinstatement of class, see Pt 1, Ch 2, 3.3 Existing ships and Pt 1, Ch 2, 3.9 Withdrawal/ Suspension of class.

3.10 Appeal from Surveyors' recommendations

3.10.1 If the recommendations of the Surveyors are considered in any case to be unnecessary or unreasonable, an appeal may be made to the Classification Committee, who may direct a Special Examination to be held.

3.11 Force majeure

3.11.1 If due to circumstances reasonably beyond the Owner's or LR's control, as defined below, the ship is not in a port when surveys become overdue the Classification Committee may allow the ship to sail, in class, directly to an agreed discharge port and then, if necessary, in ballast to an agreed repair facility at which the survey can be completed. In this context, 'Force Majeure' means damage to the ship, unforeseen inability of Surveyors to attend the ship due to governmental restrictions on right of access or movement of personnel, unforeseen delays in port or inability to discharge cargo due to unusually lengthy periods of severe weather, strikes, civil strife, acts of war or other force majeure.

3.12 Ownership details

3.12.1 It is the responsibility of the Owner to inform a member of the LR Group in writing of any change to its contact details and in the event of a ship sale to supply details of the new Owners. If the new Owner of a ship cannot be properly identified and the contact details established then the class of that ship will be specially considered by the Classification Committee. It is the responsibility of the new Owner to inform a member of the LR Group in writing of their contact details and that they are now responsible for the ship, if they fail to do so then the class of that ship will be specifically considered by the Classification Committee.

■ *Section 4* **IACS and EMSA Audits and Assessments**

4.1 Audit of surveys

4.1.1 The surveys required by the Regulations may be subject to audit or assessment in accordance with the requirements of the International Association of Classification Societies and European Maritime Safety Agency requirements.

■ *Section 5* **Type Approval/Type Testing/Quality Control System**

5.1 LR Type Approval — Marine Applications

5.1.1 LR Type Approval is an impartial certification system that provides independent third-party Type Approval Certificates attesting to a product's conformity with specific standards or specifications. It is based on design review and type testing or where testing is not appropriate, a design analysis.

5.1.2 The LR Type Approval System is a process whereby a product is assessed in accordance with a specification, standard or code to check that it meets the stated requirements and through selective testing demonstrates compliance with specific performance requirements. The testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under approval. Thereafter, the producer is required to use Quality Control procedures and processes to ensure that each item delivered is in conformity with that which has been Type Approved.

5.1.3 The selective testing required by Pt 1, Ch 2, 5.1 LR Type Approval — Marine Applications is to include environmental testing applicable to the product's installation on board a ship classed or intended to be classed with LR.

5.1.4 LR Type Approval does not remove the requirements for inspection and survey procedures required by the Rules for equipment to be installed in ships classed or intended to be classed with LR. Also, LR Type Approval does not remove the requirement for plan appraisal of a system that incorporates Type Approved equipment where required by the Rules.

5.1.5 LR Type Approval is subject to the understanding that the producer's recommendations and instructions for the product and any relevant requirements of the Rules for the Classification of Ships are fulfilled.

5.1.6 The producer supplying equipment or components under Quality Control procedures and processes is to have a recognized quality management system certified by an IACS member or Notified Body. The Quality Control procedures and processes are to address the production of the product consistent with Pt 1, Ch 2, 5.3 Quality Control System.

5.1.7 Where equipment or components have been Type Approved in accordance with specifications and procedures other than LR's, details of the product, certification and testing are to be submitted for consideration where appropriate.

5.2 Type testing

5.2.1 Type testing is an impartial process that provides independent third-party verification that an item of machinery or equipment has satisfactorily undergone a functional type test.

5.2.2 Type testing is carried out against defined performance and test standards for a defined period of time with test conditions varying between minimum and maximum declared design conditions.

5.2.3 Type testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under assessment.

5.2.4 After type testing, mechanical equipment is to be opened out and inspected for damage or excessive wear.

5.2.5 On application from the manufacturer, type tests may be waived for equipment and machinery that has been proven to be reliable in marine service and where compliance with the current applicable standards can be demonstrated. Equipment and machinery that has been previously type tested with satisfactory testing evidence and certification need not have the type tests repeated where previous testing is in accordance with current testing standards.

5.2.6 The acceptance of type testing certification is subject to the understanding that the manufacturer's recommendations and instructions for the product and any relevant requirements of the applicable Rules are fulfilled.

5.3 Quality Control System

5.3.1 A quality control system for the purposes of LR acceptance of materials and machinery refers to a scheme that covers the operational techniques and activities that is used to demonstrate that the quality requirements for a product are in accordance with declared standards.

5.3.2 The quality control system for a particular product extends to all parties involved in the supply chain from manufacture and testing through to delivery of the product.

5.3.3 LR acceptance of machinery and equipment manufactured under a quality control scheme is dependent on the scheme being maintained through a traceable process involving planned audits and spot inspections at the discretion of LR Surveyors. The purpose of the audits and spot inspections is to ensure that the procedures for manufacture and quality control are being maintained in a satisfactory manner.

5.3.4 The use of a quality control system does not remove the requirements for inspection processes that may be required by the Rules applicable to the equipment being supplied with a manufacturer's certificate. Also the use of a quality control system does not remove the requirement for plan appraisal of equipment or systems where required by the Rules.

■ *Section 6*
Classification of machinery with [✕] LMC or MCH notation

6.1 General

6.1.1 After delivery of machinery and equipment with the manufacturer's certificate to the shipyard, Survey at the Shipyard and Periodical Surveys are to be in accordance with the requirements for ships built or accepted into class with the ✕ **LMC** notation.

6.2 Appraisal and records

6.2.1 To facilitate survey and compilation of classification records, plans and information required for a ship being accepted into class with the ✕ **LMC** notation are to be submitted for appraisal and information. Plans are not required where machinery and equipment has previously been type approved; in these cases it is only necessary to submit details of the machinery and equipment together with details of previous approval.

6.3 Survey and inspection

6.3.1 The manufacturer's certificate for acceptance of machinery and equipment for assignment of the [✕] **LMC** or **MCH** notation is to be in the English language and include the following information:

- (a) Design and manufacturing standard(s) used.
- (b) Materials used for construction of key components and their sources.
- (c) Details of the quality control system applied during design, manufacture and testing and of any software maintenance.
- (d) Details of any type approval or type testing.
- (e) Details of installation and testing recommendations for the machinery or equipment.

The manufacturer is to have a recognized quality management system certified by an IACS member or a Notified Body.

6.3.2 The installation and testing of machinery and equipment at the build yard which has been supplied with a manufacturer's certificate is to be in accordance with the requirements applicable to a ship having the ✕ **LMC** notation.

■ Section 1 General

1.1 Frequency of surveys

1.1.1 The requirements of this Chapter are applicable to the Periodical Surveys set out in Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys. Except as amended at the discretion of the Committee, the periods between such surveys are as follows:

- (a) Annual Surveys, as required by Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.
- (b) Intermediate Surveys, as required by Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.
- (c) Docking Surveys, as required by Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys and Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.
- (d) When ships classed **100A1 shipborne barge** are subjected to Intermediate Surveys, those surveys become due 30 months after the previous Special Survey, see Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.

Periodical Survey Regulations

Part 1, Chapter 3

Section 1

- (e) Special Surveys at five-yearly intervals, see Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys. For alternative arrangements, see *also* Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys, Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys, Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys and Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.
- (f) Complete Surveys of machinery at five-yearly intervals, see Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.

1.1.2 For ships assigned the notation 'laid-up', in order to maintain the ship in class a general examination of the hull and machinery is to be carried out in lieu of the Annual Survey and an Underwater Examination (UWE) is to be carried out in lieu of the Special Survey, see Pt 1, Ch 3, 2.1 General, Pt 1, Ch 3, 5.1 General and Pt 1, Ch 3, 11.1 Annual, Intermediate and Docking Surveys.

1.1.3 When it has been agreed that the complete survey of the hull and machinery may be carried out on the Continuous Survey basis, all compartments of the hull and all items of machinery are to be opened for survey in rotation to ensure that the interval between consecutive examinations of each part will not exceed five years, see Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys and Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys.

1.1.4 For the frequency of surveys of boilers, steam pipes, screwshafts, tube shafts, propellers and inert gas systems, see Pt 1, Ch 3, 15 Boilers to Pt 1, Ch 3, 18 Inert gas systems.

1.1.5 For the requirements for surveys of refrigerated cargo installations, see Pt 6, Ch 3 Refrigerated Cargo Installations.

1.1.6 In general, the periodical survey requirements contained in Pt 1, Ch 3 Periodical Survey Regulations also apply to ships built in accordance with the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR)*. Where a requirement does not apply to CSR ships, or where a specific requirement applies only to CSR ships, this will be clearly stated.

1.2 Surveys for damage or alterations

1.2.1 At any time when a ship is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult to access are to be specially examined, e.g. if any part of the main or auxiliary machinery, including boilers, insulation or fittings, is removed for any reason, the steel structure in way is to be carefully examined by the Surveyor, or when cement in the bottom or covering on decks is removed, the plating in way is to be examined before the cement or covering is relaid.

1.3 Unscheduled surveys

1.3.1 In the event that Lloyd's Register (hereinafter referred to as LR) has cause to believe that its Rules and Regulations are not being complied with, LR reserves the right to perform unscheduled surveys of the hull and machinery as well as the applicable statutory requirements whether or not the appropriate statutory certificate has been issued by LR.

1.3.2 In the event of significant damage or defect affecting any ship, LR reserves the right to perform unscheduled surveys of the hull or machinery of other similar ships classed by LR and deemed to be vulnerable.

1.4 Surveys for the issue of Convention certificates

1.4.1 Surveys are to be held by LR when so appointed, or by the Exclusive Surveyors to a National Administration or by an IACS Member when so authorised by the National Authority, or, in the case of Cargo Ship Safety Radio Certificates or Safety Management Certificates, by any organisation authorised by the National Authority. In the case of dual classed ships, Convention Certificates may be issued by the other Society with which the ship is classed provided this is recognised in a formal Dual Class Agreement with LR and provided the other Society is also authorised by the National Authority.

1.5 Definitions

1.5.1 An **Oil Tanker** is a sea going self-propelled ship which is constructed generally with integral tanks and is intended primarily to carry oil in bulk and includes ship types such as combination carriers (ore/oil and ore/bulk/oil ships, etc.). Where referred to in this Chapter, it shall also include double hull oil tankers as well as tankers with alternative structural arrangements, e.g. mid-deck designs, except where specified. Single hull oil tankers and combination carriers are not covered by the IACS Common Structural Rules (CSR).

1.5.2 A **Double Hull Oil Tanker** is a sea going self-propelled ship which is constructed primarily for the carriage of oil in bulk, where the cargo tanks are protected by a double hull extending for the entire length of the cargo area, consisting of double side and double bottom spaces for the carriage of salt-water ballast.

1.5.3 A **Bulk Carrier** is a sea going self-propelled ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks and with single side skin construction in the cargo length area, and is intended primarily to

Periodical Survey Regulations

Part 1, Chapter 3

Section 1

carry dry cargo in bulk and includes ship types such as ore carriers. Where referred to in this Chapter, it shall also include double skin bulk carriers except where specified.

1.5.4 A **Double Skin Bulk Carrier** is a sea going self-propelled ship which is constructed generally with single deck, double bottom, topside tanks and hopper side tanks and with double side skin construction in the cargo length area (regardless of the width of the wing space) and is intended primarily to carry dry cargo in bulk and includes such types as ore carriers.

1.5.5 An **Ore Carrier** is a sea going self-propelled ship which is constructed generally with single deck, two longitudinal bulkheads and a double bottom throughout the cargo length area and intended primarily to carry ore cargoes in the centre holds only. Ore carriers are not covered by the IACS Common Structural Rules (CSR).

1.5.6 A **Chemical Tanker** is a sea going self-propelled ship constructed generally with integral tanks and being single or double hull construction, or having alternative structural arrangements, used primarily for the carriage in bulk of any liquid product listed in Chapter 17 of the *International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk, IBC Code*.

1.5.7 A **Gas Carrier** is a cargo ship constructed or adapted and used for the carriage in bulk of any liquefied gas or other products of flammable nature listed in Ch 19 Summary of Minimum Requirements of the *International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk*.

1.5.8 A **Ballast Tank** is a tank which is used solely for the carriage of salt-water ballast. For bulk carriers, a space which is used for both cargo and salt-water ballast will be treated as a salt-water ballast tank when substantial corrosion has been found in that space. For double skin bulk carriers, the double side tank is to be considered as a separate tank even if it is connected to either the topside or hopper side tank. For oil tankers and chemical tankers, a combined tank which is used for both cargo and salt-water ballast as a routine part of the ship's operation will be treated as a ballast tank. A cargo tank which in exceptional cases may carry salt-water ballast during severe weather conditions and is not designated as a combined cargo/ballast tank will be treated as a cargo tank.

1.5.9 **Spaces** are separate compartments such as holds, tanks, cofferdams and void spaces bounding cargo holds, decks and the outer hull.

1.5.10 **Enclosed space.** An enclosed space is any place of an enclosed nature where there is a risk of death or serious injury from hazardous substances or dangerous conditions. Examples include, but are not limited to: boilers, pressure vessels, cargo spaces (cargo holds or cargo tanks), cargo space stairways, ballast tanks, double bottoms, double hull spaces, fuel oil tanks, lube oil tanks, sewage-tanks, pump-rooms, compressor rooms, cofferdams, void spaces, duct keels, inter-barrier spaces, engine crankcases, excavations and pits.

1.5.11 An **Overall Survey** is a survey intended to report on the overall condition of the hull structure and to determine the extent of additional Close-up Surveys.

1.5.12 A **Close-up Survey** is a survey where the details of structural components are within the close visual inspection range of the Surveyor, i.e. normally within reach of hand.

1.5.13 A **Transverse Section** includes all longitudinal members such as plating, longitudinals and girders at the deck, side, bottom, inner bottom, inner side, hopper side, top wing side and longitudinal bulkhead, where fitted. For transversely framed ships, a transverse section includes adjacent frames and their end connections in way of transverse sections.

1.5.14 **Representative Spaces** are those which are expected to reflect the condition of other spaces of similar type and service and with similar corrosion prevention systems. When selecting representative spaces, account is to be taken of the service and repair history on board and identifiable Critical Structural Areas.

1.5.15 **Critical Structural Areas** are locations which have been identified from calculations to require monitoring or from the service history of the subject ship or from similar ships or sister ships, if applicable, to be sensitive to cracking, buckling or corrosion which would impair the structural integrity of the ship.

1.5.16 **Substantial Corrosion** is wastage of individual plates and stiffeners in excess of 75 per cent of allowable margins, but within acceptable limits. For ships built in accordance with the IACS Common Structural Rules (CSR), substantial corrosion is an extent of corrosion such that the assessment of the corrosion pattern indicates a gauged (or measured) thickness between $t_{ren} + 0,5 \text{ mm}$ and t_{ren} . Renewal thickness, t_{ren} , is the minimum allowable thickness, in mm, below which renewal of the structural members is to be carried out.

1.5.17 Steel renewal requirements have been separately determined according to date of contract for construction for:

(a) cargo hold hatch covers and coamings under IACS UR S21 and UR S21A; and

Periodical Survey Regulations

Part 1, Chapter 3

Section 1

- (b) bulk carriers' corrugated transverse watertight cargo hold bulkheads under IACS UR S18. See Pt 1, Ch 3, 5.6 Thickness measurement, Pt 1, Ch 3, 6.7 Thickness measurement and Pt 1, Ch 3, 7.7 Thickness measurement.

In these cases, the net thickness, t_{net} , is the minimum net thickness of the structural member, excluding any corrosion addition, and is defined in Pt 4, Ch 7, 12.1 General for Hatch Covers and Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions for Transverse Bulkheads.

1.5.18 **A Corrosion Prevention System** is normally considered a full hard protective coating. This is usually to be an epoxy coating or equivalent. Other systems with the exception of soft and semi-hard coatings, may be considered acceptable as alternatives provided they are applied and properly maintained in compliance with the manufacturer's specification.

1.5.19 For the application of requirements outlined in Sections Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements, Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements, Pt 1, Ch 3, 4 Docking Surveys and In-water Surveys - Hull and machinery requirements and Pt 1, Ch 3, 5 Special Survey - General - Hull requirements, a general dry cargo ship is a self-propelled ship of 500 gross tonnes or above, constructed generally with a 'tween deck and intended to carry solid cargoes, other than:

- bulk carriers;
- ships dedicated to the carriage of containers;
- roll on-roll off ships;
- refrigerated cargo ships;
- dedicated wood chip carriers;
- dedicated cement carriers;
- livestock carriers;
- dock/deck cargo ships;
- general dry cargo ships of double side-skin construction, with double side-skin extending for the entire length of the cargo area, and for the entire height of the cargo hold to the upper deck.

1.5.20 **Coating Condition** is defined as follows:

GOOD: Condition with only minor spot rusting.

FAIR: Condition with local breakdown of coating at edges of stiffeners and weld connections and/or light rusting over 20 per cent or more of areas under consideration, but less than as defined for POOR condition.

POOR: Condition with general breakdown of coating over 20 per cent or more of areas or hard scale at 10 per cent or more of areas under consideration.

These are further clarified as follows, in order to achieve a unified assessment of coating conditions, see Table 3.1.1 Assessment of coating conditions:

GOOD: Condition with spot rusting on less than 3 per cent of the area under consideration without visible failure of the coating. Rusting at edges or welds should be on less than 20 per cent of edges or weld lines in the area under consideration.

FAIR: Condition with breakdown of coating or rust penetration on less than 20 per cent of the area under consideration. Hard rust scale should be less than 10 per cent of the area under consideration. Rusting at edges or welds should be on less than 50 per cent of edges or weld lines in the area under consideration.

POOR: Condition with breakdown of coating or rust penetration on more than 20 per cent or hard rust scale on more than 10 per cent of the area under consideration or local breakdown concentrated at edges or welds on more than 50 per cent of edges or weld lines in the area under consideration.

Further information on coating assessment can be found in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

Table 3.1.1: Assessment of coating conditions

	GOOD ⁽³⁾	FAIR	POOR
Breakdown of coating or area rusted ⁽¹⁾	< 3%	3–20%	> 20%
Area of hard rust scale ⁽¹⁾	—	10%	≥ 10%

Periodical Survey Regulations

Part 1, Chapter 3

Section 1

Local breakdown of coating or rust on edges or weld lines ⁽²⁾	< 20%	20–50%	> 50%
<p>Note 1. % is the percentage calculated on basis of the area under consideration or of the 'critical structural area'.</p> <p>Note 2. % is the percentage calculated on basis of edges or weld lines in the area under consideration or of the 'critical structural area'.</p> <p>Note 3. Spot rusting, i.e. rusting in spot without visible failure of coating.</p>			

1.5.21 **Pitting Corrosion.** Pitting corrosion is defined as scattered corrosion spots/areas with local material reductions which are greater than the general corrosion in the surrounding area. Further information on pitting intensity can be found in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

1.5.22 **Edge Corrosion.** Edge corrosion is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings. An example of edge corrosion can be found in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

1.5.23 **Grooving Corrosion.** Grooving corrosion is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffener or plate butts or seams. An example of groove corrosion can be found in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

1.5.24 A **Prompt and Thorough Repair** is a permanent repair completed at the time of survey to the satisfaction of the Surveyor, therein removing the need for the imposition of any associated condition of class or recommendation.

1.5.25 Bulk carriers with hybrid cargo hold arrangements are to have single skin cargo holds surveyed in accordance with the requirements for single skin bulk carriers and the double skin cargo holds surveyed in accordance with the requirements for double skin bulk carriers.

1.5.26 **Special consideration** or **specially considered** (in connection with close-up surveys and thickness measurements) means sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.

1.5.27 **Air pipe heads** installed on the exposed decks are those extending above the freeboard deck or superstructure decks.

1.5.28 The **Cargo Area** or **Cargo Length Area** is that part of the ship which contains all cargo holds and adjacent areas including fuel tanks, cofferdams, ballast tanks and void spaces. For oil tankers and chemical tankers, the **Cargo Area** is that part of the ship which contains cargo tanks, slop tanks and cargo/ballast pump-rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.

1.5.29 A **Natural gas fuel installation** comprises the following; fuel bunkering, fuel storage, fuel processing and fuel delivery to gas fuelled consumers. The scope of the natural gas fuel installation extends from the bunker manifold to the natural gas fuelled consumer and includes any re-liquefaction plant and compressors that are fitted to manage boil off. These installations may be on board any ship type referred to in this Chapter except gas carriers as defined in Pt 1, Ch 3, 1.5 Definitions.

1.6 Preparation for survey and means of access

1.6.1 In order to enable the attending Surveyor(s) to carry out surveys, provisions for safe access and for surveys are to be agreed between the Owner and LR. Attention is drawn to the applicable recommendations in the IACS PR37 and/or IMO Recommendations For Entering Enclosed Spaces Aboard Ships, Resolution A.1050(27).

1.6.2 Means are to be provided to enable the Surveyor to examine the structure in a safe and practical way. Where the provisions of safety and required access are determined by the Surveyor not to be adequate, then the survey of the space(s) involved is not to proceed.

1.6.3 Spaces are to be made safe for access and survey and are to be sufficiently cleaned, illuminated and ventilated.

1.6.4 In preparation for survey, thickness measurements and to allow for a thorough examination, cleaning is to include removal from surfaces of all loose accumulated corrosion scale. Spaces are to be sufficiently clean and free from water, scale, dirt, and oil residues, etc. to reveal corrosion, deformation, fractures, damages or other structural deterioration, as well as the condition of the protective coating. However, those areas of structure whose renewal has already been decided by the Owner need only be cleaned and descaled to the extent necessary to determine the limits of renewed areas.

1.6.5 Where soft or semi-hard coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft or semi-hard coating is to be removed.

1.6.6 Prior to entering an enclosed space, it is to be verified by a competent person using a calibrated multi gas meter that the atmosphere in that space is free from hazardous gas and contains sufficient oxygen.

1.6.7 Emergency equipment and personnel are to be available in case of an emergency or rescue operation.

1.6.8 Information on procedures, equipment-operating instructions and safety checklists is to be available.

1.6.9 During the survey, ventilation is to be ensured and periodic testing is to be carried out as necessary to verify that the atmosphere remains safe for access.

1.6.10 For surveys, including close-up survey where applicable, in cargo spaces and ballast tanks, one or more of the following means of access is to be provided:

- (a) Permanent staging and passages through structures.
- (b) Temporary staging and passages through structures.
- (c) Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms.
- (d) Portable ladders, see Note.
- (e) Boats or rafts.
- (f) Other equivalent means.

Note Portable ladders may be used, at the discretion of the Surveyor, for survey of the hull structure of single skin bulk carriers, except for the close-up survey of cargo hold shell frames, see Pt 1, Ch 3, 1.6 Preparation for survey and means of access and Pt 1, Ch 3, 1.6 Preparation for survey and means of access

1.6.11 For close-up surveys of the cargo hold shell frames of single skin bulk carriers with a deadweight less than 100,000 tonnes, one or more of the following means of access is to be provided:

- (a) Permanent staging and passages through structures.
- (b) Temporary staging and passages through structures.
- (c) Portable ladder restricted to not more than 5 m in length may be accepted for surveys of the lower section of a shell frame including bracket.
- (d) Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms.
- (e) Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water.
- (f) Other equivalent means.

1.6.12 For close-up surveys of the cargo hold shell frames of single skin bulk carriers with a deadweight equal to or greater than 100,000 tonnes, the use of portable ladders is not accepted and one or more of the following means of access is to be provided:

- (a) At Annual Surveys, Intermediate Surveys held before the ship is 10 years old and Special Survey I:
 - (i) Permanent staging and passages through structures.
 - (ii) Temporary staging and passages through structures.
 - (iii) Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms.
 - (iv) Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water.
 - (v) Other equivalent means.
- (b) At Special Survey II and all subsequent Intermediate Surveys and Special surveys:
 - (i) Either permanent or temporary staging and passage through structures for close-up survey of at least the upper part of hold frames.
 - (ii) Hydraulic arm vehicles such as conventional cherry pickers for surveys of lower and middle part of shell frames as alternative to staging.
 - (iii) Lifts and movable platforms.
 - (iv) Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water.
 - (v) Other equivalent means.
- (c) Notwithstanding the above requirements, for single skin bulk carriers greater than 10 years old, at Annual Survey the use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable for when the close-up survey of cargo hold shell frames is required.

Periodical Survey Regulations

Part 1, Chapter 3

Section 1

1.6.13 Survey at sea or anchorage may be undertaken when the Surveyor is fully satisfied with the necessary assistance from the personnel onboard and provided the foregoing preparations for survey, as applicable, have been met. In addition, the following conditions and limitations are to be applied:

- (a) A communication system is to be arranged between the survey party in the tank and the responsible officer on deck. This system must include the personnel in charge of ballast pump handling if boats or rafts are to be used.
- (b) Surveys of tanks by means of boats or rafts are to be agreed with the attending Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response under foreseeable sea conditions and provide the expected rise of water within the tank does not exceed 0,25 m.

Where it has been agreed to use boats or rafts when carrying out close-up survey, the following conditions are to be observed:

- (i) Only rough duty, inflatable rafts or boats, having satisfactory residual buoyancy and stability even if one chamber is ruptured, are to be used.
 - (ii) The boat or raft is to be tethered to the access ladder and an additional person is to be stationed down the access ladder with a clear view of the boat or raft.
 - (iii) Appropriate lifejackets are to be available for all participants.
 - (iv) The surface of water in the tank is to be calm and the water level stationary. On no account is the level of the water to be rising while the boat or raft is in use.
 - (v) The tank or space must contain clean ballast water only. Even a thin sheen of oil on the water is not acceptable.
 - (vi) At no time is the water level to be allowed to be within 1 m of the deepest under deck web face flat so that the survey team is not isolated from a direct escape route to the tank hatch. Filling to levels above the deck transverses is only to be contemplated if a deck access manhole is fitted and open in the bay being examined, so that an escape route for the survey party is available at all times. Other effective means of escape to the deck may be considered.
 - (vii) If the tanks (or spaces) are connected by a common venting system, or Inert Gas system, the tank in which the boat or raft is to be used is to be isolated to prevent a transfer of gas from other tanks (or spaces).
- (c) Rafts or boats may be permitted for the survey of the under deck areas of tanks or spaces, if the depth of the under deck web plating is 1,5 m or less. If the depth of the under deck web plating is greater than 1,5 m, then rafts or boats may be permitted only when the coating of the under deck structure is in GOOD condition and there is no evidence of wastage or if a permanent means of access is provided in each bay to allow safe entry and exit. A permanent means of access is considered to mean:
- (i) Access direct from the deck via a vertical ladder and a small platform fitted approximately 2 m below the deck in each bay or,
 - (ii) Access to deck from a longitudinal permanent platform having ladders to the deck at each end of the tank. The platform shall be arranged over the full length of the tank and level with, or above, the maximum water level needed for rafting of the under deck structure. For this purpose, the ullage corresponding to the maximum water level is to be assumed not more than 3 m from the deck plate measured at the midspan of deck transverses and at the mid point of the tank's length.

If neither of the above conditions are met, then staging or another equivalent means is to be provided for the survey of the under deck areas.

1.6.14 Rescue and emergency response equipment: if breathing apparatus and/or other equipment is used as 'rescue and emergency response equipment', it is recommended that the equipment be suitable for the configuration of the space being surveyed.

1.6.15 For ships assigned the notation **ESP**, the Owner is to respond to a Survey Planning Questionnaire and to prepare a Survey Programme, see Pt 1, Ch 3, 6.3 Planning for survey, Pt 1, Ch 3, 7.3 Planning for survey and Pt 1, Ch 3, 8.3 Planning for survey. In such cases, the following requirements are applicable:

- (a) The Survey Planning Questionnaire is to be submitted to LR prior to the preparation of a Survey Programme. The response to the Questionnaire is to include information on access provisions for close-up Surveys and thickness measurements; cargo history; the results of inspections carried out by the Owner; a list of reports of Port State Control Inspection containing hull structural deficiencies; a list of Safety Management System non-conformities related to hull maintenance and details of the thickness measurement company.
- (b) The Survey Programme is to be submitted prior to the commencement of any part of the Intermediate Survey on ships over 10 years of age and Special Survey. This is to be in a written format and submitted to LR at least six months in advance of the survey. The Survey Programme at Intermediate Survey may consist of the Survey Programme agreed for the previous

Special Survey supplemented by the Executive Hull Summary of that Special Survey and later relevant survey reports. The survey will not commence until a Survey Programme has been agreed.

- (c) The Survey Programme is to be worked out taking into account any amendments to the survey requirements implemented after the previous Special Survey.
- (d) Further information on the Survey Planning Questionnaire and Survey Programme can be found in the *ESP guidance booklets* that have been prepared by LR and are available on the Class Direct website.
- (e) Prior to the commencement of any part of the Intermediate Survey and Special Survey, a survey planning meeting is to be held between the attending Surveyor(s), the Owner's representative in attendance, the thickness measurement company operator representative (as applicable) and the Master of the ship or an appropriately qualified representative appointed by the Master or Owner for the purpose of ascertaining that all the arrangements envisaged in the Survey Programme are in place, so as to ensure the safe and efficient conduct of the survey to be carried out. The following is an indicative list of items that are to be addressed in the meeting:
 - (i) Schedule of the ship (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.).
 - (ii) Provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety).
 - (iii) Extent of the thickness measurements.
 - (iv) Permissible diminution levels.
 - (v) Extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion.
 - (vi) Execution of thickness measurements.
 - (vii) Taking representative readings in general and where uneven corrosion/pitting is found.
 - (viii) Mapping of areas of substantial corrosion.
 - (ix) Communication between attending surveyor(s), the thickness measurement company operator(s) and Owner's representative(s) concerning findings.
- (f) Proper preparation and close co-operation between the attending Surveyor(s) and the Owner's representative on board prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

1.6.16 For **natural gas fuel installations** see also Pt 1, Ch 3, 23.1 General .

1.7 Thickness measurement at surveys

1.7.1 This Section is applicable to the thickness measurement of the hull structure where required by Sections Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements, Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements, Pt 1, Ch 3, 5 Special Survey - General - Hull requirements, Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements and Pt 1, Ch 3, 9 Ships for liquefied gases.

1.7.2 Prior to the commencement of the Intermediate Survey and Special Survey, a meeting is to be held between the attending Surveyor(s), the Owner's representative in attendance, the thickness measurement company representative and the Master of the ship or an appropriately qualified representative appointed by the Master or Owner, so as to ensure the safe and efficient conduct of the survey and thickness measurements to be carried out.

1.7.3 Thickness measurements are normally to be taken by means of ultrasonic test equipment and are to be carried out by a firm approved in accordance with LR's *Approval for Thickness Measurement of Hull Structure*. For non-**ESP** ships less than 500 gross tons and all fishing vessels, a suitably qualified exclusive Surveyor (where available) may carry out thickness measurements. On all other occasions, an approved firm is to carry out the thickness measurements.

1.7.4 The Surveyor may require to measure the thickness of the material in any portion of the structure where signs of wastage are evident or wastage is normally found. Any parts of the structure which are found defective or excessively reduced in scantlings are to be made good by materials of the approved scantlings and quality. Attention is to be given to the structure in way of discontinuities. If a corrosion control **CC** special features notation, as defined in the *Register Book*, is assigned, then surfaces are to be re-coated as necessary.

1.7.5 Thickness measurements are to be witnessed by the Surveyor. This requires the Surveyor to be on board, while the measurements are carried out, to the extent necessary to control the process. This also applies to thickness measurements carried out while the ship is at sea.

Periodical Survey Regulations

Part 1, Chapter 3

Section 2

1.7.6 The Surveyor may extend the scope of thickness measurement if deemed necessary.

1.7.7 Where it is required as part of the survey to carry out thickness measurements for the structural areas subject to Close-up Survey, then these measurements are to be carried out simultaneously with the Close-up Survey.

1.7.8 Thickness measurements are to be taken in the forward and aft areas of all plates. Where plates cross ballast/cargo tank boundaries separate measurements for the area of plating in way of each type of tank are to be reported. In all cases the measurements are to represent the average of multiple measurements taken on each plate and/or stiffener. Where measured plates are renewed, the thicknesses of adjacent plates in the same strake are to be reported.

1.7.9 A report is to be prepared by the approved firm or Surveyor carrying out the thickness measurements. The report is to give the location of measurement, the thickness measured as well as the corresponding original thickness. The report is to give the date when measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator.

1.7.10 The thickness measurement report is to be verified and signed by the Surveyor and countersigned by an authorising Surveyor.

1.7.11 In all cases the extent of the thickness measurements is to be sufficient to represent the actual average condition.

1.8 Repairs

1.8.1 Any damage in association with wastage over the allowable limit (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the ship's structural, watertight or weathertight integrity, is to be promptly and thoroughly repaired. Areas to be considered include, (where fitted):

- side shell frames, their end attachments and adjacent shell plating;
- deck structure and deck plating;
- bottom structure and bottom plating;
- side structure and side plating;
- inner bottom structure and inner bottom plating;
- inner side structure and inner side plating;
- watertight or oiltight bulkheads;
- hatch covers and hatch coamings;
- the weld connection between air pipes and deck plating;
- air pipe heads installed on the exposed decks;
- ventilators, including closing devices.

For locations where adequate repair facilities are not available, consideration may be given to allow the ship to proceed directly to a repair facility. This may require discharging the cargo and/or temporary repairs for the intended voyage.

1.8.2 Additionally, when a survey results in the identification of structural defects or corrosion, either of which, in the opinion of the Surveyor, will impair the ship's fitness for continued service, remedial measures are to be implemented before the ship continues in service.

1.8.3 Where the damage found on structure mentioned in Pt 1, Ch 3, 1.8 Repairs is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the Surveyor to allow an appropriate temporary repair to restore watertight or weathertight integrity and impose a Condition of Class with a specific time limit.

■ Section 2

Annual Surveys - Hull and machinery requirements

2.1 General

2.1.1 Annual Surveys are to be held concurrently with statutory annual or other relevant statutory surveys, wherever practicable.

2.1.2 At Annual Surveys, the Surveyor is to examine the ship and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

2.1.3 For additional requirements for ships for liquefied gases, see Pt 1, Ch 3, 9 Ships for liquefied gases.

2.1.4 For ships which are required by International Convention to comply with the *International Safety Management Code* (ISM Code), the Surveyor is to review the overall effectiveness of the Code onboard ship. This is to be undertaken regardless of the organisation issuing the Safety Management Certificate (SMC).

2.1.5 For ships assigned the notation 'laid-up', in lieu of the normal Annual Survey requirements a general examination of the hull and machinery is to be carried out.

2.2 Annual Surveys

2.2.1 The survey is to include:

- (a) An examination for the purpose of ensuring, as far as practicable, that the hull, hatch covers, hatch coamings, closing appliances, equipment and related piping are maintained in a satisfactory condition.
- (b) Examination of weather decks, ship side plating above the waterline, hatch cover and coamings.
- (c) Examination of watertight penetrations as far as practicable.
- (d) Examination of the weld connection between air pipes, ventilators and deck plating.
- (e) External examination of all air pipe heads installed on exposed decks.
- (f) Examination of flame screens on air pipes to all bunker tanks.
- (g) Examination of ventilators including closing devices, if any.
- (h) The Surveyor is to be satisfied regarding the efficient condition of:
 - exposed casings, skylights, flush deck scuttles, deckhouses and companionways, superstructure bulkheads, side, bow and stern doors, side scuttles and deadlights, chutes and other openings, together with all closing appliances.
 - scuppers and sanitary discharges (so far as practicable); valves on discharge lines (so far as practicable) and their controls; guard rails and bulwarks; freeing ports, gangways and life-lines; fittings and appliances for timber deck cargoes.
 - bilge level detection and alarm systems on ships assigned a **UMS** notation.

2.2.2 The following requirements for hatch covers and coamings are applicable:

- (a) The Surveyor is to obtain confirmation that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the previous survey.
- (b) Where mechanically operated steel hatch covers are fitted, Surveyors are to confirm the satisfactory condition of:
 - hatch covers;
 - tightness devices of longitudinal, transverse and intermediate cross junctions (gaskets, gasket lips, compression bars, drainage channels);
 - clamping devices, retaining bars, cleating;
 - chain or rope pulleys;
 - guides;
 - guide rails and track wheels;
 - stoppers, etc;
 - wires, chains, gypsies, tensioning devices;
 - hydraulic system essential to closing and securing;
 - safety locks and retaining devices.
- (c) Where portable hatch covers, wooden or steel pontoons are fitted, Surveyors are to confirm the satisfactory condition of:
 - wooden covers and portable beams, carriers or sockets for the portable beam, and their securing devices;
 - steel pontoons;
 - tarpaulins;
 - cleats, battens and wedges;
 - hatch securing bars and their securing devices;
 - loading pads/bars and the side plate edge;
 - guide plates and chocks;
 - compression bars, drainage channels and drain pipes (if any).

Periodical Survey Regulations

Part 1, Chapter 3

Section 2

-
- (d) The Surveyor is to confirm the satisfactory condition of hatch coaming plating and their stiffeners, where applicable.
- (e) The Surveyor is to carry out random checking of the satisfactory operation of mechanically operated hatch covers including:
- stowage and securing in open condition,
 - proper fit and efficiency of sealing in closed condition,
 - operational testing of hydraulic and power components, wires, chains and link drives.
- (f) Where considered necessary by the Surveyor, the effectiveness of sealing arrangements may be proved by hose or chalk testing supplemented by dimensional measurements of seal compressing components.
- (g) For **general dry cargo ships** the survey is to include a close-up survey of the hatch covers, hatch coaming and stiffeners.
- (h) For **bulk carriers** the following requirements are also applicable:
- (i) The survey is to include a close-up survey of the hatch covers, hatch coaming and stiffeners.
 - (ii) A thorough survey of cargo hatch covers and coamings is only possible by their examination in an open and closed position, including verification of the proper opening and closing operation. As such, the hatch cover sets located in the forward 25 per cent of the ship's length and at least one other additional set are to be surveyed open, closed and in operation to the full extent on each direction in accordance with (Pt 1, Ch 3, 2.2 Annual Surveys) above. When selecting hatch cover sets it should be ensured that all sets are subject to survey at least once in every five-year Special Survey period. The closing of the covers is to include the fastening of all peripheral and cross joint cleats or other securing devices, with particular attention to be paid to the condition of the hatch covers located in the forward 25 per cent of the ship's length, where sea loads are normally greatest.
 - (iii) If there are indications of difficulty in operating and securing hatch covers, then additional sets are to be tested in operation at the discretion of the Surveyor.
 - (iv) Where the cargo hatch securing system does not function properly, repairs are to be carried out under the supervision of the Surveyor.
 - (v) Surveyors are to survey the sealing arrangements of perimeter and cross joints (gaskets for condition of permanent deformation, flexible seals on combination carriers, gasket lips, compression bars, drainage channels and non-return valves).
- 2.2.3 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, see Pt 3, Ch 4, 8 Loading guidance information. The operation of the loading instrument is to be verified in accordance with LR's certification procedure.
- 2.2.4 The anchoring and mooring equipment is to be examined so far as practicable.
- 2.2.5 The watertight doors in watertight bulkheads, their indicators and alarms, are to be examined and tested (locally and remotely), together with an examination of watertight bulkhead penetrations, so far as practicable.
- 2.2.6 The Surveyor is to examine and test in operation all main and auxiliary steering arrangements including their associated equipment and control systems, and verify that log book entries have been made in accordance with statutory requirements where applicable.
- 2.2.7 The Surveyor is to be satisfied regarding the freeboard marks on the ship's side.
- 2.2.8 The Surveyor is to generally inspect the machinery and boiler spaces, with particular attention being given to the propulsion system, auxiliary machinery and to the existence of any fire and explosion hazards. Emergency escape routes are to be checked to ensure that they are free of obstruction.
- 2.2.9 The means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the alternative steering position, if fitted, are to be tested.
- 2.2.10 The bilge pumping systems for each watertight compartment, including bilge wells, extended spindles, self-closing drain cocks, valves fitted with rod gearing or other remote operation, pumps and level alarms, where fitted, are to be examined and operated as far as practicable and all confirmed to be satisfactory. Any hand pumps provided are to be included.
- 2.2.11 Piping systems containing fuel oil, lubricating oil or other flammable liquids are to be generally examined and operated as far as practicable, with particular attention being paid to tightness, fire precaution arrangements, flexible hoses and sounding arrangements.
- 2.2.12 The Surveyor is to be satisfied regarding the condition of non-metallic joints in piping systems which penetrate the hull, where both the penetration and the non-metallic joint are below the deepest load waterline.

2.2.13 The main propulsion, essential auxiliary and emergency generators including safety arrangements, controls and foundations are to be generally examined. Surveyors are to confirm that Periodical Surveys of engines have been carried out as required by the Rules and that safety devices have been tested.

2.2.14 The boilers, other pressure vessels and their appurtenances, including foundations, controls, high pressure and waste steam piping and insulation and gauges, are to be generally examined. Surveyors should confirm that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules.

2.2.15 For boilers, the safety devices are to be tested, and the safety valves are to be operated using the relieving devices. For exhaust gas heated economisers/boilers, the safety valves are to be tested at sea by the Chief Engineer and details recorded in the log book.

2.2.16 The operation and maintenance records, repair history and feed water chemistry records of boilers are to be examined.

2.2.17 For other pressure vessels, the safety devices are to be examined.

2.2.18 The electrical equipment and cabling forming the main and emergency electrical installations are to be generally examined under operating conditions so far as practicable. The satisfactory operation of the main and emergency sources of power and electrical services essential for safety in an emergency is to be verified; where the sources of power are automatically controlled they should be tested in the automatic mode. Bonding straps for the control of static electricity and earthing arrangements are to be examined where fitted.

2.2.19 The electrical installation in areas which may contain flammable gas or vapour and/or combustible dust is to be examined in order to verify that it is in good condition and has been properly maintained.

2.2.20 For main propulsion, essential auxiliary and emergency machinery control engineering systems, a general examination of the equipment and arrangements is to be carried out. Records of modifications are to be made available for review by the attending Surveyor. The documentation required by Pt 6, Ch 1 Control Engineering Systems, including configuration management, are to be reviewed following system modifications to confirm compliance with applicable Rules. Satisfactory operation of the safety devices and control systems is to be verified. For ships having **UMS** or **CCS** notation, a general examination of the control engineering equipment required for these notations is also to be carried out.

2.2.21 For ships fitted with an electronically controlled engine for main propulsion, essential auxiliary or emergency power purposes the following is to be carried out to the satisfaction of the Surveyor:

- (a) Verification of evidence of satisfactory operation of the engine and where possible this is to include a running test under load.
- (b) Verification of satisfactory operation of the safety devices and control, alarm and monitoring systems.
- (c) Verification that any changes to the software or control, alarm, monitoring and safety systems that affect the operation of the engine have been assessed by LR and are under configuration management control.

2.2.22 Dead ship starting arrangements for bringing machinery into operation without external aid are to be tested to the Surveyor's satisfaction.

2.2.23 On ships fitted with a dynamic positioning system, the control system and associated machinery items are to be generally examined and tested to demonstrate that they are in good working order.

2.2.24 For ships to which a **PM** or **PMC** notation has been assigned in accordance with Pt 7, Ch 8, 1.2 Classification notations, the thruster assisted positional mooring system, control system and associated machinery items are to be generally examined and tested under operating conditions to an approved Test Schedule.

2.2.25 For ships fitted with positional mooring equipment in accordance with Pt 7, Ch 8 Positional Mooring and Thruster-Assisted Positional Mooring Systems, a schedule or rota of moorings to be examined at Annual Survey should be agreed for component parts of the positional moorings.

2.2.26 For ships having an **OPS** notation assigned, a General Examination of on-shore power supply arrangements is to be carried out in accordance with Pt 7, Ch 13 On-shore Power Supplies.

2.2.27 For ships to which Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements applies, the arrangements for fire protection, detection and extinction are to be examined and are to include:

- (a) Verification, so far as practicable, that no significant changes have been made to the arrangement of structural fire protection.
- (b) Verification of the operation of manual and/or automatic doors where fitted.
- (c) Verification that fire-control plans are properly posted.
- (d) Examination, so far as possible, and testing as feasible, of the fire and/or smoke detection and alarm system(s).

- (e) Examination of fire main system, and confirmation that each fire pump, including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants.
- (f) Verification that fire-hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations.
- (g) Examination of fixed fire-fighting systems controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing, including date of last systems tests.
- (h) Verification that all portable and semi-portable fire-extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random checks for evidence of discharged containers.
- (i) Verification, so far as practicable, that the remote control for stopping fans and machinery and shutting-off fuel supplies in machinery spaces and, where fitted, the remote controls for stopping fans in accommodation spaces and the means of cutting off power to the gallery are in good working order.
- (j) Examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnels, where applicable.
- (k) Verification that the firemen's outfits are complete and in good condition.

2.2.28 The examination of salt-water ballast tanks is to be carried out as follows:

- (a) Salt-water ballast tanks, other than double bottom ballast tanks, on all ships (excluding oil tankers and chemical tankers) where it has been identified at a previous Special Survey or Intermediate Survey that:
 - (i) A hard protective coating has not been applied from the time of construction; or
 - (ii) A soft or semi-hard coating has been applied; or
 - (iii) A hard protective coating is found to be in POOR condition, as defined in 1.5, and the hard protective coating is not repaired to the satisfaction of the Surveyor.

If the conditions listed above are applicable to double bottom ballast tanks, then these tanks may be subject to examination at the Annual Survey at the discretion of the Surveyor.

- (b) Salt-water ballast tanks on oil tankers (including ore/oil and ore/bulk/oil ships) and chemical tankers where it has been identified at a previous Special Survey or Intermediate Survey that:
 - (i) A hard protective coating has not been applied from the time of construction; or
 - (ii) A soft or semi-hard coating has been applied; or
 - (iii) The hard protective coating is found to be in less than GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, and the hard protective coating is not repaired to the satisfaction of the Surveyor.
- (c) The examination of the salt-water ballast tanks, in accordance with the above, is to include thickness measurements to confirm the condition of the hull structure.

2.2.29 The Surveyor is to carry out an examination and thickness measurement of structure identified at the previous Special Survey or Intermediate Survey as having substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions. This requirement does not apply to cargo tanks of oil tankers and chemical tankers. The extent of thickness measurements is to be in accordance with the appropriate Tables in Sections Pt 1, Ch 3, 5 Special Survey - General - Hull requirements, Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements or Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements, as applicable, to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out. For cargo holds and ballast tanks of bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the annual thickness measurement may be dispensed with where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition. Steel renewal requirements have been separately determined according to date of contract for construction for:

- (a) cargo hold hatch covers and coamings under IACS UR S21 and UR S21A; and
- (b) bulk carriers' corrugated transverse watertight hold bulkheads under IACS UR S18.

Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See Pt 1, Ch 3, 5.6 Thickness measurement, Pt 1, Ch 3, 6.7 Thickness measurement and Pt 1, Ch 3, 7.7 Thickness measurement.

2.2.30 For **oil tankers** (including ore/bulk/oil ships and ore/oil ships), in addition to the applicable requirements of Pt 1, Ch 3, 2.2 Annual Surveys to Pt 1, Ch 3, 2.2 Annual Surveys, the following are to be dealt with where applicable:

- (a) Examination of cargo tank openings including gaskets, covers, coamings and screens.

- (b) Examination of cargo tank venting arrangements including secondary means of venting, or over/under pressure alarms where fitted, with associated pressure/vacuum valves and flame screens.
- (c) Examination of flame screens on vents to all bunker, oily ballast and oily slop tanks and void spaces, so far as practicable.
- (d) Examination of cargo, crude oil washing, bunker, ballast and vent piping systems together with flame arresters and pressure/vacuum valves, as applicable above the upper deck within the cargo tank area, including vent masts and headers.
- (e) Verification that no potential sources of ignition such as loose gear, excessive products in the bilges, excessive vapours, combustible materials, etc. are present in or near the cargo pump room and that access ladders are in good condition.
- (f) Examination of cargo pump rooms and pipe tunnels (where fitted) and examination of all pump room bulkheads for signs of leakage or fractures and, in particular, the sealing arrangements of all penetrations in these bulkheads.
- (g) Verification that the pump room ventilation system is operational, ducting intact, dampers operational and screens are clean.
- (h) For ships to which Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements applies, the external examination of the piping and cut-out valves of cargo tank and cargo pump room fixed fire-fighting system.
- (i) For ships to which Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements applies, verification that the deck foam system and deck sprinkler system are in good operating condition.
- (j) Examination of the condition of all piping systems in the cargo pump room so far as practicable.
- (k) Examination, so far as practicable, of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of pump room bilge system, and checking that pump foundations are intact.
- (l) Verification that installed pressure gauges on cargo discharge lines and level indicator systems are operational.
- (m) Verification that at least one portable instrument for measuring flammable vapour concentrations is available, together with a sufficient set of spares and a suitable means of calibration.
- (n) Examination of any inert gas system, see Pt 1, Ch 3, 2.2 Annual Surveys.
- (o) For ballast tanks, in areas where substantial corrosion, as defined in 1.5, has been noted then additional measurements are to be carried out in accordance with Table 3.7.7 Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Bottom structure with substantial corrosion to Table 3.7.15 Thickness measurement - Double hull oil tankers - Transverse watertight and swash bulkhead structure in cargo tanks with substantial corrosion, as applicable. The survey will not be considered complete until these additional thickness measurements have been carried out.
- (p) Verification that any special arrangements made for bow or stern loading and unloading are in good condition.

2.2.31 For **chemical tankers**, in addition to the applicable requirements of Pt 1, Ch 3, 2.2 Annual Surveys to Pt 1, Ch 3, 2.2 Annual Surveys, the following are to be dealt with, where applicable:

- (a) Examination of gauging devices, high level alarms and valves associated with overflow control.
- (b) Verification that any devices provided for measuring the temperature of the cargo and any associated alarms are satisfactory.
- (c) Examination of the cargo heating/cooling system sampling arrangements where fitted.
- (d) Verification that wheelhouse doors and windows, side scuttles and windows in superstructure and deckhouse ends facing the cargo area are in good condition.
- (e) Verification that pump discharge pressure gauges fitted outside the cargo pump rooms are satisfactory.
- (f) Verification that pumps, valves and pipelines are identified and distinctively marked.
- (g) Verification that the remote operation of the cargo pump room bilge system is satisfactory.
- (h) Verification that cargo pump room rescue arrangements are in order.
- (i) Verification that removable pipe lengths or other approved equipment necessary for cargo separation are available, and satisfactory.
- (j) Verification that the ventilation system including portable equipment, if any, of all spaces in the cargo area is operational.
- (k) Verification that arrangements are made for sufficient inert/padding/drying gas to be carried to compensate for normal losses and that means are provided for monitoring of ullage spaces.
- (l) Verification that arrangements are made for sufficient medium to be carried where drying agents are used on air inlets to cargo tanks.
- (m) Verification that suitable protective clothing is available for crew engaged in loading and discharging operations and that suitable storage is maintained.
- (n) Verification that the requisite safety equipment and associated breathing apparatus with requisite air supplies and emergency escape respiratory and eye protection, if required, are in good condition and are properly stowed.
- (o) Verification that medical first aid equipment including stretchers and oxygen resuscitation is in good condition and that satisfactory arrangements are made for antidotes for cargoes actually carried to be on board.
- (p) Verification that decontamination arrangements are operational.

- (q) Verification that the requisite gas detection instruments are on board and that satisfactory arrangements are made for the supply of any required vapour detection tubes.
- (r) Verification that the cargo sample stowage arrangements are in good condition.
- (s) Verification that, if applicable, the provisions made for chemicals which have special requirements listed in Ch 17 Summary of Minimum Requirements of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* are in order.
- (t) For ballast tanks, in areas where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, has been noted then additional measurements are to be carried out in accordance with Table 3.8.5 Thickness measurement - Single and double hull chemical tankers - Bottom, inner bottom and hopper structure with substantial corrosion, Table 3.8.6 Thickness measurement - Single and double hull chemical tankers - Deck structure with substantial corrosion, Table 3.8.7 Thickness measurement - Single and double hull chemical tankers - Side shell and longitudinal bulkheads with substantial corrosion and Table 3.8.8 Thickness measurement - Single and double hull chemical tankers - Transverse watertight bulkheads and swash bulkheads with substantial corrosion. The survey will not be considered complete until these additional thickness measurements have been carried out.

2.2.32 For **inert gas systems**, where fitted, the following are to be dealt with:

- (a) External examination of the condition of piping including vent piping above the upper deck in the cargo tank area and overboard discharges through the shell so far as practicable, together with components for signs of corrosion or gas leakage/effluent leakage.
- (b) Verification of the proper operation of both inert gas blowers.
- (c) Checking the scrubber room ventilation system.
- (d) Checking, so far as practicable, of the deck water seal for automatic filling and draining and checking for presence of water carry-over. Checking the operation of the non-return valve.
- (e) Testing of all remotely operated or automatically controlled valves including the flue gas isolating valve(s).
- (f) Checking the interlocking features of soot blowers.
- (g) Checking that the gas pressure regulating valve automatically closes when the inert gas blowers are secured.
- (h) Checking, so far as practicable, the following alarms and safety devices of the inert gas system using simulated conditions where necessary:
 - (i) high oxygen content of gas in the inert gas main;
 - (ii) low gas pressure in the inert gas main;
 - (iii) low pressure in the supply to the deck water seal;
 - (iv) high temperature of gas in the inert gas main;
 - (v) low water pressure to the scrubber;
 - (vi) accuracy of portable and fixed oxygen measuring equipment by means of calibration gas.

2.2.33 For **bulk carriers**, in addition to the applicable requirements of Pt 1, Ch 3, 2.2 Annual Surveys to Pt 1, Ch 3, 2.2 Annual Surveys, the following are to be dealt with, where applicable:

- (a) Examination of cargo holds in accordance with Table 3.2.1 Bulk carriers - Annual Surveys is required.
- (b) Where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, has been noted then additional measurements are to be carried out in accordance with Table 3.6.5 Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion, Table 3.6.6 Thickness measurement - Single skin bulk carriers - Double bottom and hopper structure, with substantial corrosion, Table 3.6.7 Thickness measurement - Single and double skin bulk carriers - Transverse bulkheads in cargo holds, with substantial corrosion, Table 3.6.8 Thickness measurement - Single skin and double skin bulk carriers - Deck structure* with substantial corrosion, Table 3.6.9 Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion and Table 3.6.10 Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion. The survey will not be considered complete until these additional thickness measurements have been carried out.

For cargo holds and ballast tanks of bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the annual thickness measurement may be dispensed with where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition. Steel renewal requirements have been separately determined according to date of contract for construction for:

- (a) cargo hold hatch covers and coamings under IACS UR S21; and
- (b) corrugated transverse watertight hold bulkheads under IACS UR S18.

Periodical Survey Regulations

Part 1, Chapter 3

Section 2

Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See Pt 1, Ch 3, 5.6 Thickness measurement and Pt 1, Ch 3, 6.7 Thickness measurement.

- (a) For ships fitted with water level detectors in cargo holds, ballast tanks forward of the collision bulkhead and any dry or void space which extends forward of the foremost cargo hold, an examination and a test, at random, of the water ingress detection systems and of their alarms is to be carried out.
- (b) For ships fitted with a means for draining and pumping ballast tanks forward of the collision bulkhead and the bilges of dry spaces, any part of which extends forward of the foremost cargo hold, an examination and a test of the draining and pumping systems, including their controls, is to be carried out.
- (c) Examination of bunker and vent piping systems, including ventilators.

2.2.34 For **general dry cargo ships**, in addition to the applicable requirements of Pt 1, Ch 3, 2.2 Annual Surveys, the following are required for ships over 10 years of age:

- (a) Overall survey of one forward and one after cargo hold and their associated 'tween deck spaces.
- (b) When considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with Pt 1, Ch 3, 5 Special Survey - General - Hull requirements, Table 3.5.6 Thickness measurement - Additional requirements in way of structure identified with substantial corrosion. The survey will not be considered complete until these additional thickness measurements have been carried out. Steel renewal requirements have been separately determined according to date of contract for construction for cargo hold hatch covers and coamings under IACS UR S21A. Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See Pt 1, Ch 3, 5.6 Thickness measurement.

Table 3.2.1: Bulk carriers - Annual Surveys

Ships less than 10 years old	Ships between 10 and 15 years old	Ships greater than 15 years old
<p>An Overall Survey of the forward cargo hold and an aft cargo hold on single skin ships</p> <p>See Note 1</p>	<p>(a) Overall Survey of</p> <ul style="list-style-type: none"> (i) all cargo holds on single skin ships. (ii) two selected cargo holds on double skin ships. <p>(b) Close-up Survey of at least 25 per cent of the cargo hold side shell frames, their lower end attachments and adjacent shell plating in the forward cargo hold on single skin ships</p> <p>(c) Examination of all piping and penetrations in cargo holds including overboard piping.</p> <p>See Notes 2, 3, 4, and 5</p>	<p>(a) Overall Survey of all cargo holds</p> <p>(b) Close-up Survey of at least 25 per cent of the cargo hold side shell frames, their lower end attachments and adjacent shell plating in the forward cargo hold and one other selected cargo hold on single skin ships</p> <p>(c) Examination of all piping and penetrations in cargo holds including overboard piping</p> <p>See Notes 2, 3, 4, and 5</p>
<p>Note The requirements in this Table apply to both single skin and double skin ships, unless stated otherwise.</p> <p>Note 1. Where the Survey reveals the need for remedial measures, then the Survey is to be extended to include all cargo holds.</p> <p>Note 2. Close-up Survey is required within the area of the lower one-third of the length of the cargo hold side shell frames.</p> <p>Note 3. Where the Survey reveals the need for remedial measures, the Survey is to be extended to include a Close-up Survey of all of the cargo hold side shell frames and adjacent shell plating of that cargo hold, as well as a Close-up Survey of sufficient extent of all remaining cargo holds.</p>		

Note 4. When considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with Section 6, Table 3.6.5 Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion, Table 3.6.6 Thickness measurement - Single skin bulk carriers - Double bottom and hopper structure, with substantial corrosion, Table 3.6.7 Thickness measurement - Single and double skin bulk carriers - Transverse bulkheads in cargo holds, with substantial corrosion, Table 3.6.8 Thickness measurement - Single skin and double skin bulk carriers - Deck structure* with substantial corrosion, Table 3.6.9 Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion and Table 3.6.10 Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion as applicable. The survey will not be considered complete until these additional thickness measurements have been carried out.

Note 5. Where protective coatings are found in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of the Close-up Survey may be specially considered. When considered necessary by the Surveyor, thickness measurement is to be carried out. However, prior to any coating or recoating of cargo holds, scantlings are to be confirmed by thickness measurement with the Surveyor in attendance.

2.2.35 For **general dry cargo ships**, in addition to the applicable requirements of Pt 1, Ch 3, 2.2 Annual Surveys, the following are required for ships over 15 years of age:

- (a) Overall survey of all cargo holds and 'tween deck spaces.
- (b) Close-up Survey of at least 25 per cent of shell frames, including their end attachments and adjacent shell plating in a forward lower cargo hold and one other selected lower cargo hold. Close-up Survey is to include the lower one third length of the shell frames.
- (c) Where the survey reveals the need for remedial measures, then the survey is to be extended to include the Close-up Survey of all shell frames and adjacent shell plating in those cargo holds and associated tween deck spaces, as well as a Close-up Survey of sufficient extent of all remaining cargo holds and tween deck spaces.
- (d) Where the protective coatings in cargo holds are found in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of Close-up Survey may be specially considered.
- (e) When considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with Table 3.5.6 Thickness measurement - Additional requirements in way of structure identified with substantial corrosion in Pt 1, Ch 3, 5 Special Survey - General - Hull requirements. The survey will not be considered complete until these additional thickness measurements have been carried out. Steel renewal requirements have been separately determined according to date of contract for construction for cargo hold hatch covers and coamings under IACS UR S21A. Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See Pt 1, Ch 3, 5.6 Thickness measurement.

2.2.36 For **ship-borne barges** where surveys are permitted in accordance with Pt 1, Ch 2, 3.5 Existing ships – Periodical Surveys, see Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements.

2.2.37 For **roll on-roll off ships** (i.e. those that utilise a loading ramp which enables wheeled vehicles to be rolled on and rolled off the ship), in addition to the requirements of Pt 1, Ch 3, 2.2 Annual Surveys, the requirements of Pt 1, Ch 3, 2.2 Bow, inner, side shell and stern doors on Ro-Ro ships are to be complied with, as applicable. For ships other than roll on-roll off ships, fitted with bow doors, inner doors, side doors and stern doors, in addition to the requirements of Pt 1, Ch 3, 2.2 Annual Surveys, the following are to be satisfactorily dealt with, as applicable:

- (a) Verification of the freedom of movement of doors, and operation of their power units.
- (b) Examination of the door structure and surrounding ship structure.
- (c) Examination of the door sealing arrangements including gaskets and retaining bars.
- (d) Examination of the door cleating, locking and securing arrangements.
- (e) Examination of the door hinging arrangements.
- (f) Verification of the local and/or remote control of the securing devices/cleats.
- (g) Examination of all equipment associated with the opening, closing and securing of the door, e.g. wire ropes, chains, sheaves, rollers, guides, shackles, etc.
- (h) Verification of the tightness of the doors.
- (i) Examination and testing of remote control panels and associated indicator lights, closed circuit television systems, water leakage indicator lights and alarm systems.
- (j) Examination of the required notice boards and verification of log entries.

- (k) Verification of the satisfactory testing of the bilge systems for the space between the inner and outer bow doors and of the vehicle deck.
- (l) Verification that the approved Operation and Maintenance Manual is on board and satisfactorily maintained.

2.2.38 For **navigational arrangements for periodic one man watch** and **integrated bridge systems**, Annual Surveys are to be carried out in accordance with the approved test schedule as required by Pt 7, Ch 9, 1.2 Information and plans required to be submitted to ascertain that the equipment and arrangements required for the applicable class notation(s) are being maintained in good working order. At the time of the survey, relevant statutory certificates may be accepted as evidence of satisfactory operation.

2.2.39 For **liquefied gas ships**, see *also* Pt 1, Ch 3, 9 Ships for liquefied gases.

2.2.40 The Surveyor is to examine the fixed cargo securing fittings as far as necessary and practicable in order to be satisfied as to their general condition, see Pt 3, Ch 14, 10 Surveys.

2.2.41 Where the special features notation **CCSA** (certified container securing arrangements) is assigned, the Surveyor is to examine the securing arrangements including loose fittings so far as necessary and practicable in order to be satisfied as to their general condition, see Pt 3, Ch 14, 10 Surveys.

2.2.42 It is the responsibility of the onboard personnel to examine, maintain or renew cargo securing devices and maintain the appropriate certification. Records of inspections, maintenance and renewals, as well as the procedures for accepting, maintaining and repairing or rejecting cargo securing devices are to be kept onboard and made available to the attending Surveyor on request.

2.2.43 The Surveyor is to confirm that, for container ships which have the special features notation **BoxMax**, the onboard lashing program, together with its operation manual, is available on board, see Pt 3, Ch 4, 8 Loading guidance information. The operation of the program is to be verified in accordance with LR's certification procedure.

2.2.44 For single hold general dry cargo ships, other than bulk carriers, fitted with water level detectors in the cargo hold, an examination and a test, at random, of the water ingress detection system and alarms are to be carried out.

2.2.45 For **natural gas fuel installations** see *also* Pt 1, Ch 3, 23.3 Annual Surveys – General Requirements for Fuel Systems to Pt 1, Ch 3, 23.6 Annual Survey - Fuel Bunkering System

■ Section 3

Intermediate Surveys - Hull and machinery requirements

3.1 General

3.1.1 Intermediate Surveys are to be held concurrently with statutory annual or other relevant statutory surveys wherever practicable.

3.2 Intermediate Surveys

3.2.1 The requirements of Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements are to be complied with so far as applicable.

3.2.2 A general examination of salt water ballast tanks is to be carried out as required by Pt 1, Ch 3, 3.2 Intermediate Surveys and Pt 1, Ch 3, 3.2 Intermediate Surveys. For ships other than oil tankers and chemical tankers, if such examinations reveal no visible structural defects then the examination may be limited to a verification that the protective coating remains in GOOD or FAIR condition as defined in Pt 1, Ch 3, 1.5 Definitions.

3.2.3 In application of Pt 1, Ch 3, 3.2 Intermediate Surveys, Pt 1, Ch 3, 3.2 Intermediate Surveys and Pt 1, Ch 3, 3.2 Intermediate Surveys respectively for **oil tankers** (including ore/oil and ore/bulk/oil ships), **chemical tankers** and **bulk carriers** over 15 years of age a survey in dry-dock is to be a part of the Intermediate Survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of cargo tanks/holds and water ballast tanks are to be surveyed in accordance with the applicable requirements for Intermediate Surveys, if not already surveyed.

3.2.4 For **oil tankers** (including ore/oil and ore/bulk/oil ships) and **chemical tankers**, the condition of the corrosion prevention system identified during the Survey may result in the salt-water ballast tanks being subject to further examination at Annual Surveys, in accordance with Pt 1, Ch 3, 2.2 Annual Surveys.

Periodical Survey Regulations

Part 1, Chapter 3

Section 3

3.2.5 For salt-water ballast tanks on those ships not listed in Pt 1, Ch 3, 3.2 Intermediate Surveys, the condition of the corrosion prevention system identified during the Survey may result in the tanks being subject to further examination at Annual Surveys, in accordance with Pt 1, Ch 3, 2.2 Annual Surveys. For double bottom ballast tanks, the examination at Annual Surveys will be at the discretion of the Surveyor.

3.2.6 For ships over 5 years of age and up to 10 years of age, representative salt-water ballast tanks are to be examined. In addition to this, the following requirements are applicable:

- (a) For **general dry cargo ships**, an Overall Survey of representative salt-water ballast tanks, as selected by the Surveyor is to be carried out.
- (b) For **bulk carriers**, an Overall Survey of representative salt-water ballast tanks, as selected by the Surveyor is to be carried out. The selected tanks are to include the fore peak tank, aft peak tank and a number of other tanks, taking into account the total number and type of ballast tanks.
- (c) For **single hull oil tankers** (including ore/oil and ore/bulk/oil ships), an examination of all salt-water ballast tanks is to be carried out. Where considered necessary by the Surveyor, thickness measurement and testing are to be carried out to ensure the structural integrity remains effective.
- (d) For **double hull oil tankers** and **chemical tankers**, an Overall Survey of representative salt-water ballast tanks, as selected by the Surveyor is to be carried out. If the survey reveals no visible defects, the examination may be limited to a verification that the hard protective coating remains in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions.
- (e) Where a hard protective coating is found to be in POOR condition, as defined in Pt 1, Ch 3, 1.5 Definitions, where a soft or semi-hard coating has been applied, where a protective coating was not applied from the time of construction or other defects are found, the survey is to be extended to other ballast tanks of the same type.

3.2.7 For all ships over 10 years of age, the following are required:

- (a) All salt-water ballast tanks are to be examined.
- (b) The anchors are to be partially lowered and raised using the windlass.

3.2.8 The Surveyor is to carry out an examination and thickness measurement of structure identified at the previous Special Survey as having substantial corrosion, see *also* Pt 1, Ch 3, 5 Special Survey - General - Hull requirements, Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements and Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements. In addition, for double hull oil tankers built in accordance with the IACS Common Structural Rules (CSR), the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out in accordance with Table 3.7.11 Thickness measurement - Double hull oil tankers - Bottom, inner bottom and hopper structure with substantial corrosion to Table 3.7.15 Thickness measurement - Double hull oil tankers - Transverse watertight and swash bulkhead structure in cargo tanks with substantial corrosion.

3.2.9 For all ships, the electrical generating sets are to be examined under working conditions to verify compliance with Pt 6, Ch 2, 2.2 Number and rating of generators and converting equipment.

3.2.10 In addition to the foregoing, in the case of all **oil tankers** (including ore/oil and ore/bulk/oil ships) the following are to be dealt with where applicable:

- (a) An examination of cargo, crude oil washing, bunker, ballast, steam and vent piping on the weather decks, as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, gauged, or both.
- (b) A general examination within the zones and spaces deemed as hazardous, such as cargo pump rooms and spaces adjacent to and zones above cargo tanks, for defective and non-certified safe-type electrical equipment, improperly installed, defective and dead-end wiring. An electrical insulation resistance test of the circuits terminating in, or passing through, the hazardous zones and spaces is to be carried out. If the ship is not in a gas free condition the results of previously recorded test readings may be accepted.

3.2.11 For **oil tankers** (including ore/oil and ore/bulk/oil ships), in addition to Pt 1, Ch 3, 3.2 Intermediate Surveys, the following are required for ships over 10 years of age:

- (a) A survey to the same extent as the previous Special Survey (applicable only to ESP surveys, see Pt 1, Ch 3, 7.1 General).
- (b) Pressure testing of cargo and ballast tanks and the requirements for the longitudinal strength evaluation (see Pt 1, Ch 3, 7.7 Thickness measurement) are to be carried out if deemed necessary by the attending Surveyor.

3.2.12 For **chemical tankers**, in addition to the applicable requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys to Pt 1, Ch 3, 3.2 Intermediate Surveys the following are to be dealt with where applicable:

- (a) Examination of vent line drainage arrangements.
- (b) Verification that the cargo heating/cooling system is in good condition.
- (c) Verification that the ship's cargo hoses are approved and in good condition.
- (d) Verification that where applicable, pipelines and independent cargo tanks are electrically bonded to the hull.
- (e) An examination of cargo, cargo washing, bunker, ballast, steam and vent piping on the weather decks, as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the piping may require to be pressure tested, gauged or both.
- (f) A General Examination within the zones and spaces deemed as hazardous, such as cargo pump rooms and spaces adjacent to and zones above cargo tanks, for defective and non-certified safe-type electrical equipment, improperly installed, defective and dead-end wiring. An electrical insulation resistance test of the circuits terminating in, or passing through, the hazardous zones and spaces is to be carried out. If the ship is not in a gas free condition the results of previously recorded test readings may be accepted.

3.2.13 For **chemical tankers**, in addition to Pt 1, Ch 3, 3.2 Intermediate Surveys, the following are required for ships over 10 years of age:

- (a) A survey to the same extent as the previous Special Survey (applicable only to ESP surveys, see Pt 1, Ch 3, 8.1 General).
- (b) Pressure testing of cargo and ballast tanks is to be carried out if deemed necessary by the attending Surveyor.

3.2.14 For **bulk carriers**, in addition to the applicable requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys to Pt 1, Ch 3, 3.2 Intermediate Surveys, the following are to be dealt with on ships over five years of age:

- (a) Overall Survey, Close-up Survey and thickness measurements of cargo holds in accordance with Table 3.3.1 Bulk carriers - Intermediate Surveys.
- (b) For ore carriers, in addition to the requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys, the examination of salt-water ballast tanks is to include the following:
 - (i) All web frame rings in one ballast wing tank.
 - (ii) One deck transverse in each remaining ballast wing tank.
 - (iii) Both transverse bulkheads in one ballast wing tank.
 - (iv) One transverse bulkhead in each remaining ballast wing tank.
- (c) Steel renewal requirements have been separately determined according to date of contract for construction for:
 - (i) cargo hold hatch covers and coamings under IACS UR S21; and
 - (ii) corrugated transverse watertight hold bulkheads under IACS UR S18.

Where the gauged thickness is within the range $t_{net} + 0,5 \text{ mm}$ and $t_{net} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See Pt 1, Ch 3, 5.6 Thickness measurement and Pt 1, Ch 3, 6.7 Thickness measurement.

- (d) For bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the areas identified with substantial corrosion in cargo holds and ballast tanks may be either:
 - (i) protected by coating applied in accordance with the coating manufacturer's requirements and examined at Annual Surveys to confirm the coating in way is still in GOOD condition, or alternatively;
 - (ii) subject to thickness measurement at Annual Surveys.

3.2.15 For **bulk carriers**, in addition to the applicable requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys to Pt 1, Ch 3, 3.2 Intermediate Surveys, the following is required for ships over 10 years of age:

- (a) A survey to the same extent as the previous special Survey (applicable to ESP surveys, see Pt 1, Ch 3, 6.1 General).
- (b) Pressure testing of all tanks and the internal examination of fuel oil tanks are to be carried out if deemed necessary by the Surveyor.

3.2.16 For ships over 10 years old of age (other than dry cargo ships, general dry cargo ships, ships assigned **ESP** Notation and ships for liquefied gases), in addition to the applicable requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys to Pt 1, Ch 3, 3.2 Intermediate Surveys, an Overall Survey of selected cargo spaces is to be carried out.

3.2.17 For **dry cargo ships** over 15 years old (other than bulk carriers and general dry cargo ships), in addition to the applicable requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys to Pt 1, Ch 3, 3.2 Intermediate Surveys, an Overall Survey of selected cargo holds is to be carried out.

Periodical Survey Regulations

Part 1, Chapter 3

Section 3

3.2.18 For **general dry cargo ships**, in addition to the applicable requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys to Pt 1, Ch 3, 3.2 Intermediate Surveys, the following is required for ships over 5 years of age:

- An overall survey of one forward and one after cargo hold and their associated 'tween deck spaces.

3.2.19 For **general dry cargo ships**, in addition to the applicable requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys, the following are required for ships over 10 years of age:

- An overall survey of all cargo holds and 'tween deck spaces.
- Where considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with Table 3.5.6 Thickness measurement - Additional requirements in way of structure identified with substantial corrosion in Section 5. The survey will not be considered complete until these additional thickness measurements have been carried out. Steel renewal requirements have been separately determined according to date of contract for construction for cargo hold hatch covers and coamings under IACS UR S21A. Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. See Pt 1, Ch 3, 5.6 Thickness measurement.

3.2.20 For **general dry cargo ships**, in addition to the applicable requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys, the following are required for ships over 15 years of age:

- A survey to the same extent as the previous special Survey (applicable only to surveys of the hull structure and piping systems in way of the cargo holds, cofferdams, pipe tunnels and void spaces within the cargo area and all salt water ballast tanks).
- Tank testing, survey of automatic air pipe heads and internal examination of fuel oil, lubricating oil and fresh water tanks are to be carried out if deemed necessary by the Surveyor.

3.2.21 For **ship-borne barges**, where Intermediate Surveys are permitted as an alternative to Annual Surveys and Docking Surveys, all the hatch covers are to be hose tested at every survey. The external surfaces of the barges are to be surveyed at these surveys.

3.2.22 For **liquefied gas ships**, see Pt 1, Ch 3, 9 Ships for liquefied gases.

3.2.23 For **natural gas fuel installations** see also Pt 1, Ch 3, 23.7 Intermediate Surveys.

Table 3.3.1: Bulk carriers - Intermediate Surveys

Ships between 5 and 10 years old	Ships between 10 and 15 years old	Ships greater than 15 years old
(a) Overall Survey of all cargo holds, see Notes 1, 2, 3 and 4 (b) Close-up Survey to establish the condition of at least 25 per cent of the cargo hold side shell frames including their upper and lower end attachments, adjacent shell plating and the transverse bulkheads in the forward cargo hold and one other selected cargo hold on single skin ships, see Notes 1, 3 and 4.	A survey to the same extent as the previous Special Survey (applicable only to ESP surveys, see Pt 1, Ch 3, 6.1 General), see Note 3.	A survey to the same extent as the previous Special Survey (applicable only to ESP surveys, see Pt 1, Ch 3, 6.1 General), see Note 3.
<p>Note The requirements in this Table apply to both single skin and double skin ships, unless stated otherwise.</p> <p>Note 1. For single skin ships, where considered necessary by the Surveyor as a result of the Overall and Close-up Survey, the Survey is to be extended to include a Close-up Survey of all of the side shell frames and adjacent shell plating of that cargo hold, as well as a Close-up Survey of sufficient extent of all remaining cargo holds.</p> <p>Note 2. For double skin ships, where considered necessary by the Surveyor as a result of the Overall Survey, the Survey is to be extended to include a Close-up Survey of those areas of structure in cargo holds selected by the Surveyor.</p>		

Note 3. Thickness measurement is to be carried out of sufficient extent to determine the level of corrosion of those areas subject to Close-up Survey. If the results of thickness measurement indicate substantial corrosion, the extent of thickness measurement is to be in accordance with Section 6, Table 3.6.5 Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion to Table 3.6.10 Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion, as applicable. The survey will not be considered complete until these additional thickness measurements have been carried out.

Note 4. For ships between 5 and 10 years old where hard protective coatings in cargo holds are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of Close-up Survey and thickness measurement may be specially considered but not dispensed with in its entirety. Prior to any coating or recoating of cargo holds, scantlings are to be confirmed by thickness measurement with the Surveyor in attendance.

■ Section 4

Docking Surveys and In-water Surveys - Hull and machinery requirements

4.1 General

4.1.1 At Docking Surveys or In-water Surveys the Surveyor is to examine the ship and machinery, so far as necessary and practicable, in order to be satisfied as to the general condition.

4.1.2 For **oil tankers** (including ore/oil and ore/bulk/oil ships), **chemical tankers** and **bulk carriers** over 15 years of age the intermediate docking between Special Surveys is to be held in dry-dock. Further, this survey is to be held as part of the Intermediate Survey.

4.2 Docking Surveys

4.2.1 Where a ship is in dry-dock or on a slipway it is to be placed on blocks of sufficient height, and proper staging is to be erected as may be necessary, for the examination of the shell including bottom and bow plating, keel, stern, sternframe and rudder. The rudder is to be lifted for examination of the pintles if considered necessary by the Surveyor.

4.2.2 The shell plating is to be examined for excessive corrosion, deterioration due to chafing or contact with the ground and for undue unfairness or buckling. Special attention is to be given to the connection between the bilge strakes and the bilge keels.

4.2.3 The clearances in the rudder bearings are to be measured. Where applicable, pressure testing of the rudder may be required if deemed necessary by the Surveyor.

4.2.4 The sea connections and overboard discharge valves and cocks and their attachments to the hull are to be examined.

4.2.5 The propeller, sternbush and sea connection fastenings and the gratings at the sea inlets are to be examined.

4.2.6 Visible parts of side thrusters are to be examined. Other propulsion systems which also have manoeuvring characteristics (such as directional propellers, vertical axis propellers, water jet units) are to be examined externally with focus on the condition of gear housing, propeller blades, bolt locking and other fastening arrangements. Sealing arrangements of propeller blades, propeller shaft and steering column are to be verified.

4.2.7 The clearance in the sternbush and the efficiency of the oil glands are to be ascertained.

4.2.8 When chain cables are ranged, the anchors and cables are to be examined by the Surveyor, see *also* Pt 1, Ch 3, 5.3 Examination and testing, Pt 1, Ch 3, 5.3 Examination and testing, Pt 1, Ch 3, 5.3 Examination and testing and Table 3.5.1 Survey preparation.

4.2.9 Where the anti-fouling system is changed completely, or partial repair is carried out affecting 25 per cent or more of the antifouling system, the coating specification and anti-fouling system is to be examined by the Surveyor in accordance with the *IMO Convention on the Control of Harmful Anti-fouling Systems on Ships* (AFS 2001) and Ch 15 Corrosion Prevention of the Rules for Materials.

4.2.10 Where the antifouling system is changed completely, or partial repair is carried out affecting 25 per cent or more of the antifouling system, the coating specification and antifouling system is to be examined by the Surveyor in accordance with IMO Antifouling System Convention.

4.3 In-water Surveys

4.3.1 The Committee will accept an In-water Survey in lieu of the intermediate docking between Special Surveys required in a five year period on ships other than those covered in Pt 1, Ch 3, 4.1 General and where an ***IWS** notation is assigned, see Pt 1, Ch 2, 2.3 Class notations (hull).

4.3.2 The Committee may accept an In-water Survey in lieu of the intermediate docking between Special Surveys required in a five year period on ships where suitable protection is applied to the underwater portion of the hull. If requested, and providing that there is suitable access for the taking of rudder pintle and bush clearances and for verifying the security of pintles in their sockets while the vessel is afloat, an ***IWS** notation may be assigned on satisfactory completion of the Survey, provided that the applicable requirements of LR's Rules and Regulations are complied with, see *also* Pt 1, Ch 2, 2.3 Class notations (hull).

4.3.3 The In-water Survey is to provide the information normally obtained from the Docking Survey.

4.3.4 When there is no access, special consideration shall be given to ascertaining rudder bearing clearances and sternbush clearances based on a review of the operating history, on board testing and stern bearing oil analysis. These considerations are to be included in the proposals for In-water Surveys which are to be submitted in advance of the survey being required, so that satisfactory arrangements can be agreed with LR.

4.3.5 The In-water Survey is to be carried out at an agreed geographical location under the surveillance of a Surveyor to LR, with the ship at a suitable draught in sheltered waters and with weak tidal streams and currents. The in-water visibility and the cleanliness of the hull below the waterline is to be clear enough to permit a meaningful examination which allows the Surveyor and diver to determine the condition of the plating, appendages and the welding. The Surveyor is to be satisfied that the method of pictorial presentation is satisfactory. There is to be good two-way communication between the Surveyor and the diver.

4.3.6 Prior to commencing the In-water Survey, the equipment and procedures for both observing and reporting the survey are to be agreed between the Owners, the Surveyor and the diving firm.

4.3.7 The In-water Survey is to be carried out by a qualified diver employed by a firm approved by LR.

4.3.8 If the In-water Survey reveals damage or deterioration that requires early attention, the Surveyor may require that the ship be dry-docked in order that a fuller survey can be undertaken and the necessary work carried out.

4.3.9 Where a vessel has an ***IWS** notation, the condition of the high resistance paint is to be confirmed at each dry-docking in order that the ***IWS** notation can be maintained.

4.3.10 Some National Administrations may have requirements additional to those of Pt 1, Ch 3, 4.3 In-water Surveys to Pt 1, Ch 3, 4.3 In-water Surveys.

■ Section 5
Special Survey - General - Hull requirements**5.1 General**

5.1.1 The survey is to be of sufficient extent to ensure that the hull and related piping are in satisfactory condition and are fit for the intended purpose for the new period of class of five years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out as required by the Regulations.

5.1.2 The requirements of Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements are to be complied with as applicable for all ships.

5.1.3 Additional requirements for **general dry cargo ships** are given in this Section; **dry bulk cargo ships bulk carriers** in Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements; **oil tankers** (including ore/oil ships and ore/bulk/oil ships) in Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements; **chemical tankers** in Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements; **ships for liquefied gases** in Pt 1, Ch 3, 9 Ships for liquefied gases.

5.1.4 A Docking Survey in accordance with the requirements of Pt 1, Ch 3, 4 Docking Surveys and In-water Surveys - Hull and machinery requirements is to be carried out as part of the Special Survey.

Periodical Survey Regulations

Part 1, Chapter 3

Section 5

5.1.5 During the Docking Survey, for general dry cargo ships, oil tankers (including ore/oil ships and ore/bulk/oil ships), chemical tankers and bulk carriers, the overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo spaces and ballast tanks are to be carried out as required, if not already surveyed.

5.1.6 For ships assigned the notation 'laid-up', an Underwater Examination (UWE) and general examination of hull and machinery is to be carried out in lieu of the normal Special Survey requirements.

5.1.7 For roll on-roll off ships (i.e. those fitted with a loading ramp which enables wheeled vehicles to be rolled on and rolled off the ship), in addition to the requirements of this Section, the requirements of Pt 1, Ch 3, 22 Bow, inner, side shell and stern doors on Ro-Ro ships are to be complied with, as applicable.

5.2 Preparation

5.2.1 The ship is to be prepared for Overall Survey in accordance with the requirements of Table 3.5.1 Survey preparation. The preparation should be of sufficient extent to facilitate an examination to ascertain any significant corrosion, deformation, fractures, damages and other structural deterioration.

Table 3.5.1: Survey preparation

Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)
<p>(1) The holds, 'tween decks, peaks, deep tanks, engine and boiler spaces, and other spaces, are to be cleared and cleaned as necessary, and the bilges and limbers all fore and aft are to be cleaned and prepared for examination. Platform plates in engine and boiler spaces are to be lifted as may be necessary for the examination of the structure below. Where necessary, close and spar ceiling, lining and pipe casings are to be removed for examination of the structure</p> <p>(2) In ships having a single bottom, a sufficient amount of close ceiling is to be lifted all fore and aft on each side from the bottom and bilges to permit the structure below to be examined</p>	<p>In addition to the requirements for Special Survey I, the following are to be complied with:</p> <p>(1) A sufficient amount of ceiling in the holds and other spaces is to be removed from the bilges and inner bottom to enable the condition of the structure in the bilges, the inner bottom plating, pillar feet, and the bottom plating of bulkheads and tunnel sides to be examined. If the Surveyor deems it necessary, the whole of the ceiling is to be removed</p> <p>(2) In ships having a single bottom, the limber boards and ceiling equal to not less than three strakes, all fore and aft on each side are to be removed, one such strake being taken from the bilges. Where the ceiling is fitted in hatches, the whole of the hatches and at least one strake of ceiling in the bilges are to be removed. If the Surveyor deems it necessary the whole of the ceiling and limber boards are to be removed</p>	<p>In addition to the requirements for Special Survey II the following are to be complied with:</p> <p>(1) Ceiling in holds is to be removed in order to ascertain that the steelwork is in good condition, free from rust and coated. If the Surveyor is satisfied, after removal of portions of the ceiling then it need not all be removed</p> <p>(2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating</p>

Periodical Survey Regulations

Part 1, Chapter 3

Section 5

<p>(3) In ships having a double bottom, a sufficient amount of ceiling is to be removed from the bilges and inner bottom to enable the condition of the plating to be ascertained. If it is found that the plating is clean and in good condition, and free from rust, the removal of the remainder of ceiling may be dispensed with. The Surveyor may waive the removal of heavy reinforced compositions if there is no evidence of leakages, cracking or other faults in the composition</p> <p>(4) Casings, ceilings or linings and loose insulation, where fitted, are to be removed for examination of plating and framing, as required by the Surveyor. Compositions on plating are to be examined and sounded, but need not be disturbed if found to be adhering satisfactorily to the plating. Where structural defects are identified, any applied composition is to be locally removed to enable further examination of the plating and adjacent frames, as required by the Surveyor</p> <p>(5) The steelwork is to be exposed and cleaned and rust removed as may be required for its proper examination by the Surveyor</p> <p>(6) All tanks are to be cleaned as necessary to permit examination, where this is required by Table 3.5.2 Tank internal examination requirements</p> <p>(7) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor</p>	<p>(3) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection</p>	<p>All subsequent Special Surveys</p> <p>In addition to the requirements for Special Survey III the following are to be complied with:</p> <p>(1) In refrigerated cargo spaces, sufficient insulation is to be removed in each of the chambers to enable the Surveyor to be satisfied as to the condition of the steel structure, and to enable the thickness of the structure to be ascertained as required by Pt 1, Ch 3, 5.6 Thickness measurement</p>
--	--	---

5.3 Examination and testing

5.3.1 All spaces within the hull and superstructure are to be examined.

5.3.2 The requirements for tank internal examination are given in Table 3.5.2 Tank internal examination requirements.

Table 3.5.2: Tank internal examination requirements

Tank	Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)	Special Survey IV and subsequent (Ships 20 years old and over)
(1) Peaks	All tanks	All tanks	All tanks	All tanks
(2) Salt water ballast, see Note 5	All tanks	All tanks	All tanks	All tanks
(3) Lubricating oil	None	None	None	One tank
(4) Fresh water	None	One tank	All tanks	All tanks
(5) Fuel oil - in way of (i) Engine Room	None	None	One tank	One tank

Periodical Survey Regulations

Part 1, Chapter 3

Section 5

	(ii) Cargo Area	None	One tank	Two tanks, Note 3	50% of tanks - Note 3 and 4.
Note 1. The above requirements apply to integral tanks only. Note 2. Where a selected number of tanks are examined, then different tanks are to be examined at each Special Survey on a rotational basis.			Note 3. To include one deep tank, if any. Note 4. Where 50% of tanks are to be examined, a minimum of two tanks are required to be examined depending upon the overall number of tanks. Note 5. The requirements for Salt-water ballast tanks are applicable to Bilge water, Sewage and Grey water tanks.		

5.3.3 For **oil tankers** (including ore/oil and ore/bulk/oil ships) and **chemical tankers**, the condition of the corrosion prevention system, where provided, is to be examined in cargo tanks and salt-water ballast tanks. When considered necessary by the Surveyor, thickness measurements are to be carried out. The condition of the corrosion prevention system identified during the Survey may result in the salt-water ballast tanks being subject to further examination at Annual Surveys, in accordance with Pt 1, Ch 3, 2.2 Annual Surveys.

5.3.4 For those ships not listed in Pt 1, Ch 3, 5.3 Examination and testing, the condition of the corrosion prevention system, where provided, in salt-water ballast tanks is to be examined. When considered necessary by the Surveyor, thickness measurements are to be carried out. The condition of the corrosion prevention system identified during the Survey may result in the salt-water ballast tanks being subject to further examination at Annual Surveys, in accordance with Pt 1, Ch 3, 2.2 Annual Surveys. For double bottom ballast tanks, the examination at Annual Surveys will be at the discretion of the Surveyor.

5.3.5 Double bottom, deep, ballast, peak and other tanks, including cargo holds assigned also for the carriage of salt water ballast, are to be tested with a head of liquid to the top of air pipes or to near the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lubricating oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise to under service conditions. Tank testing of fuel oil, lubricating oil and fresh water tanks may be specially considered based upon a satisfactory external examination of the tank boundaries, and a confirmation from the Master stating that the pressure testing has been carried out according to the requirements with satisfactory results. Surveyors may extend the testing as deemed necessary.

For **oil tankers** (including ore/oil and ore/bulk/oil ships) and **chemical tankers**, the minimum requirements for cargo tank testing are to be in accordance with Sections Pt 1, Ch 3, 7.5 Testing and Pt 1, Ch 3, 8.5 Testing, as applicable.

5.3.6 Where repairs are effected to the shell plating or bulkheads, any tanks in way are to be tested to the Surveyor's satisfaction on completion of these repairs.

5.3.7 On ship-borne barges, in lieu of water testing, tanks and cofferdams may be air tested.

5.3.8 In cases where the inner surface of the bottom plating is covered with cement, asphalt, or other composition, the removal of this covering may be dispensed with, provided that it is inspected, tested by beating or chipping, and found sound and adhering satisfactorily to the steel.

5.3.9 All decks, casings and superstructures are to be examined.

5.3.10 Wood decks or sheathing are to be examined. If decay or rot is found or the wood is excessively worn, the wood is to be renewed. When a wood deck, laid on stringers and ties, has worn by 15 mm or more, it is to be renewed. Attention is to be given to the condition of the plating under wood decks, sheathing or other deck covering. If it is found that such coverings are broken, or are not adhering closely to the plating, sections are to be removed as necessary to ascertain the condition of the plating, *see also* Pt 1, Ch 3, 1.2 Surveys for damage or alterations.

5.3.11 Mechanically-operated hatch covers are to be tested to confirm satisfactory operation including stowage; and securing in open condition; proper fit and efficiency of sealing in closed conditions; operational testing of hydraulic and power components, wires, chains and link drives. The effectiveness of sealing arrangements of all hatch covers is to be checked by carrying out hose testing or equivalent.

5.3.12 The masts and standing rigging are to be examined.

5.3.13 The anchors are to be examined. If the chain cables are ranged they are to be examined. If any length of chain cable is found to be reduced in mean diameter at its most worn part by 12 per cent or more from its nominal diameter, it is to be renewed. The windlass is to be examined. For equipment forming part of a positional mooring system, *see* Pt 1, Ch 3, 5.3 Examination and testing.

5.3.14 The chain cables are to be ranged and examined on all ships over five years old.

5.3.15 The Surveyor is to be satisfied that there are suitable mooring ropes when these are a Rule requirement.

5.3.16 On ships fitted with positional mooring equipment in accordance with Pt 7, Ch 8 Positional Mooring and Thruster-Assisted Positional Mooring Systems, or wire rope anchor cables in accordance with Pt 3, Ch 13, 7 Equipment, the anchors are to be cleaned and examined. Wire rope anchor cables are to be examined. If cables are found to contain broken, badly corroded or birdcaging wires they are to be renewed. Chain cables are to be ranged and examined. If any length of chain cable is found to be reduced in mean diameter at its most worn part by 12 per cent or more from its nominal diameter it is to be renewed. The windlass(es) or winches are to be examined.

5.3.17 The hand pumps, suction, watertight doors, air and sounding pipes are to be examined. In addition, the Surveyor is to internally and externally examine air pipe heads in accordance with the requirements of Table 3.5.7 Air pipe head internal examination requirements (applicable for automatic air pipe heads installed on exposed decks of all ships except passenger ships).

5.3.18 The Surveyor is to be satisfied as to the efficient condition of the following:

- (a) For ships to which Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements applies, means of escape from crew and passenger spaces, and spaces in which crew are normally employed.
- (b) Helm indicator, protection of aft steering wheel and gear.

5.3.19 Where the special features notation **CCSA** (certified container securing arrangements) is assigned, the Surveyor is to be satisfied as to the efficient condition of:

- (a) Cell guide structure including the connections between vertical cell guides and cross ties.
- (b) Cell guide entry devices.
- (c) Portable frameworks or other forms of structural restraints.
- (d) Fittings attached to the ship structure, with special attention to any signs of leakage in way of tanks or deck and shell plating.
- (e) End connecting pieces for lashings, twist locks and other loose fittings, which are to be examined and verified with the Register, see Pt 3, Ch 14, 10 Surveys.
- (f) Lashings, rods, wire ropes, and chains together with turn buckles and other tightening devices are to be examined and verified with the Register as far as necessary and practicable in order to be satisfied as to their general condition, see Pt 3, Ch 14, 10 Surveys.
- (g) Lashing wire ropes, which are to be renewed where more than five per cent of the wires are broken, worn or corroded in any length of 10 diameters of the wire rope.
- (h) Chains, which are to be renewed where worn or damaged.

Where renewals are required, the new item is to be of approved type and manufacture. Where test certificates are not available, the item is to be tested in accordance with Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing.

5.3.20 It is the responsibility of the onboard personnel to examine, maintain or renew cargo securing devices and maintain the appropriate certification. Records of inspections, maintenance and renewals, as well as the procedures for accepting, maintaining and repairing or rejecting cargo securing devices are to be kept onboard and made available to the attending Surveyor on request.

5.3.21 All bilge and ballast piping systems are to be examined and operationally tested to working pressure, to the satisfaction of the Surveyor, to ensure that tightness and condition remain satisfactory.

5.3.22 For engine room and machinery space fire dampers the following is applicable:

- (a) At Special Survey I, Surveyors are to select and internally examine one engine room fire damper and one machinery space fire damper. Where considered necessary by the Surveyor as a result of the examinations, the extent of examinations may be extended to include other fire dampers.
- (b) At each subsequent Special Survey, all engine room and machinery space fire dampers are to be internally examined by the Surveyor.

Note The examination of fire dampers may be specially considered by the Surveyor where there is satisfactory documented evidence of their replacement within the previous five years.

5.3.23 In refrigerated cargo spaces, the condition of the coating and structure behind the insulation is to be examined at representative locations. Surveyors may limit the examination to the verification that the protective coating remains effective and that there are no visible structural defects. Where POOR coating condition is found, or structural defects are identified, then sufficient insulation is to be removed in each of the chambers in order to assess the condition of the remaining structure, as deemed necessary by the Surveyor. Additionally, where indents, scratches or other defects are identified during the survey of the shell plating from the outside, insulations in way are to be removed to enable further examination of the plating and adjacent frames, as required by the Surveyor.

Periodical Survey Regulations

Part 1, Chapter 3

Section 5

5.4 Overall Survey

5.4.1 The following requirements are applicable to **general dry cargo ships**.

5.4.2 All cargo holds, salt-water ballast tanks including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this is to be supplemented by Close-up Survey, thickness measurement and testing as deemed necessary, to ensure that the structural integrity remains effective.

5.4.3 The examination is to be sufficient to ascertain substantial corrosion, significant deformation, fractures, damages or other structural deterioration and, if deemed necessary by the Surveyor, suitable non-destructive examination may be required.

5.4.4 All piping systems within the tanks and spaces indicated in Pt 1, Ch 3, 5.4 Overall Survey are to be examined and operationally tested to working pressure to the satisfaction of the Surveyor, to ensure that conditions remain satisfactory.

5.4.5 Where the salt-water ballast tanks have been converted to void spaces, the survey extent is to be specially considered based upon salt-water ballast tank requirements.

5.4.6 For single hold general dry cargo ships, other than bulk carriers, fitted with water level detectors in the cargo hold, an examination and a test of the water ingress detection system and alarms are to be carried out.

5.5 Close-up Survey

5.5.1 The following requirements are applicable to **general dry cargo ships**.

5.5.2 The minimum requirements for Close-up Survey are given in Table 3.5.4 Close-up Survey - General dry cargo ships. The Close-up Survey may be extended, as deemed necessary by the Surveyor, after taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

5.5.3 For areas in tanks and cargo holds where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of Close-up Surveys may be specially considered.

5.6 Thickness measurement

5.6.1 The general minimum requirements for thickness measurement are given in Table 3.5.3 Thickness measurement - General. For **general dry cargo ships**, the minimum requirements for thickness measurement are given in Table 3.5.5 Thickness measurement - General dry cargo ships. The Surveyor may extend the thickness measurements as deemed necessary.

Table 3.5.3: Thickness measurement - General

Special Survey I (Ships 5 years old)	Special Survey III (Ships 15 years old)	Special Survey IV and subsequent (Ships 20 years old and over)
(1) Critical areas, as required by the Surveyor	(1) Within 0,5L amidships; 2 transverse sections in way of two different cargo spaces, see Notes 2, 3 and 4	(1) Within 0,5L amidships; a minimum of 3 transverse sections in way of cargo spaces, see Notes 2, 3 and 4
Special Survey II (Ships 10 years old)	(2) All cargo hold hatch covers and coamings (plating and stiffeners)	(2) All cargo hold hatch covers and coamings (plating and stiffeners)
(1) Within 0,5L amidships; 1 transverse section of deck plating in way of a cargo space	(3) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 3 and 5	(3) All exposed main deck plating over full length of ship
(2) Critical areas, as required by the Surveyor	(4) Critical areas, as required by the Surveyor	(4) All wind and water strakes over the full length of the ship, port and starboard
		(5) Representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck)

Periodical Survey Regulations

Part 1, Chapter 3

Section 5

		<p>(6) Lowest strake and strakes in way of 'tween deck of all transverse bulkheads in cargo spaces together with internals in way, see Note 3</p> <p>(7) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 3 and 5</p> <p>(8) All keel plates over the full length of the ship. Also additional bottom plates in way of cofferdams, machinery space and aft end of tanks</p> <p>(9) Plating of seachests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor</p> <p>(10) Critical areas, as required by the Surveyor</p>
<p>Note 1. Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement, and condition of protective coatings.</p> <p>Note 2. A transverse section is to include all longitudinal members such as plating, longitudinals and girders at the deck, sides, bottom, inner bottom, hopper side and longitudinal bulkheads, where fitted.</p> <p>Note 3. Where the protective coating is in GOOD condition, then the extent of thickness measurements of internals may be specially considered, but not dispensed with in its entirety, at the discretion of the Surveyor.</p> <p>Note 4. For ships having length L less than 100 m: (a) the number of transverse sections required at Special Survey III may be reduced to one; (b) the number of transverse sections required at Special Survey IV and subsequent surveys may be reduced to two; (c) at Special Survey III, thickness measurements of exposed deck plating within $0,5L$ amidships may be required.</p> <p>Note 5. Transverse bulkhead complete including stiffening system.</p> <p>Note 6. The requirements for thickness measurement for bulk carriers, oil tankers (including ore/oil and ore/bulk/oil ships), chemical tankers and ships for liquefied gases are given in Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements and Pt 1, Ch 3, 9 Ships for liquefied gases respectively.</p>		

Table 3.5.4: Close-up Survey - General dry cargo ships

Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)	Special Survey IV and subsequent (Ships 20 years old and over)
(1) Selected shell frames in one forward and one aft cargo hold and associated tween deck spaces.	(1) Selected shell frames in all cargo holds and tween deck spaces.	(1) All shell frames in the forward lower cargo hold and 25% of shell frames in each remaining cargo hold and tween deck spaces, including their end attachments and adjacent shell plating.	(1) All shell frames in all cargo holds and tween deck spaces, including their end attachments and adjacent shell plating.

Periodical Survey Regulations

Part 1, Chapter 3

Section 5

(2) One selected cargo hold transverse bulkhead.	(2) One transverse bulkhead in each cargo hold, including stiffening system.	(2) All cargo hold transverse bulkheads, including stiffening system.	(2) All cargo hold transverse bulkheads, including stiffening system.
(3) All cargo hold hatch covers and coamings (plating and stiffeners).	(3) Forward and aft transverse bulkhead in one side ballast tank, including stiffening system.	(3) All transverse bulkheads in ballast tanks, including stiffening system.	(3) All transverse bulkheads in ballast tanks, including stiffening system.
	(4) One transverse web with associated plating and framing in two representative water ballast tanks of each type (i.e. topside, hopper side, side tank or double bottom tank).	(4) All transverse webs with associated plating and framing in each water ballast tank.	(4) All transverse webs with associated plating and framing in each water ballast tank.
	(5) All cargo hold hatch covers and coamings (plating and stiffeners).	(5) All cargo hold hatch covers and coamings (plating and stiffeners).	(5) All cargo hold hatch covers and coamings (plating and stiffeners).
	(6) Selected areas of all deck plating and underdeck structure inside the line of hatch openings between cargo hold hatches.	(6) All deck plating and underdeck structure and inside the line of hatch openings between cargo hold hatches.	(6) All deck plating and underdeck structure inside the line of hatch openings between cargo hold hatches.
	(7) Selected areas of inner bottom plating.	(7) All areas of inner bottom plating.	(7) All areas of inner bottom plating.

Note 1. Close-up survey of cargo hold transverse bulkheads to be carried out at the following areas: (i) Immediately above the inner bottom and immediately above the tween decks, as applicable. (ii) Mid-height of the bulkhead for the holds without tween decks. (iii) Immediately below the main deck plating and tween deck plating.

Note 2. Ballast tank includes peak tanks.

Table 3.5.5: Thickness measurement - General dry cargo ships

Special Survey I (Ships 5 years old)	Special Survey III (Ships 15 years old)	Special Survey IV and subsequent (Ships 20 years old and over)
(1) Critical areas, as required by the Surveyor.	(1) Within 0,5L amidships; 2 transverse sections in way of two different cargo spaces, see Notes 2, 3 and 4.	(1) Within 0,5L amidships; a minimum of 3 transverse sections, see Notes 2, 3 and 4
Special Survey II (Ships 10 years old)	(2) Measurements for the general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey in accordance with Table 3.5.4 Close-up Survey - General dry cargo ships, see Note 5.	(2) Measurements for the general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey in accordance with Table 3.5.4 Close-up Survey - General dry cargo ships, see Note 5.
(1) Within 0,5L amidships; 1 transverse section of deck plating in way of a cargo space.	(3) Within the cargo length area; (i) Each deck plate outside the line of cargo hatch openings. (ii) All wind and water strakes.	(3) Within the cargo length area; (i) Each deck plate outside the line of cargo hatch openings. (ii) Each bottom plate, including turn of bilge. (iii) Duct keel or pipe tunnel plating and internals.

Periodical Survey Regulations

<p>(2) Measurements for the general assessment and recording of corrosion pattern of those structural members subject to Close-up Survey in accordance with Table 3.5.4 Close-up Survey - General dry cargo ships, see Note 5.</p>	<p>(4) Selected wind and water strakes outside the cargo length area.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners).</p>	<p>(4) All wind and water strakes over the full length of the ship, port and starboard.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners).</p>
<p>(3) Critical areas, as required by the Surveyor.</p>	<p>(6) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 3 and 6.</p> <p>(7) Critical areas, as required by the Surveyor</p>	<p>(6) Remaining exposed main deck plates not considered in item (3) and representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck).</p> <p>(7) Lowest strake and strakes in way of 'tween deck of all transverse bulkheads in cargo spaces together with internals in way, see Note 3.</p> <p>(8) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Note 3 and 6.</p> <p>(9) All keel plates over the full length of the ship. Also additional bottom plates in way of cofferdams, machinery spaces and aft end of tanks.</p> <p>(10) Plating of seachests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor.</p> <p>(11) Critical areas, as required by the Surveyor</p>
<p>Note 1. Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement, and condition of protective coatings.</p> <p>Note 2. A transverse section is to include all longitudinal members such as plating, longitudinals and girders at deck, sides, bottom, inner bottom, hopper side and longitudinal bulkheads, where fitted.</p> <p>Note 3. Where the protective coating is in GOOD condition, then the extent of thickness measurements of internals may be specially considered, but not dispensed with in its entirety, at the discretion of the Surveyor.</p> <p>Note 4. For ships having length <i>L</i> less than 100 m: (a) the number of transverse sections required at Special Survey III may be reduced to one. (b) the number of transverse sections required at Special Survey IV and subsequent surveys may be reduced to two.</p> <p>Note 5. For areas in cargo holds and salt-water ballast tanks subject to Close-up Survey, the thickness measurements may be dispensed with provided the Surveyor is satisfied with the Close-up Survey examination, that there is no structural diminution and the protective coating remains effective.</p> <p>Note 6. Transverse bulkhead complete including stiffening system.</p>		

5.6.2 Thickness measurements may be carried out in association with the fourth Annual Survey.

5.6.3 In areas where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, has been noted, then additional measurements are to be carried out, as applicable, in accordance with Table 3.5.6 Thickness measurement - Additional requirements in way of structure identified with substantial corrosion to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out.

Periodical Survey Regulations

Part 1, Chapter 3

Section 5

Table 3.5.6: Thickness measurement - Additional requirements in way of structure identified with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect areas and adjacent plates	5 point pattern over 1m ²
Stiffeners	Suspect areas	3 measurements each in line across web and flange

Table 3.5.7: Air pipe head internal examination requirements (applicable for automatic air pipe heads installed on exposed decks of all ships except passenger ships)

Special Survey I (Ships 5 years old)		Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old) and subsequent
(1)	Two air pipe heads (one port and one starboard) on exposed decks in the forward 0,25L. See Notes 1 to 5	(1) All air pipe heads on exposed decks in the forward 0,25L. See Notes 1 to 5	All air pipe heads on exposed decks. See Notes 1 to 6
(2)	Two air pipe heads (one port and one starboard) on the exposed decks, serving spaces aft of 0,25L. See Notes 1 to 5	(2) At least 20% of air pipe heads on exposed decks, serving spaces aft of 0,25L. See Notes 1 to 5	
<p>Note 1. Air pipe heads serving ballast tanks are to be selected where available.</p> <p>Note 2. The Surveyor is to select which air pipe heads are to be examined.</p> <p>Note 3. Where considered necessary by the Surveyor as a result of the examinations, the extent of examinations may be extended to include other air pipe heads on exposed decks.</p> <p>Note 4. Where the inner parts of air pipe head cannot be properly examined due to its design, it is to be removed in order to allow an internal examination.</p> <p>Note 5. Particular attention is to be given to the condition of the zinc coating in heads constructed from galvanised steel.</p> <p>Note 6. Exemption may be considered for air pipe heads where there is documented evidence of their replacement within the previous five years.</p>			

5.6.4 Where substantial corrosion is identified and not rectified, this will be subject to examination and thickness measurement at Annual and Intermediate Surveys.

5.6.5 Where considered necessary by the Surveyor, thickness measurements are to be carried out in way of critical areas. These include areas considered prone to rapid wastage.

5.6.6 Where required by LR, a check of the buckling capacity of the upper deck is to be carried out for tankers having a length greater than 90 m.

5.6.7 Steel evaluation of hatch covers on exposed decks and hatch coamings and closing arrangements of cargo holds on ships with contract for construction on or after 1 July 2012 is to be in accordance with IACS UR S21A. Further information is provided in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

5.6.8 Steel renewal is required where the gauged thickness is less than $t_{\text{net}} + 0,5 \text{ mm}$. For definition of t_{net} , see Pt 4, Ch 7, 12.1 General.

5.6.9 Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

■ **Section 6****Special Survey - Bulk carriers - Hull requirements****6.1 General**

6.1.1 The requirements of Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements, Pt 1, Ch 3, 4 Docking Surveys and In-water Surveys - Hull and machinery requirements and Pt 1, Ch 3, 5 Special Survey - General - Hull requirements are to be complied with as applicable.

6.1.2 In order to maintain and/or assign the **ESP** notation, the following requirements apply to the surveys of the hull structure and piping systems in way of the cargo holds, cofferdam, pipe tunnels, void spaces, topside tanks and double bottom tanks in way of the cargo hold area and all salt-water ballast tanks.

6.2 Documentation

6.2.1 The Owner is to obtain, supply and maintain documentation on board as follows:

- (a) A survey file comprising reports of structural surveys, thickness measurement and executive hull summary in accordance with the 2011 ESP Code.
- (b) Supporting documentation consisting of:
 - (i) Main structural plans of cargo holds and ballast tanks (for ships built in accordance with the IACS Common Structural Rules (CSR), these plans are to include for each structural element, both the as-built and the renewal thickness. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for the hold transverse section in all cargo holds).
 - (ii) Previous repair history.
 - (iii) Cargo and ballast history.
 - (iv) Records of inspections by ship's personnel with reference to structural deterioration in general, leakages in bulkheads and piping and the condition of the corrosion prevention systems, if any.
 - (v) Any other information that may help to identify critical structural areas and/or suspect areas requiring inspection.
 - (vi) Survey Programme as required by Pt 1, Ch 3, 6.3 Planning for survey.

The complete documentation in Pt 1, Ch 3, 6.2 Documentation is to be readily available for examination by the Surveyor and should be used as a basis for survey.

6.2.2 The documentation is to be kept on board for the lifetime of the ship.

6.3 Planning for survey

6.3.1 A Survey Programme is to be submitted by the Owner and is to include the proposals for survey, including the means of providing access for Close-up Survey, thickness measurement and tank testing and should take account of the information detailed in Pt 1, Ch 3, 6.2 Documentation.

6.3.2 Prior to the development of the Survey Programme, a Survey Planning Questionnaire is to be completed and submitted by the Owner, see Pt 1, Ch 3, 1.6 Preparation for survey and means of access.

6.4 Overall survey

6.4.1 All cargo holds, salt-water ballast tanks including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull are to be examined, and this examination is to be supplemented by Close-up Survey, thickness measurement and testing as applicable, to ensure that the structural integrity remains effective.

6.4.2 The examination is to be sufficient to ascertain substantial corrosion, significant deformation, fractures, damages or other structural deterioration and, if deemed necessary by the Surveyor, suitable non-destructive examination may be required.

6.4.3 Where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, is identified and is not rectified, this will be subject to re-examination at Annual and Intermediate Surveys.

6.4.4 All piping systems within the tanks and spaces indicated in Pt 1, Ch 3, 6.4 Overall survey are to be examined and tested under working conditions to ensure that the conditions remain satisfactory.

6.4.5 The extent of survey of combined salt-water ballast cargo holds is to be evaluated based on the records of ballast history, the extent and condition of the corrosion protection system provided, and the extent of structural diminution (corrosion).

6.4.6 Where salt-water ballast tanks have been converted to void spaces the survey extent is to be based upon salt-water ballast tank requirements.

6.4.7 Where provided, in association with a corrosion control **CC** special features notation, as defined in the *Register Book*, the condition of the protective coating or corrosion prevention system of cargo holds is to be examined.

6.4.8 For ships fitted with water level detectors in cargo holds, ballast tanks forward of the collision bulkhead and any dry or void space which extends forward of the foremost cargo hold, an examination and a test of the water ingress detection systems and of their alarms is to be carried out.

6.4.9 For ships fitted with a means for draining and pumping ballast tanks forward of the collision bulkhead and the bilges of dry spaces, any part of which extends forward of the foremost cargo hold, an examination and a test of the draining and pumping systems including their controls is to be carried out.

6.5 Testing

6.5.1 The minimum requirements for tank testing, as applicable, are given in Pt 1, Ch 3, 5.3 Examination and testing. Where required, the Surveyor may extend the tank testing if deemed necessary.

6.6 Close-up Survey

6.6.1 The minimum requirements for Close-up Survey are given in Table 3.6.1 Close-up Survey - Single skin bulk carriers, Table 3.6.2 Close-up Survey - Double skin bulk carriers (excluding ore carriers) and Table 3.6.3 Close-up Survey - Ore carriers as applicable.

6.6.2 The Close-up Survey may be extended, as deemed necessary by the Surveyor, after taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

6.6.3 For areas in tanks and cargo holds where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of Close-up Surveys may be specially considered.

Periodical Survey Regulations

Part 1, Chapter 3

Section 6

Table 3.6.1: Close-up Survey - Single skin bulk carriers

Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)	Special Survey IV (Ships 20 years old and over)
<p>(1) 25% of shell frames and their end attachments in the forward cargo hold at representative positions.</p> <p>(2) Selected shell frames and their end attachments in remaining cargo holds.</p> <p>(3) 1 transverse web with associated plating and longitudinals in 2 representative water ballast tanks of each type (i.e. topside or hopper side tank).</p> <p>(4) 2 selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted. This is to include the aft bulkhead of the forward hold.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners).</p>	<p>(1a) For bulk carriers with a deadweight less than 100,000 tonnes, all shell frames in the forward cargo hold and 25% of frames in each of the remaining cargo holds, including their end attachments and adjacent shell plating.</p> <p>(1b) For bulk carriers with a deadweight equal to or greater than 100,000 tonnes, all shell frames in the forward cargo hold and 50% of frames in each of the remaining cargo holds, including their end attachments and adjacent shell plating.</p> <p>(2) 1 transverse web with associated plating and longitudinals in each water ballast tank.</p> <p>(3) Forward and aft transverse bulkhead in 1 side ballast tank, including stiffening system.</p> <p>(4) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted.</p> <p>(5) All cargo hold hatch covers and coamings, (plating and stiffeners).</p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p>	<p>(1) All shell frames in the forward and one other selected cargo hold and 50% of frames in each of the remaining cargo holds, including their end attachments and adjacent shell plating.</p> <p>(2) All transverse webs with associated plating and longitudinals in each water ballast tank.</p> <p>(3) All transverse bulkheads in ballast tanks, including stiffening system.</p> <p>(4) All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners).</p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p>	<p>(1) All shell frames in all cargo holds, including their end attachments and adjacent shell plating.</p> <p>(2) All transverse webs with associated plating and longitudinals in each water ballast tank.</p> <p>(3) All transverse bulkheads in ballast tanks, including stiffening system.</p> <p>(4) All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners).</p> <p>(6) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches.</p>

Note The requirements in this Table apply to all single skin bulk carriers unless stated otherwise.

Note 1. Ballast tank includes peak tanks.

Note 2. Close-up Survey of transverse bulkheads to be carried out at four levels:

Level (a) Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.

Level (b) Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.

Level (c) About mid-height of the bulkhead.

Level (d) Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Periodical Survey Regulations

Section 6

Table 3.6.3: Close-up Survey - Ore carriers

Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)	Special Survey IV (Ships 20 years old and over)
<p>(1) 1 web frame ring complete including adjacent structural members in a water ballast wing tank.</p> <p>(2) 1 transverse bulkhead lower part including girder system and adjacent structural members in a ballast tank.</p> <p>(3) 2 selected cargo hold transverse bulkheads, including internal structure of upper and lower stools where fitted, see Note 2.</p> <p>(4) All cargo hold hatch covers and coamings (plating and stiffeners).</p>	<p>(1) All web frame rings complete including adjacent structural members in a water ballast wing tank.</p> <p>(2) 1 deck transverse including adjacent structural members in each remaining water ballast tank.</p> <p>(3) Forward and aft transverse bulkheads including girder system and adjacent structural members in a ballast wing tank.</p> <p>(4) 1 transverse bulkhead lower part including girder system and adjacent structural members in each remaining ballast tank.</p> <p>(5) 1 transverse bulkhead in each cargo hold, including internal structure of upper and lower stools where fitted, see Note 2.</p> <p>(6) All cargo hold hatch covers and coamings (plating and stiffeners).</p> <p>(7) All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches.</p>	<p>(1) All web frame rings complete including adjacent structural members in each water ballast tank.</p> <p>(2) All transverse bulkheads including girder system and adjacent structural members in each ballast tank.</p> <p>(3) 1 web frame ring complete including adjacent structural members in each wing void space.</p> <p>(4) Additional web frame rings including adjacent structural members in void spaces as deemed necessary by the Surveyor.</p> <p>(5) All cargo hold transverse bulkheads, including internal structure of upper and lower stools where fitted, see Note 2.</p> <p>(6) All cargo hold hatch covers and coamings (plating and stiffeners).</p> <p>(7) All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches</p>	<p>(1) All web frame rings complete including adjacent structural members in each water ballast tank.</p> <p>(2) All transverse bulkheads including girder system and adjacent structural members in each ballast tank.</p> <p>(3) 1 web frame ring complete including adjacent structural members in each wing void space.</p> <p>(4) Additional web frame rings including adjacent structural members in void spaces as deemed necessary by the Surveyor.</p> <p>(5) All cargo hold transverse bulkheads, including internal structure of upper and lower stools where fitted, see Note 2.</p> <p>(6) All cargo hold hatch covers and coamings (plating and stiffeners).</p> <p>(7) All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches.</p>
<p>Note (1) Ballast tank includes peak tanks.</p> <p>Note (2) Close-up Survey of transverse bulkheads to be carried out at four levels:</p> <p>Note Level (a) Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.</p> <p>Note Level (b) Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.</p> <p>Note Level (c) About mid-height of the bulkhead.</p> <p>Note Level (d) Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.</p>			

6.7 Thickness measurement

6.7.1 The minimum requirements for thickness measurements are given in Table 3.6.4 Thickness measurement - Single skin and double skin bulk carriers, see also Pt 1, Ch 3, 5.6 Thickness measurement. For ships built in accordance with the IACS Common Structural Rules (CSR), refer to the LR document *Thickness Measurement and Close-Up Survey Guidance*.

6.7.2 In areas where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, has been noted then additional measurements are to be carried out, as applicable, in accordance with Table 3.6.5 Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion, Table 3.6.6 Thickness measurement - Single skin bulk carriers - Double bottom and hopper structure, with substantial corrosion, Table 3.6.7 Thickness measurement - Single and double skin bulk carriers - Transverse bulkheads in cargo holds, with substantial corrosion, Table 3.6.8 Thickness measurement - Single skin and double skin bulk carriers - Deck structure* with substantial corrosion, Table 3.6.9 Thickness measurement - Double skin bulk

carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion and Table 3.6.10 Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out. For bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the areas identified with substantial corrosion may be either:

- (a) protected by coating applied in accordance with the coating manufacturer's requirements and examined at Annual Surveys to confirm the coating in way is still in GOOD condition, or alternatively;
- (b) subject to thickness measurement at Annual Surveys.

6.7.3 Thickness measurement is required to determine both general and local levels of corrosion in salt water ballast tanks and in the shell frames and their end attachments in all cargo holds. Thickness measurements are also to be carried out to determine the corrosion levels on the transverse bulkhead plating.

6.7.4 Single skin bulk carriers contracted for construction prior to 1 July 1998 are to undergo a re-assessment and evaluation of their cargo hold shell frames in accordance with the Provisional Rules for Existing Ships. The number of shell frames to be measured is equivalent to number of shell frames subject to Close-Up Survey (see Table 3.6.1 Close-up Survey - Single skin bulk carriers), with representative measurements to be taken at specific areas for each frame. The extent of thickness measurement may be specially considered, but not dispensed with in its entirety, by the Surveyor, provided the structural members indicate no thickness diminution with respect to the Rule thickness and the coating is found in 'as-new' condition (i.e. without breakdown or rusting). Repairs to shell frames are to be based upon the minimum thickness values shown in the evaluation records.

6.7.5 For bulk carriers built in accordance with the IACS Common Structural Rules (CSR), the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the Special Surveys carried out after the ship reaches 15 years of age (or during the Special Survey No. 3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship's hull girder for CSR bulk carriers specified in Chapter 13 of CSR. For further details refer to the LR document *Thickness Measurement and Close-Up Survey Guidance*.

6.7.6 Steel renewal evaluation of corrugated transverse watertight bulkheads on bulk carriers of 150 m in length and above, intending to carry solid bulk cargoes having a density of $1,0 \text{ t/m}^3$ with contract for construction on or after 1 July 1998 is to be in accordance with IACS UR S18. These requirements are not applicable to bulk carriers with class notation ESN Hold 1 and ESN – All Holds, or ships built in accordance with the IACS Common Structural Rules (CSR). Further information is provided in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

6.7.7 Steel renewal is required where the gauged thickness is less than $t_{\text{net}} + 0,5 \text{ mm}$. For definition of t_{net} , see Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions.

6.7.8 Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

6.7.9 Hatch covers of cargo holds' steel renewal evaluation of bulk carriers with contract for construction on or after 1 July 1998 is to be in accordance with IACS UR S21. These requirements are not applicable to ships built in accordance with the IACS Common Structural Rules (CSR). Further information is provided in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

6.7.10 Steel renewal is required where the gauged thickness is less than $t_{\text{net}} + 0,5 \text{ mm}$. For definition of t_{net} , see Pt 4, Ch 7, 12.1 General.

6.7.11 Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

6.7.12 Steel renewal evaluation of hatch covers and hatch coamings of cargo holds on bulk carriers and ore carriers with contract for construction on or after 1 January 2004 is to be in accordance with IACS UR S21. These requirements are not applicable to ships built in accordance with the IACS Common Structural Rules (CSR). Further information is provided in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

6.7.13 Steel renewal is required where the gauged thickness is less than $t_{\text{net}} + 0,5 \text{ mm}$. For definition of t_{net} , see Pt 4, Ch 7, 12.1 General.

6.7.14 Where the gauged thickness is within the range $t_{\text{net}} + 0,5 \text{ mm}$ and $t_{\text{net}} + 1,0 \text{ mm}$, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

Section 6

Table 3.6.4: Thickness measurement - Single skin and double skin bulk carriers

Special Survey I (Ships 5 years old)	Special Survey III (Ships 15 years old)	Special Survey IV and subsequent (Ships 20 years old and over)
<p>(1) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey in accordance with Table 3.6.1 Close-up Survey - Single skin bulk carriers, Table 3.6.2 Close-up Survey - Double skin bulk carriers (excluding ore carriers) or Table 3.6.3 Close-up Survey - Ore carriers.</p> <p>(2) Critical areas, as required by the Surveyor.</p>	<p>(1) Within the cargo length area:</p> <p>(a) Each deck plate outside line of cargo hatch openings.</p> <p>(b) 2 transverse sections, outside line of cargo hatch openings. (A minimum of 1 of the above transverse sections is to be within 0,5L amidships).</p>	<p>(1) Within the cargo length area:</p> <p>(a) Each deck plate outside line of cargo hatch openings.</p> <p>(b) 3 transverse sections, outside line of cargo hatch openings. (A minimum of 2 of the above transverse sections is to be within 0,5L amidships).</p> <p>(c) Each bottom plate.</p>
Special Survey II (Ships 10 years old)	<p>(2) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey in accordance with Table 3.6.1 Close-up Survey - Single skin bulk carriers, Table 3.6.2 Close-up Survey - Double skin bulk carriers (excluding ore carriers) or Table 3.6.3 Close-up Survey - Ore carriers.</p>	<p>(2) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey in accordance with Table 3.6.1 Close-up Survey - Single skin bulk carriers, Table 3.6.2 Close-up Survey - Double skin bulk carriers (excluding ore carriers) or Table 3.6.3 Close-up Survey - Ore carriers.</p>
<p>(1) Within the cargo length area:</p> <p>(a) 2 sections of deck plating outside line of cargo hatch openings.</p> <p>(2) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey in accordance with Table 3.6.1 Close-up Survey - Single skin bulk carriers, Table 3.6.2 Close-up Survey - Double skin bulk carriers (excluding ore carriers) or Table 3.6.3 Close-up Survey - Ore carriers.</p>	<p>(3) All wind and water strakes within the cargo length area.</p> <p>(4) Selected wind and water strakes outside the cargo length area.</p> <p>(5) All cargo hatch covers and coamings (plating and stiffeners).</p> <p>(6) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 1 and 3.</p>	<p>(3) All wind and water strakes over the full length of the ship, port and starboard.</p> <p>(4) All cargo hatch covers and coamings (plating and stiffeners).</p> <p>(5) Remaining exposed main deck plates not considered in item (1) and representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck).</p> <p>(6) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 1 and 3.</p> <p>(7) All keel plates outside the cargo length area. Also additional bottom plates in way of cofferdams. Machinery space and aft end of tanks.</p>
<p>(3) Wind and water strakes in way of the transverse sections considered in item (1).</p> <p>(4) Selected wind and water strakes outside the cargo length area.</p> <p>(5) Cargo hold shell frames on single skin ships, see Note 5.</p> <p>(6) Critical areas, as required by the Surveyor.</p>	<p>(7) The aft bulkhead of the forward cargo hold, see Note 4.</p> <p>(8) Cargo hold shell frames on single skin ships, see Note 5.</p> <p>(9) Critical areas, as required by the Surveyor.</p>	<p>(8) Plating of seachests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor.</p> <p>(9) The aft bulkhead of the forward cargo hold on single skin ships, see Note 4.</p> <p>(10) Cargo hold shell frames on single skin ships, see Note 5.</p> <p>(11) Critical areas, as required by the Surveyor.</p>
<p>Note The requirements in this table apply to both single skin and double skin ships unless stated otherwise.</p>		

Periodical Survey Regulations

Part 1, Chapter 3

Section 6

Note 1. For areas in spaces where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of thickness measurement may be specially considered, but not dispensed with in its entirety. Prior to any coating or recoating of cargo holds, scantlings are to be confirmed by thickness measurement with the Surveyor in attendance.

Note 2. Transverse sections should be chosen where the largest reductions are likely to occur, or as revealed by deck plating measurement.

Note 3. Transverse bulkhead complete including stiffening system.

Note 4. For ships assigned the notations **ESN Hold No1** and **ESN All Holds**, the corrugated part of the aft transverse bulkhead of the forward cargo hold is to be subject to thickness measurement. This is to include each vertical corrugation at its lower and middle level including shedder plates and gusset plates, where applicable.

Note 5. Single skin bulk carriers contracted for construction prior to 1 July 1998 are to undergo a re-assessment of their cargo hold shell frames in accordance with the Provisional Rules for Existing Ships. The number of shell frames to be measured is equivalent to the number of shell frames subject to Close-up survey (see Table 3.6.1 Close-up Survey - Single skin bulk carriers), with representative measurements to be taken at specific areas for each frame.

Table 3.6.5: Thickness measurement - Single skin bulk carriers - Shell plating and stiffening, with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Bottom and side shell plating	Suspect plate plus four adjacent plates	5 point pattern for each panel between longitudinals
(2) Bottom/side shell longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurements in line across web and 3 measurements on flange
(3) Side shell frames	Suspect frame and each adjacent	At each end and mid-span: (a) 5 point pattern on both web and flange (b) 5 point pattern within 25 mm of welded attachment to both side shell and hopper sloping plate

Table 3.6.6: Thickness measurement - Single skin bulk carriers - Double bottom and hopper structure, with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Inner bottom plating	Suspect plate plus all immediately adjacent plates	5 point pattern for each panel between longitudinals over 1 m length
(2) Inner bottom longitudinals	Three longitudinals in way of plates measured	3 measurements in line across web and 3 measurements on flange
(3) Transverse floors and longitudinal girders	Suspect plates	5 point pattern over approximately 1 m ² of plating
(4) Watertight floors and girders	(a) lower 1/3 of tank (b) upper 2/3 of tank	(a) 5 point pattern over 1 m ² of plating (b) 5 point pattern alternate plates over 1 m ² of plating
(5) Transverse web frames	Suspect plate	5 point pattern over 1 m ² of plating

Section 6

Table 3.6.7: Thickness measurement - Single and double skin bulk carriers - Transverse bulkheads in cargo holds, with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Lower stool	(a) Transverse band within 25 mm of welded connection to inner-bottom (b) Transverse band within 25 mm of welded connection to shelf plate	(a) 5 point pattern between stiffeners over 1 m length (b) as above
(2) Transverse bulkhead	(a) Transverse band immediately above lower stool shelf plate (b) Transverse band at approximately mid-height (c) Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	(a) 5 point pattern over 1 m length (b) 5 point pattern over 1 m ² of plating (c) 5 point pattern over 1 m ² of plating

Table 3.6.8: Thickness measurement - Single skin and double skin bulk carriers - Deck structure* with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Cross deck plating	Suspect cross deck strip plating	5 point pattern between underdeck stiffeners over 1 m length
(2) Underdeck stiffeners	(a) Transverse members (b) Longitudinal member	(a) 5 point pattern at each end and mid-span (b) 5 point pattern on both web and flange
(3) Hatch covers	(a) Each side and end plate 3 locations (b) Hatch cover top plate, 3 longitudinal bands - 2 on outboard strakes and 1 on centreline strake	(a) 5 point pattern at each location (b) 5 point measurement at each band
(4) Hatch coamings	Each side and end of coaming, one upper and one lower band	5 point measurement at each band
(5) Topside salt water ballast tanks	(a) Watertight transverse bulkheads (i) lower 1/3 of bulkhead (ii) upper 2/3 of bulkhead (iii) stiffeners (b) Swash transverse bulkheads (i) lower 1/3 of bulkhead (ii) upper 2/3 of bulkhead (iii) stiffeners (c) 3 representative bays of the topside sloping plate (i) lower 1/3 of tank (ii) upper 2/3 of tank	(i) 5 point pattern over 1 m ² of plating (ii) 5 point pattern over 1 m ² of plating (iii) 5 point pattern over 1 m length (i) 5 point pattern over 1 m ² of plating (ii) 5 point pattern over 1 m ² of plating (iii) 5 point pattern over 1 m length (i) 5 point pattern over 1 m ² of plating (ii) 5 point pattern over 1 m ² of plating

Periodical Survey Regulations

Part 1, Chapter 3

Section 6

	(d) suspect longitudinals and adjacent plates	5 point pattern both web and flange over 1 m length
(6) Main deck plating	Suspect plates and 4 immediately adjacent plates	5 point pattern over 1m ² of plating
(7) Main deck longitudinals	Minimum of 3 longitudinals where plating measured	5 point pattern on both web and flange over 1 m length
(8) Web frames/transverses	Suspect plates	5 point pattern over 1m ² of plating
* including cross strips, main cargo hatchways, hatch covers, coamings and topside tanks		

Table 3.6.9: Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Bottom, inner bottom and hopper structure plating	(a) Minimum of 3 bays across double bottom tank, including aft bay (b) Measurements around and under all suction bell mouths	5 point pattern for each panel between longitudinals and floors
(2) Bottom, inner bottom and hopper structure longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on the vertical web
(3) Bottom girders, including watertight girders	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements
(4) Bottom floors, including watertight floors	3 floors in the bays where bottom plating measured, with measurements at both ends and middle	5 point pattern over 2 m ² area
(5) Hopper structure web frame ring	3 floors in bays where bottom plating measured	5 point pattern over 1 m ² of plating and single measurements on flange
(6) Hopper structure transverse watertight bulkhead or swash bulkhead	(a) lower 1/3 of bulkhead (b) upper 2/3 of bulkhead (c) stiffeners (minimum of 3)	(a) 5 point pattern over 1 m ² of plating (b) 5 point pattern over 2 m ² of plating (c) For web, 5 point pattern over span (2 measurements across web at each end and 1 at centre of span). For flange, single measurements at each end and centre of span
(7) Panel stiffening	Where applicable	Single measurements

Table 3.6.10: Thickness measurement - Double skin bulk carriers - Double side space structure (including wing void spaces of ore carriers), with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Side shell and inner plating:	(i) Plating between each pair of transverse frames/longitudinals in a minimum of 3 bays along the tank	(i) Single measurement
(i) Upper strake and strakes in way of horizontal girders		(ii) Single measurement
(ii) All other strakes	(ii) Plating between every third pair of longitudinals in same 3 bays	

Periodical Survey Regulations

Part 1, Chapter 3

Section 7

(2) Side shell and inner side transverse frames/longitudinals on:	(i) Each transverse frame/longitudinal in same 3 bays	(i) 3 measurements across web and 1 measurement on flange
(i) Upper strake	(ii) Every third transverse frame/ longitudinal in same 3 bays	(ii) 3 measurements across web and 1 measurement on flange
(ii) All other strakes		
(3) Transverse frames/longitudinals - brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
(4) Vertical web and transverse bulkheads:	(i) Minimum of 2 webs and both transverse bulkheads	(i) 5 point pattern over approx. 2 m ² area
(i) Strakes in way of horizontal girders	(ii) Minimum of 2 webs and both transverse bulkheads	(ii) 2 measurements between each pair of vertical stiffeners
(ii) Other strakes		
(5) Horizontal girders	Plating on each girder in a minimum of 3 bays	2 measurements between each pair of longitudinal girder stiffeners
(6) Panel stiffening	Where applicable	Single measurements

Section 7

Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements

7.1 General

7.1.1 The requirements of Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements, Pt 1, Ch 3, 4 Docking Surveys and In-water Surveys - Hull and machinery requirements and Pt 1, Ch 3, 5 Special Survey - General - Hull requirements are to be complied with as applicable.

7.1.2 In order to maintain and/or assign the **ESP** notation, the following requirements apply to the surveys of the hull structure and piping systems in way of the cargo tanks/cargo holds, pump rooms, cofferdam, pipe tunnels, void spaces, double bottom tanks, etc. in way of the cargo tank area and all salt-water ballast tanks.

7.2 Documentation

7.2.1 The Owner is to obtain, supply and maintain documentation on board as follows:

- (a) A survey file comprising reports of structural surveys, thickness measurement and executive hull summary in accordance with the 2011 ESP Code.
- (b) Supporting documentation consisting of:
 - (i) Main structural plans of cargo tanks/cargo holds and ballast tanks (for ships built in accordance with IACS Common Structural Rules (CSR), these plans are to include for each structural element, both the as-built and the renewal thickness. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for the tank transverse section in all cargo tanks).
 - (ii) Previous repair history.
 - (iii) Cargo and ballast history.
 - (iv) Records of inspections by ship's personnel with reference to structural deterioration in general, leakages in bulkheads and piping and the condition of the corrosion prevention systems, if any.
 - (v) Extent of use of inert gas plant and tank cleaning procedures.
 - (vi) Any other information that may help to identify critical structural areas and/or suspect areas requiring inspection.
 - (vii) Survey Programme as required by Pt 1, Ch 3, 7.3 Planning for survey.

The complete documentation in Pt 1, Ch 3, 7.2 Documentation is to be readily available for examination by the Surveyor and should be used as a basis for survey.

7.2.2 The documentation is to be kept on board for the lifetime of the ship.

7.3 Planning for survey

7.3.1 A Survey Programme is to be submitted by the Owner and is to include the proposals for survey, including the means of providing access for Close-up Survey, thickness measurement and tank testing and should take account of the information detailed in Pt 1, Ch 3, 7.2 Documentation.

7.3.2 Prior to the development of the Survey Programme a Survey Planning Questionnaire is to be completed and submitted by the Owner, see Pt 1, Ch 3, 1.6 Preparation for survey and means of access.

7.4 Overall Survey

7.4.1 All cargo tanks/cargo holds, and salt-water ballast tanks including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks/cargo holds, deck and outer hull are to be examined, and this examination is to be supplemented by Close-up Survey, thickness measurement and testing as applicable, to ensure that the structural integrity remains effective.

7.4.2 The examination is to be sufficient to ascertain substantial corrosion, significant deformation, fractures, damages or other structural deterioration and, if deemed necessary by the Surveyor, suitable non-destructive examination may be required.

7.4.3 Where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, is identified and is not rectified, this will be subject to re-examination at Annual and/or Intermediate Surveys. In the case of salt-water ballast tanks and combined tanks for the carriage of salt-water ballast and cargo oil, the examination will be required at Annual Survey and Intermediate Survey. In the case of cargo oil tanks the examination will be required at Intermediate Surveys.

7.4.4 All cargo piping on deck, including Crude Oil Washing (COW) piping, and cargo and ballast piping within those spaces indicated in Pt 1, Ch 3, 7.4 Overall Survey are to be examined and tested under working conditions to ensure that tightness and condition remain satisfactory. Special attention is to be given to ballast piping in cargo tanks and any cargo piping in ballast tanks and void spaces.

7.4.5 Where salt-water ballast tanks have been converted to void spaces the survey extent is to be based upon salt-water ballast tank requirements.

7.4.6 Where provided, in association with a corrosion control **CC** special features notation, as defined in the *Register Book*, the condition of the protective coating or corrosion prevention system of cargo tanks is to be examined.

7.4.7 The attachment to the structure and condition of anodes in tanks is to be examined.

7.4.8 Where fitted, the strums of the cargo suction pipes are to be removed or lifted to facilitate examination of the shell plating and bulkheads in the vicinity, unless other means for visual inspection of these parts are provided.

7.5 Testing

7.5.1 The minimum ballast tank testing requirements are given in Table 3.7.1 Tank testing requirements - Single hull and double hull oil tankers, ore/oil ships and ore/bulk/oil ships and, where required, the Surveyor may extend the tank testing if deemed necessary. The remaining requirements for tank testing, as applicable, are given in Pt 1, Ch 3, 5.3 Examination and testing.

7.5.2 The minimum cargo tank testing requirements are given in Table 3.7.1; boundaries of cargo tanks are to be tested to the highest point that liquid will rise to under service conditions.

Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor provided the following conditions are complied with:

- (a) A tank testing procedure has been submitted by the Owner and reviewed by LR prior to the testing being carried out.
- (b) There is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank.
- (c) The tank testing has been satisfactorily carried out within the special survey window not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed.
- (d) The satisfactory results of the testing are recorded in the ship's logbook.
- (e) The internal and external condition of the tanks and associated structure is found satisfactory by the Surveyor at the time of the overall and close-up survey.

Table 3.7.5: Close-up Survey - Ore/bulk/oil ships

Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)	Special Survey IV (Ships 20 years old and over)
(1) 25% of shell frames and their end attachments in the forward cargo hold at representative positions (2) Selected frames and their end attachments in remaining cargo holds (3) 1 transverse web with associated plating and longitudinals in 2 representative water ballast tanks of each (i.e. topside, hopper side or side tank) (4) 2 selected cargo hold transverse bulkheads including internal structure of upper and lower stools where fitted. This is to include the aft bulkhead in the forward cargo hold	(1) 25% of shell frames including their end attachments and adjacent shell plating in all cargo holds (2) 1 transverse web with associated plating and longitudinals in each water ballast tank (i.e. topside, hopper side or side tank) (3) Forward and aft transverse bulkhead in 1 side ballast tank, including stiffening system (4) 1 transverse bulkhead in each cargo hold including internal structure of upper and lower stools where fitted. This is to include the aft bulkhead in the forward cargo hold (5) Selected cargo hold hatch covers and coamings (plating and stiffeners) (6) Selected areas of deck plating inside line of hatch openings between cargo hold hatches	(1) All shell frames in the forward cargo hold and 25% of frames in remaining cargo holds, including their end attachments and adjacent shell plating (2) All transverse webs with associated plating and longitudinals in each water ballast tank (i.e. topside, hopper side or side tank) (3) All transverse bulkheads in ballast tanks, including stiffening system (4) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted (5) All cargo hold hatch covers and coamings (plating and stiffeners) (6) All deck plating inside line of hatch openings between cargo hold hatches	(1) All shell frames including their end attachments and adjacent shell plating in all cargo holds (2) All transverse webs with associated plating and longitudinals in each water ballast tank (i.e. topside, hopper side or side tank) (3) All transverse bulkheads in ballast tanks, including stiffening system (4) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted (5) All cargo hold hatch covers and coamings (plating and stiffeners) (6) All deck plating inside line of hatch openings between cargo hold hatches
<p>Note 1. Ballast tank includes peak tanks.</p> <p>Note 2. Close-up Survey of transverse bulkheads to be carried out at four levels:</p> <p>Note Level (a) Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.</p> <p>Note Level (b) Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools), and immediately above the line of the shedder plates.</p> <p>Note Level (c) About mid-height of the bulkhead.</p> <p>Note Level (d) Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.</p>			

7.6.2 The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system, and the following:

- (a) Structural arrangements or details which have suffered defects in similar spaces or on similar ships.
- (b) Spaces which have structures approved with reduced scantlings in association with an approved corrosion control system.

7.6.3 For areas in tanks where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of Close-up Surveys may be specially considered.

Periodical Survey Regulations

Part 1, Chapter 3

Section 7

7.7 Thickness measurement

7.7.1 The minimum requirements for thickness measurements are given in Table 3.7.6 Thickness measurement - Single hull and double hull oil tankers, ore/oil ships and ore/bulk/oil ships (Single and double hull oil tankers, including ore/oil ships and ore/bulk/oil ships), see also Pt 1, Ch 3, 5.6 Thickness measurement. For ships built in accordance with the IACS Common Structural Rules (CSR), refer to the LR document *Thickness Measurement and Close-Up Survey Guidance*.

Table 3.7.6: Thickness measurement - Single hull and double hull oil tankers, ore/oil ships and ore/bulk/oil ships

Special Survey I (Ships 5 years old)	Special Survey III (Ships 15 years old)	Special Survey IV (Ships 20 years old and over)
<p>(1) 1 section of deck plating for the full beam of the ship within 0.5L amidships in way of a ballast tank, if any, or a cargo tank used primarily for water ballast.</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.7.2 Close-up Survey - Single hull oil tankers, Table 3.7.3 Close-up Survey - Double hull oil tankers, Table 3.7.4 Close-up Survey - Ore/oil ships or Table 3.7.5 Close-up Survey - Ore/bulk/oil ships.</p> <p>(3) Critical areas, as required by the Surveyor.</p>	<p>(1) Within the cargo area.</p> <p>(a) Each deck plate.</p> <p>(b) 2 transverse sections, see Note 6.</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.7.2 Close-up Survey - Single hull oil tankers, Table 3.7.3 Close-up Survey - Double hull oil tankers, Table 3.7.4 Close-up Survey - Ore/oil ships or Table 3.7.5 Close-up Survey - Ore/bulk/oil ships.</p>	<p>(1) Within the cargo area:</p> <p>(a) Each deck plate.</p> <p>(b) 3 transverse sections, see Note 6.</p> <p>(c) Each bottom plate.</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.7.2 Close-up Survey - Single hull oil tankers, Table 3.7.3 Close-up Survey - Double hull oil tankers, Table 3.7.4 Close-up Survey - Ore/oil ships or Table 3.7.5 Close-up Survey - Ore/bulk/oil ships.</p>
<p>Special Survey II (Ships 10 years old)</p>	<p>(3) Selected wind and water strakes outside the cargo area.</p>	<p>(3) All wind and water strakes over the full length of the ship, port and starboard.</p>
<p>(1) Within the cargo tank area:</p> <p>(a) Each deck plate.</p> <p>(b) 1 transverse section, see Note 6.</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.7.2 Close-up Survey - Single hull oil tankers, Table 3.7.3 Close-up Survey - Double hull oil tankers, Table 3.7.4 Close-up Survey - Ore/oil ships or Table 3.7.5 Close-up Survey - Ore/bulk/oil ships.</p> <p>(3) Selected wind and water strakes outside the cargo area.</p> <p>(4) Critical areas, as required by the Surveyor.</p>	<p>(4) All wind and water strakes within the cargo area.</p> <p>(5) All cargo hold hatch covers and coamings (plating and stiffeners), see Note 5.</p> <p>(6) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 1 and 4</p> <p>(7) Critical areas, as required by the Surveyor.</p>	<p>(4) All cargo hold hatch covers and coamings (plating and stiffeners), see Note 5.</p> <p>(5) Remaining exposed main deck plating not considered in item (1) and representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck).</p> <p>(6) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 1 and 4.</p> <p>(7) All keel plates outside the cargo tank length. Also additional bottom plates in way of cofferdams, Machinery space and aft end of tanks.</p> <p>(8) Plating of seachests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor.</p> <p>(9) Critical areas, as required by the Surveyor.</p>
<p>Note 1. For areas in tanks where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of thickness measurements may be specially considered, but not dispensed with in its entirety.</p> <p>Note 2. Transverse sections should be chosen where the largest reductions are likely to occur, or as revealed by deck plating measurement.</p> <p>Note 3. Where two or three transverse sections are required to be measured, at least one is to include a ballast tank within 0,5L amidships.</p>		

Periodical Survey Regulations

Part 1, Chapter 3

Section 7

Note 4. Transverse bulkhead complete including stiffening system.

Note 5. All cargo hold hatch covers and coamings, where fitted, are to be measured on ore/oil and ore/bulk/oil ships.

Note 6. For oil tankers (including ore/oil and ore/bulk/oil ships), with length ≥ 130 m and over 10 years of age, the longitudinal strength is to be evaluated. In such cases, a minimum of three transverse sections are to be measured within 0,5L amidships.

7.7.2 In areas where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, has been noted then additional measurements are to be carried out, as applicable, in accordance with Table 3.7.7 Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Bottom structure with substantial corrosion, Table 3.7.8 Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Deck structure with substantial corrosion, Table 3.7.9 Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Shell and longitudinal bulkheads with substantial corrosion, Table 3.7.9 Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Shell and longitudinal bulkheads with substantial corrosion, Table 3.7.11 Thickness measurement - Double hull oil tankers - Bottom, inner bottom and hopper structure with substantial corrosion, Table 3.7.12 Thickness measurement - Double hull oil tankers - Deck structure with substantial corrosion, Table 3.7.13 Thickness measurement - Double hull oil tankers - Wing ballast tank structure with substantial corrosion, Table 3.7.14 Thickness measurement - Double hull oil tankers - Longitudinal bulkhead structure in cargo tanks with substantial corrosion and Table 3.7.15 Thickness measurement - Double hull oil tankers - Transverse watertight and swash bulkhead structure in cargo tanks with substantial corrosion to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out. For double hull oil tankers built in accordance with the IACS Common Structural Rules (CSR), the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out at Annual and Intermediate Surveys.

7.7.3 For **oil tankers** (including ore/oil and ore/bulk/oil ships) of 130 m in length and upwards (as defined by the *International Convention on Load Lines* in force), the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced as appropriate, during the Special Surveys carried out after the ship reaches 10 years of age.

7.7.4 Steel renewal evaluation of hatch covers and hatch coamings of cargo holds on combination carriers with contract for construction on or after 1 January 2004 is to be in accordance with IACS UR S21. These requirements are not applicable to ships built in accordance with the IACS Common Structural Rules (CSR). Further information is provided in the LR document *Thickness Measurement and Close-Up Survey Guidance*.

7.7.5 Steel renewal is required where the gauged thickness is less than $t_{\text{net}} + 0,5$ mm. For definition of t_{net} , see Pt 4, Ch 7, 12.1 General.

7.7.6 Where the gauged thickness is within the range $t_{\text{net}} + 0,5$ mm and $t_{\text{net}} + 1,0$ mm, a coating (applied in accordance with coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal.

Table 3.7.7: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Bottom structure with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Bottom plating	Minimum of 3 bays across tank, including aft bay Measurement around and under all suction strums	5 point pattern for each panel between longitudinals and webs
(2) Bottom longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertical web
(3) Bottom girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across face flat. 5 point pattern on girder/bulkhead brackets

Periodical Survey Regulations

Part 1, Chapter 3

Section 7

(4) Bottom transverse webs	3 webs in bays where bottom plating measured, with measurements at middle and both ends	5 point pattern over 2 m ² area. Single measurements on face flat
(5) Panel stiffening	Where applicable	Single measurements

Table 3.7.8: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Deck structure with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Deck plating	2 bands across tank	Minimum of 3 measurements per plate per band
(2) Deck longitudinals	Minimum of 3 longitudinals in each of 2 bays	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
(3) Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across face flat. 5 point pattern on girder/bulkhead brackets
(4) Deck transverse webs	Minimum of 2 webs with measurement at both ends and middle of span	5 point pattern over 2 m ² area. Single measurements on face flat
(5) Panel stiffening	Where applicable	Single measurements

Table 3.7.9: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Shell and longitudinal bulkheads with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Deckhead and bottom strakes and strakes in way of stringer platforms	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
(2) All other strakes	Plating between every 3rd pair of longitudinals in same 3 bays	Single measurement
(3) Longitudinals – deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
(4) Longitudinals – all others	Every third longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
(5) Longitudinals – bracket	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
(6) Web frames and cross ties	3 webs with minimum of 3 locations on each web, including in way of cross tie connections	5 point pattern over 2 m ² area, plus single measurements on web frame and cross tie face flats

Table 3.7.10: Thickness measurement - Single hull oil tankers, ore/oil ships and ore/bulk/oil ships - Transverse bulkheads and swash bulkheads with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Deckhead and bottom strakes in way of stringer platforms	Plating between pair of stiffeners at 3 locations: approx. 1/4, 1/2 and 3/4 width of tank	5 point pattern between stiffeners over 1 m length

Periodical Survey Regulations

Part 1, Chapter 3

Section 7

(2) All other strakes	Plating between pair of stiffeners at middle location	Single measurement
(3) Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange or fabricated connection	5 point pattern over 1 m ² of plating
(4) Stiffeners	Minimum of 3 typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
(5) Brackets	Minimum of 3 at top, middle and bottom of tank	5 point pattern over area of bracket
(6) Deep webs and girders	Measurements at toe of bracket and at centre of span	For web, 5 point pattern over 1 m ² area. 3 measurements across face flat
(7) Stringer platforms	All stringers with measurements at middle and both ends	5 point pattern over 1 m ² area plus single measurements near bracket toes and on face flats

Table 3.7.11: Thickness measurement - Double hull oil tankers - Bottom, inner bottom and hopper structure with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Bottom, inner bottom and hopper plating	Minimum of 3 bays across double bottom tank, including aft bay. Measurement around and under all suction strums	5 point pattern for each panel between longitudinals and floors
(2) Bottom, inner bottom and hopper longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertical web
(3) Bottom girders, including watertight girders	At the fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements
(4) Bottom floors, including watertight floors	3 floors in bays where bottom plating measured, with measurements at both ends and middle	5 point pattern over 2 m ² area
(5) Hopper web frame ring	3 floors in bays where bottom plating measured	5 point pattern over 1 m ² of plating. Single measurements on flange
(6) Hopper transverse watertight bulkhead or swash bulkhead	<i>(i)</i> Lower $\frac{1}{3}$ of bulkhead <i>(ii)</i> Upper $\frac{2}{3}$ of bulkhead <i>(iii)</i> Stiffeners (minimum of 3)	<i>(i)</i> 5 point pattern over 1 m ² of plating. <i>(ii)</i> 5 point pattern over 2 m ² of plating. <i>(iii)</i> For web, 5 point pattern over span (2 measurements across web at each end and 1 at centre of span). For flange, single measurement at each end and centre of span.
(7) Panel stiffening	Where applicable	Single measurements

Periodical Survey Regulations

Part 1, Chapter 3

Section 7

Table 3.7.12: Thickness measurement - Double hull oil tankers - Deck structure with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Deck plating	2 transverse bands across tank	Minimum of 3 measurements per plate per band
(2) Deck longitudinals	Every 3rd longitudinal in each of 2 bands with a minimum of 1 longitudinal	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
(3) Deck girders and brackets (usually in cargo tanks only)	At the fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across flange. 5 point pattern on girder / bulkhead brackets
(4) Deck transverse webs	Minimum of 2 webs, with measurements at both ends and middle of span	5 point pattern over 1 m ² area. Single measurements on the flange
(5) Vertical web and transverse bulkhead in wing ballast tank (two metres from deck)	Minimum of 2 webs, and both transverse bulkheads	5 point pattern over 1 m ² area
(6) Panel stiffening	Where applicable	Single measurements

Table 3.7.13: Thickness measurement - Double hull oil tankers - Wing ballast tank structure with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Side shell and longitudinal bulkhead plating:	(i) Plating between each pair of longitudinals in a minimum of 3 bays (along the tank)	(i) Single measurements
(i) Upper strake and strakes in way of horizontal girders	(ii) Plating between every 3rd pair of longitudinals on same 3 bays	(ii) Single measurements
(ii) All other strakes		
(2) Side shell and longitudinal bulkhead longitudinals on:	(i) Each longitudinal in same 3 bays	(i) 3 measurements across web and 1 measurement on flange
(i) Upper strake	(ii) Every 3rd longitudinal in same 3 bays	(ii) 3 measurements across web and 1 measurement on flange
(ii) All other strakes		
(3) Longitudinals – brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
(4) Vertical web and transverse bulkheads (excluding deckhead area):	(i) Minimum of 2 webs and both transverse bulkheads	(i) 5 point pattern over approximately 2 m ² area
(i) Strakes in way of horizontal girders	(ii) Minimum of 2 webs and both transverse bulkheads	(ii) 2 measurements between each pair of vertical stiffeners
(ii) Other strakes		
(5) Horizontal girders	Plating on each girder in a minimum of 3 bays	2 measurements between each pair of longitudinal girder stiffeners
(6) Panel stiffening	Where applicable	Single measurements

Periodical Survey Regulations

Structural member	Extent of measurement	Pattern of measurement
(1) Deckhead and bottom strakes, and strakes in way of horizontal stringers on transverse bulkheads	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
(2) All other strakes	Plating between every 3rd pair of longitudinals in same 3 bays	Single measurement
(3) Longitudinals on deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurements on flange
(4) All other longitudinals	Every 3rd longitudinal in same 3 bays	3 measurements across web and 1 measurements on flange
(5) Longitudinals – brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
(6) Web frames and cross ties	3 webs with minimum of 3 locations on each web, including in way of cross tie connections	5 point pattern over approximately 2 m ² area of webs, plus single measurements on flanges of web frames and cross ties
(7) Lower end brackets (opposite side of web frame)	Minimum of 3 brackets	5 point pattern over approximately 2 m ² area of brackets, plus single measurements on bracket flanges

Table 3.7.15: Thickness measurement - Double hull oil tankers - Transverse watertight and swash bulkhead structure in cargo tanks with substantial corrosion

Structural member	Extent of measurement	Pattern of measurements
(1) Upper and lower stool, where fitted	Transverse band within 25 mm of welded connection to inner bottom/deck plating Transverse band within 25 mm of welded connection to shelf plate	5 point pattern between stiffeners over 1 m length
(2) Deckhead and bottom strakes, and strakes in way of horizontal stringers	Plating between pair of stiffeners at 3 locations; approximately ¼, ½ and ¾ width of tank.	5 point pattern between stiffeners over 1 m length
(3) All other strakes	Plating between pair of stiffeners at middle location	Single measurement
(4) Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5 point pattern over approximately 1 m ² of plating
(5) Stiffeners	Minimum of 3 typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and 1 at centre of span). For flange, single measurement at bracket toe and at centre of span
(6) Brackets	Minimum of 3 at top, middle and bottom of tank	5 point pattern over area of bracket
(7) Horizontal stringers	All stringers with measurements at both ends and middle	5 point pattern over 1 m ² area, plus single measurements near bracket toes and on flanges

■ Section 8**Special Survey - Chemical Tankers - Hull requirements****8.1 General**

8.1.1 The requirements of Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements, Pt 1, Ch 3, 4 Docking Surveys and In-water Surveys - Hull and machinery requirements and Pt 1, Ch 3, 5 Special Survey - General - Hull requirements are to be complied with as applicable.

8.1.2 In order to maintain and/or assign the **ESP** notation, the following requirements apply to the surveys of the hull structure and piping systems in way of the cargo tanks, pump rooms, cofferdam, pipe tunnels, void spaces, double bottom tanks, etc. in way of the cargo tank area and all salt-water ballast tanks.

8.2 Documentation

8.2.1 The Owner is to obtain, supply and maintain documentation on board as follows:

- (a) A survey file comprising reports of structural surveys, thickness measurement and executive hull summary in accordance with the 2011 ESP Code.
- (b) Supporting documentation consisting of:
 - (i) Main structural plans of cargo tanks and ballast tanks.
 - (ii) Previous repair history.
 - (iii) Cargo and ballast history.
 - (iv) Records of inspections by ship's personnel with reference to structural deterioration in general, leakages in bulkheads and piping and the condition of the corrosion prevention systems, if any.
 - (v) Extent of use of inert gas plant and tank cleaning procedures.
 - (vi) Any other information that may help to identify critical structural areas and/or suspect areas requiring inspection.
 - (vii) Survey Programme as required by Pt 1, Ch 3, 8.3 Planning for survey.

The complete documentation in Pt 1, Ch 3, 8.2 Documentation is to be readily available for examination by the Surveyor and should be used as a basis for survey.

8.2.2 The documentation is to be kept on board for the lifetime of the ship.

8.3 Planning for survey

8.3.1 A Survey Programme is to be submitted by the Owner and is to include the proposals for survey, including the means of providing access for Close-up Survey, thickness measurement, tank testing and should take account of the information detailed in Pt 1, Ch 3, 8.2 Documentation.

8.3.2 Prior to the development of the Survey Programme a Survey Planning Questionnaire is to be completed and submitted by the Owner, see Pt 1, Ch 3, 1.6 Preparation for survey and means of access.

8.4 Overall Survey

8.4.1 All cargo tanks and salt-water ballast tanks including double bottom tanks, pump rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, deck and outer hull are to be examined, and this examination is to be supplemented by Close-up Survey, thickness measurement and testing as applicable, to ensure that the structural integrity remains effective.

8.4.2 The examination is to be sufficient to ascertain substantial corrosion, significant deformation, fractures, damages or other structural deterioration and, if deemed necessary by the Surveyor, suitable non-destructive examination may be required.

8.4.3 Where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, is identified and is not rectified, this will be subject to re-examination at Annual and/or Intermediate Surveys. In the case of salt-water ballast tanks the examination will be required at Annual Survey and Intermediate Survey. In the case of cargo tanks the examination will be required at Intermediate Surveys.

8.4.4 All cargo piping on deck, and cargo and ballast piping, within those spaces indicated in Pt 1, Ch 3, 8.4 Overall Survey are to be examined and tested under working conditions to ensure that tightness and condition remain satisfactory. Special attention is to be given to ballast piping in cargo tanks and any cargo piping in ballast tanks and void spaces.

Periodical Survey Regulations

Part 1, Chapter 3

Section 8

8.4.5 The survey of stainless steel tanks may be carried out as an Overall Survey supplemented by Close-up Survey as deemed necessary by the Surveyor.

8.4.6 Where salt-water ballast tanks have been converted to void spaces the survey extent is to be based upon salt-water ballast tank requirements.

8.4.7 Where provided, in association with a corrosion control **CC** special features notation, as defined in the *Register Book*, the condition of the protective coating or corrosion prevention system of cargo tanks is to be examined.

8.4.8 The attachment to the structure and condition of anodes in tanks is to be examined.

8.4.9 Where fitted, the strums of the cargo suction pipes are to be removed or lifted to facilitate examination of the shell plating and bulkheads in the vicinity, unless other means for visual inspection of these parts are provided.

8.5 Testing

8.5.1 The minimum ballast tank testing requirements are given in Table 3.8.1 Tank testing requirements - Chemical tankers and, where required, the Surveyor may extend the tank testing if deemed necessary. Other arrangements for cargo tank testing will be considered on application. The remaining requirements for tank testing, as applicable, are given in Pt 1, Ch 3, 5.3 Examination and testing.

8.5.2 The minimum cargo tank testing requirements are given in Table 3.8.1, boundaries of cargo tanks are to be tested to the highest point that liquid will rise to under service conditions. Other arrangements for cargo tank testing will be considered on application.

Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor provided the following conditions are complied with:

- (a) A tank testing procedure has been submitted by the Owner and reviewed by LR prior to the testing being carried out.
- (b) There is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank.
- (c) The tank testing has been satisfactorily carried out within the special survey window not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed.
- (d) The satisfactory results of the testing are recorded in the ship's logbook.
- (e) The internal and external condition of the tanks and associated structure is found satisfactory by the Surveyor at the time of the overall and close-up survey.

Table 3.8.1: Tank testing requirements - Chemical tankers

Special Survey I (Ships 5 years old)	Special Survey II and subsequent (Ships 10 years old and over)
All ballast tank boundaries	All ballast tank boundaries
Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	All cargo tank bulkheads

8.6 Close-up Survey

8.6.1 The minimum requirements for Close-up Survey are given in Table 3.8.2 Close-up Survey - Single hull chemical tankers (Single hull chemical tankers) and Table 3.8.3 Close-up Survey - Double hull chemical tankers (Double hull chemical tankers).

Periodical Survey Regulations

Part 1, Chapter 3

Section 8

Table 3.8.2: Close-up Survey - Single hull chemical tankers

Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)	Special Survey IV (Ships 20 years old and over)
(1) One web frame ring in a ballast wing tank, see Note 1	(1) All web frame rings in a ballast wing tank or double bottom ballast tank, see Note 1	(1) All web frame rings in all ballast tanks, see Note 1	(1) As Special Survey III
(2) One deck transverse in a cargo tank or on deck, see Note 2	(2) One deck transverse in each remaining ballast tank or on deck, see Note 2	(2) All web frame rings in a cargo wing tank, see Note 1	(2) Additional transverse areas if deemed necessary by the Surveyor
(3) One transverse bulkhead in a ballast tank, see Note 3	(3) One deck transverse in a cargo wing tank or on deck, see Note 2	(3) One web frame ring in each remaining cargo tank, see Note 1	
(4) One transverse bulkhead in a cargo wing tank, see Note 3	(4) One deck transverse in two cargo centre tanks or on deck, see Note 2	(4) All transverse bulkheads – in all cargo and ballast tanks, see Notes 4	
(5) One transverse bulkhead in a cargo centre tank, see Notes 3 and 5	(5) Both transverse bulkheads in a ballast wing tank, see Note 4		
	(6) One transverse bulkhead in remaining ballast tank, see Note 3		
	(7) One transverse bulkhead in a cargo wing tank, see Note 3		
	(8) One transverse bulkhead in two cargo centre tanks, see Notes 3 and 5		
<p>Note 1. Complete transverse web frame ring including adjacent structural members.</p> <p>Note 2. Deck transverse including adjacent deck structural members (or external structure on deck in way of the tank).</p> <p>Note 3. Transverse bulkhead lower part including girder system and adjacent structural members.</p> <p>Note 4. Transverse bulkhead complete, including girder system and adjacent members, and adjacent longitudinal bulkhead structure.</p> <p>Note 5. Where there are no centre tanks, the transverse bulkheads in wing tanks are to be subject to Close-up Survey.</p> <p>Note 6. Ballast tank includes peak tanks.</p>			

Periodical Survey Regulations

Part 1, Chapter 3

Section 8

Table 3.8.3: Close-up Survey - Double hull chemical tankers

Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)	Special Survey IV (Ships 20 years old and over)
(1) One web frame ring in a ballast double hull tank, see Notes 1 and 9	(1) All web frame rings in a ballast wing tank or ballast double hull tank, see Notes 1 and 9	(1) All web frame rings in all ballast tanks, see Note 1	(1) As Special Survey III
(2) One deck transverse in a cargo tank or on deck, see Note 2	(2) The knuckle area and the upper part (approx. 3 m) of one web frame ring in each remaining ballast tank, see Note 6	(2) All web frame rings in a cargo wing tank, see Note 7	(2) Additional transverse areas if deemed necessary by the Surveyor
(3) One transverse bulkhead in a ballast tank, see Note 5	(3) One deck transverse in two cargo tanks, see Note 2	(3) One web frame ring in each remaining cargo tank, see Note 7	
(4) One transverse bulkhead in a cargo wing tank, see Note 3	(4) One transverse bulkhead in each ballast tank, see Note 5	(4) All transverse bulkheads – in all cargo and ballast tanks, see Note 4 and 5	
(5) One transverse bulkhead in a cargo centre tank, see Notes 3 and 8	(5) One transverse bulkhead in a cargo wing tank, see Note 3		
	(6) One transverse bulkhead in two cargo centre tanks, see Notes 3 and 8		

Note 1. Web frame ring in a ballast tank includes the vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in a double deck tank (where fitted) and adjacent structural members. In peak tanks, a web frame means a complete transverse web frame ring, including adjacent structural members.

Note 2. Deck transverse including adjacent deck structural members (or external structure on deck in way of the tank), where applicable.

Note 3. Transverse bulkhead lower part in cargo tanks, including girder system and adjacent structural members (including longitudinal bulkheads) and internal structure of lower stools, where fitted.

Note 4. Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (including longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.

Note 5. Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members including longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.

Note 6. The knuckle area and the upper part (approximately 3 m), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the sloping hopper plating to the inner hull bulkhead and the inner bottom plating, up to 2 m from the corners both on the bulkhead and the double bottom.

Note 7. Web frame ring in a cargo tank includes deck transverse, longitudinal bulkhead vertical girder and cross ties, where fitted, and adjacent structural members.

Note 8. Where there are no centre tanks, the transverse bulkheads in wing tanks are to be subject to Close-up Survey.

Note 9. Double hull tank includes double bottom and side tank even though these tanks may be separate.

Note 10. Ballast tank includes peak tanks.

8.6.2 The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system, and the following:

- (a) Structural arrangements or details which have suffered defects in similar spaces or on similar ships.
- (b) Spaces which have structures approved with reduced scantlings in association with an approved corrosion control system.

8.6.3 For areas in tanks where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of Close-up Surveys may be specially considered.

8.7 Thickness measurement

8.7.1 The minimum requirements for thickness measurements are given in Table 3.8.4 Thickness measurement - Single and double hull chemical tankers, see *also* Pt 1, Ch 3, 5.6 Thickness measurement.

Periodical Survey Regulations

Part 1, Chapter 3

Section 8

Table 3.8.4: Thickness measurement - Single and double hull chemical tankers

Special Survey I (Ships 5 years old)	Special Survey III (Ships 15 years old)	Special Survey IV (Ships 20 years old and over)
<p>(1) 1 section of deck plating for the full beam of the ship within 0,5L amidships (in way of a ballast tank, if any)</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.8.3 Close-up Survey - Double hull chemical tankers</p> <p>(3) Critical areas, as required by the Surveyor</p>	<p>(1) Within the cargo area:</p> <p>(a) Each deck plate</p> <p>(b) 2 transverse sections</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.8.3 Close-up Survey - Double hull chemical tankers</p> <p>(3) Selected wind and water strakes outside the cargo area</p>	<p>(1) Within the cargo area:</p> <p>(a) Each deck plate</p> <p>(b) 3 transverse sections</p> <p>(c) Each bottom plate</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.8.3 Close-up Survey - Double hull chemical tankers</p>
<p>Special Survey II (Ships 10 years old)</p>	<p>(4) All wind and water strakes within the cargo area</p>	<p>(3) All wind and water strakes over the full length of the ship, port and starboard</p>
<p>(1) Within the cargo area:</p> <p>(a) Each deck plate</p> <p>(b) 1 transverse section</p> <p>(2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.8.3 Close-up Survey - Double hull chemical tankers</p> <p>(3) Selected wind and water strakes outside the cargo area</p> <p>(4) Critical areas, as required by the Surveyor</p>	<p>(5) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 1 and 4</p> <p>(6) Critical areas, as required by the Surveyor</p>	<p>(4) Remaining exposed main deck plating not considered in item (1) and representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck)</p> <p>(5) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 1 and 4</p> <p>(6) All keel plates outside the cargo tank length. Also additional bottom plates in way of cofferdams, machinery space and aft end of tanks</p> <p>(7) Plating of seachests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor</p> <p>(8) Critical areas, as required by the Surveyor</p>
<p>Note 1. For areas in tanks where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of thickness measurements may be specially considered, but not dispensed with in its entirety.</p> <p>Note 2. Transverse sections should be chosen where the largest reductions are likely to occur, or as revealed by deck plating measurements.</p> <p>Note 3. Where two or three transverse sections are required to be measured, at least one is to include a ballast tank within 0,5L amidships.</p> <p>Note 4. Transverse bulkhead complete including stiffening system.</p>		

8.7.2 In areas where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, has been noted, then additional measurements are to be carried out, as applicable, in accordance with Table 3.8.5 Thickness measurement - Single and double hull chemical tankers - Bottom, inner bottom and hopper structure with substantial corrosion, Table 3.8.6 Thickness measurement - Single and double hull chemical tankers - Deck structure with substantial corrosion, Table 3.8.7 Thickness measurement - Single and double hull chemical tankers - Side shell and longitudinal bulkheads with substantial corrosion and Table 3.8.8 Thickness measurement - Single and double hull chemical tankers - Transverse watertight bulkheads and swash bulkheads with substantial corrosion to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out.

Periodical Survey Regulations

Part 1, Chapter 3

Section 8

Table 3.8.5: Thickness measurement - Single and double hull chemical tankers - Bottom, inner bottom and hopper structure with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Bottom, inner bottom and hopper plating	Minimum of 3 bays across double bottom tank, including aft bay. Measurement around and under all suction strums	5 point pattern for each panel between longitudinals and floors
(2) Bottom, inner bottom and hopper longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertical web
(3) Bottom girders, including watertight girders	At the fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across face flat (if fitted)
(4) Bottom floors, including watertight floors	3 floors in bays where bottom plating measured, with measurements at both ends and middle	5 point pattern over 2 m ² area
(5) Hopper web frame ring	3 floors in bays where bottom plating measured	5 point pattern over 1 m ² of plating. Single measurements on flange
(6) Hopper transverse watertight bulkhead or swash bulkhead	(i) Lower $\frac{1}{3}$ of bulkhead	(i) 5 point pattern over 1 m ² of plating
	(ii) Upper $\frac{2}{3}$ of bulkhead	(ii) 5 point pattern over 2 m ² of plating
	(iii) Stiffeners (minimum of 3)	(iii) For web, 5 point pattern over span (2 measurements across web at each end and 1 at centre of span). For flange, single measurement at each end and centre of span
(7) Panel stiffening	Where applicable	Single measurements

Table 3.8.6: Thickness measurement - Single and double hull chemical tankers - Deck structure with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Deck plating	2 transverse bands across tank	Minimum of 3 measurements per plate per band
(2) Deck longitudinals	Every 3rd longitudinal in each of 2 bands with a minimum of 1 longitudinal	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
(3) Deck girders and brackets	At the fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with 1 measurement between each panel stiffener, or a minimum of 3 measurements. 2 measurements across flange. 5 point pattern on girder/bulkhead brackets
(4) Deck transverse webs	Minimum of 2 webs, with measurements at both ends and middle of span	5 point pattern over 1 m ² area. Single measurements on the flange
(5) Vertical web and transverse bulkhead in wing ballast tank (2 m from deck) – for double hull chemical tankers	Minimum of 2 webs, and both transverse bulkheads	5 point pattern over 1 m ² area
(6) Panel stiffening	Where applicable	Single measurements

Periodical Survey Regulations

Part 1, Chapter 3

Section 8

Table 3.8.7: Thickness measurement - Single and double hull chemical tankers - Side shell and longitudinal bulkheads with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Side shell and longitudinal bulkhead plating:		
(i) Top and bottom strakes, and strakes in way of horizontal girders	(i) Plating between each pair of longitudinals in a minimum of 3 bays (along the tank)	(i) Single measurements
(ii) All other strakes	(ii) Plating between every 3rd pair of longitudinals on same 3 bays	(ii) Single measurements
(2) Side shell and longitudinal bulkhead longitudinals on:		
(i) Top and bottom strakes	(i) Each longitudinal in same 3 bays	(i) 3 measurements across web and 1 measurement on flange
(ii) All other strakes	(ii) Every 3rd longitudinal in same 3 bays	(ii) 3 measurements across web and 1 measurement on flange
(3) Longitudinals – brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
(4) Vertical web and transverse bulkheads of double side tanks (excluding deckhead area):		
(i) Strakes in way of horizontal girders	(i) Minimum of 2 webs and both transverse bulkheads	(i) 5 point pattern over approximately 2 m ² area
(ii) Other strakes	(ii) Minimum of 2 webs and both transverse bulkheads	(ii) 2 measurements between each pair of vertical stiffeners
(5) Web frames and cross ties for other tanks than double side tanks	3 webs with minimum of 3 locations on each web, including in way of cross tie connections and lower end bracket	5 point pattern over approximately 2 m ² area of webs, plus single measurements on flanges of web frame and cross ties
(6) Horizontal girders	Plating on each girder in a minimum of 3 bays	2 measurements between each pair of longitudinal girder stiffeners
(7) Panel stiffening	Where applicable	Single measurements

Periodical Survey Regulations

Part 1, Chapter 3

Section 9

Table 3.8.8: Thickness measurement - Single and double hull chemical tankers - Transverse watertight bulkheads and swash bulkheads with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
(1) Upper and lower stool, where fitted	Transverse band within 25 mm of welded connection to inner bottom/deck plating Transverse band within 25 mm of welded connection to shelf plate	5 point pattern between stiffeners over 1 m length
(2) Top and bottom strakes, and strakes in way of horizontal stringers	Plating between pair of stiffeners at 3 locations; approximately $\frac{1}{4}$, $\frac{1}{2}$ and $\frac{3}{4}$ width of tank	5 point pattern between stiffeners over 1 m length
(3) All other strakes	Plating between pair of stiffeners at middle location	Single measurement
(4) Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5 point pattern over approximately 1 m ² of plating
(5) Stiffeners	Minimum of 3 typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and 1 at centre of span). For flange, single measurement at bracket toe and at centre of span
(6) Brackets	Minimum of 3 at top, middle and bottom of tank	5 point pattern over area of bracket
(7) Horizontal stringers	All stringers with measurements at both ends and middle	5 point pattern over 1 m ² area, plus single measurements near bracket toes and on flanges
(8) Deep webs and girders	Measurements at toe of bracket and centre of span	For webs, 5 point pattern over 1 m ² area. 3 measurements across face flat

8.8 Ships over 10 years old

8.8.1 Selected steel cargo pipes outside cargo tanks and ballast pipes passing through cargo tanks are to be:

- Thickness measured at random or selected pipe lengths to be opened for internal inspection.
- Pressure tested to the maximum working pressure.

Note Special attention is to be given to cargo/slop discharge piping through ballast tanks and void spaces.

Section 9 Ships for liquefied gases

9.1 General

9.1.1 The requirements of Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements to Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements are to be complied with, as applicable.

9.1.2 Prior to the inspection of cargo tanks, surrounding spaces, associated piping, fittings and equipment, etc. the respective items are to be cleaned and thoroughly cleared of gas. Every precaution is to be taken to ensure safety during inspection.

9.1.3 The following documentation, as applicable, is to be available on board the ship:

- (a) Relevant instruction and information material such as cargo handling plans, filling limit information, cooling down procedures, etc.
- (b) A copy of the IGC Code.
- (c) Test records of secondary barrier.
- (d) Loading and stability information, including damage stability.

9.1.4 For requirements of Special Survey for electrical equipment, see Pt 1, Ch 3, 14 Electrical equipment.

9.2 Annual Surveys – Basic requirements

9.2.1 The Annual Survey is preferably to be carried out during a loading or discharging operation. Access to cargo tanks or inerted hold spaces, necessitating gasfreeing/ aerating will normally not be necessary unless required by the Regulations.

9.2.2 The ship's log and operational records for the cargo containment system covering the period from the previous survey are to be examined. Any malfunction of the system entered in the log is to be investigated, the cause ascertained, and that part of the system at fault is to be found or placed in good order.

9.2.3 Instrumentation and safety systems are to be surveyed as follows:

- (a) The instrumentation of the cargo installations with regard to pressure, temperature and liquid level is to be verified in good working order by one or more of the following methods:
 - (i) Visual external examination.
 - (ii) Comparing of read outs from different indicators.
 - (iii) Consideration of read outs with regard to the actual cargo and/or actual conditions.
 - (iv) Examination of maintenance records with reference to cargo plant instrumentation maintenance manual.
 - (v) Verification of calibration status of the measuring instruments.
- (b) The low level, high level, and overfill alarms are to be examined and tested to ascertain that they are in working order.
- (c) The alarms associated with the following are to be tested as applicable:
 - (i) Cargo tank high and low pressure.
 - (ii) Cargo tank temperature.
 - (iii) Cargo hold pressure.
 - (iv) Interbarrier space pressure.
 - (v) Inner hull temperature.
 - (vi) Secondary barrier temperature.
 - (vii) Cargo Hold or Interbarrier bilge level detection.
- (d) Control devices for the cargo containment systems and cargo handling equipment, together with any associated shutdown and/or interlock, are to be checked under simulated working conditions and, if necessary, recalibrated. Such safety systems include but are not limited to:
 - (i) Cargo tank overfill protection including cargo pump, compressor and other cargo machinery automatic shutdown.
 - (ii) Cargo pump, compressor and other cargo machinery shutdown on low cargo tank pressure or cargo tank and interbarrier/hold space differential pressure.
 - (iii) Cargo pump automatic shutdown on low level or current;
- (e) The emergency shutdown system is to be tested, without flow in the pipe lines, to verify that the system will cause the cargo pumps, compressors and other cargo machinery, as applicable, to stop.
- (f) Consideration will be given to the acceptance of simulated tests, provided that they are carried out at the cargo temperature, or comprehensive maintenance records, including details of tests held, in accordance with the cargo plant instrumentation maintenance manual.

9.2.4 Cargo gas leakage detection systems are to be examined and tested to ascertain that they are in working order and calibrated using sample gas.

9.2.5 Inert gas/dry air installations including the means for prevention of backflow of cargo vapour to gas-safe spaces are to be verified as being in satisfactory operating condition.

9.2.6 Ventilation systems and air locks in working spaces are to be checked for satisfactory operation.

Periodical Survey Regulations

Part 1, Chapter 3

Section 9

9.2.7 Cargo pipeline, valves and fittings are to be generally examined, with special reference to expansion bellows, supports and vapour seals on insulated pipes. It is to be verified that all accessible cargo piping systems are electrically bonded to the hull.

9.2.8 Portable and/or fixed drip trays, or insulation for deck protection in the event of cargo leakage, are to be examined for condition.

9.2.9 The means for accomplishing gas tightness of the wheelhouse doors and windows is to be examined. All windows and side-scuttles within the area required to be of the fixed type (non-opening) are to be examined for gas tightness. The closing devices for all air intakes and openings into accommodation spaces, service spaces, machinery spaces, control stations and approved openings in superstructures and deckhouses facing the cargo area or bow and stern loading/unloading arrangements are to be examined. For ships carrying toxic gases such devices should be capable of being operated from inside the space.

9.2.10 Venting systems, including protection screens if provided, for the cargo tanks, inter-barrier spaces and hold spaces are to be visually examined externally. It is to be verified that the cargo tank relief valves are sealed and that the certificate for the relief valves opening/closing pressures is on board the ship.

9.2.11 Mechanical ventilation fans in gas hazardous zones and spaces are to be visually examined. Adequate spare parts should be carried for each type of fan installed.

9.2.12 Electrical equipment, cables and supports in gas hazardous zones and spaces shall be examined as far as practicable. Alarms and safety systems associated with pressurised lighting systems and any safety device associated with nonsafe type electrical equipment that is protected by air-locks are to be verified.

9.2.13 Heating arrangements, if fitted, for cofferdams and other spaces shall be verified in good working order.

9.2.14 All accessible gas-tight bulkhead penetrations including gas-tight shaft sealings are to be visually examined.

9.2.15 The sealing arrangements for tanks or tank domes penetrating decks or tank covers are to be externally examined.

9.2.16 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull and piping are maintained in a satisfactory condition.

(a) The examination of the hull and piping is to include the following:

- hull plating and closing appliances as far as can be seen
- watertight penetrations as far as practicable
- weather decks
- flame screens on vents to all bunker tanks
- bunker and vent piping systems

(b) The examination of the cargo pump rooms and compressor rooms and, as far as practicable, pipe tunnels if fitted is to include the following:

- all pump room and compressor room bulkheads for signs of leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room and compressor room bulkheads
- condition of all piping systems (for cargo piping systems, see Pt 1, Ch 3, 9.2 Annual Surveys – Basic requirements).

9.2.17 The Surveyor is to carry out an examination and thickness measurement of structure identified at the previous Special Survey or Intermediate Survey as having substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions. The extent of thickness measurements is to be increased in accordance with Table 3.9.4 Thickness measurement - Ships for liquefied gases - Structural areas with substantial corrosion to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out.

9.3 Annual Surveys – Reliquefaction/refrigeration equipment

9.3.1 Where reliquefaction or refrigeration equipment for cargo temperature and pressure control is fitted, the following are to be examined, so far as practicable:

- (a) The machinery under working conditions.
- (b) The shells of all pressure vessels in the system, externally. Insulation need not be removed for this examination, but any deterioration of insulation or evidence of dampness which could lead to external corrosion of the vessels or their connections, is to be investigated.
- (c) Primary refrigerant gas and liquid pipes, cargo vapour and liquid condensate pipes and condenser cooling water pipes. Insulation need not be removed, but any deterioration or evidence of dampness is to be investigated.
- (d) The reliquefaction/refrigeration plant spare gear.

9.3.2 Reference should be made to the Special Survey requirements for guidance on Continuous Survey arrangements.

9.4 Annual Surveys – Methane burning equipment and other equipment components

9.4.1 The following components are to be generally examined externally. If insulation is fitted, this need not be removed, but any deterioration of insulation, or evidence of dampness which could lead to external corrosion of the vessels or their connections, is to be investigated:

- (a) Heat exchangers and pressure vessels for use with methane burning in boilers or machinery.
- (b) Cargo heaters, vaporisers, masthead heaters and other miscellaneous pressure vessels.

9.4.2 Controls and interlocks are to be checked.

9.4.3 Alarm systems are to be checked to ascertain that they are in working order.

9.4.4 Exhaust fans and/or pressurising system for gas trunking are to be tested.

9.5 Annual Surveys – Cargo containment systems

9.5.1 Where the insulation arrangement is such that the insulation cannot be examined, the surrounding structures of wing tanks, double bottom tanks and cofferdams are to be examined for cold spots, prior to the survey. This examination is to be held at a convenient cargo discharge operation with the cargo tanks loaded at approximately the minimum notation temperature.

9.5.2 On application by the Owner, consideration will be given to the cold spot examination, where applicable, being carried out by the ship's staff.

9.5.3 When tests are required after repairs, independent cargo tanks, other than independent tanks type C, are to be tested by hydraulic or hydropneumatic means as appropriate. Test heads and pressures should be as defined in Ch 4, 10 Construction and testing of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk*. Cargo tanks of the membrane or semi-membrane type are to be tested by means of a detectable gas in the inter-barrier spaces and discolouring paint on the weld seams of the cargo tanks wall, or other suitable means. Independent cargo tanks of type C are to be tested hydraulically at 1,25 times the approved maximum vapour pressure.

9.5.4 For membrane containment systems, the Surveyor is to receive confirmation from the Master that the nitrogen control system for insulation and inter-barrier spaces is operating normally.

9.6 Intermediate Surveys

9.6.1 The Intermediate Survey intends to supplement the Annual Survey by testing cargo handling installations with related automatic control, alarm and safety systems for correct functioning. The Intermediate Survey is preferably to be carried out with the ship in a gas-free condition. The extent of the testing required for the Intermediate Survey will normally be such that the survey cannot be carried out during a loading or discharging operation.

9.6.2 In addition to the requirements for Annual Survey and the requirements of Pt 1, Ch 3, 3.2 Intermediate Surveys, the following are to be dealt with as applicable:

- (a) Examination of means for draining the vent piping system.
- (b) Verification that pipelines and cargo tanks are electrically bonded to the hull.
- (c) Verification that the heating arrangements, if any, for steel structures are satisfactory.
- (d) Where required by the manufacturer's maintenance instructions, cargo tank and inter-barrier space pressure and vacuum relief valve settings are to be checked and adjusted as required. Cargo tank pressure relief valve harbour settings are also to be checked, if applicable. Cargo tank pressure relief valves are to lift at a pressure not more than the percentage given below, above the maximum vapour pressure for which the tanks have been approved.
 - For 0 to 1,5 bar (0 to 1,5 kgf/cm²), 10 per cent.
 - For 1,5 to 3,0 bar (1,5 to 3,0 kgf/cm²), 6 per cent.
 - For pressures exceeding 3,0 bar (3,0 kgf/cm²), 3 per cent.
 - Valves may be removed from the tanks for the purpose of checking.
- (e) A General Examination within the zones and spaces deemed as hazardous, such as cargo compressor rooms and spaces adjacent to and zones above cargo areas, for defective and non-certified safe-type electrical equipment, improperly installed, defective and dead wiring. An electrical insulation resistance test of the circuits terminating in, or passing through the hazardous zones and spaces, is to be carried out. If the ship is not in a gas free condition the results of previously recorded test readings may be accepted.

Periodical Survey Regulations

Part 1, Chapter 3

Section 9

9.6.3 For ships over 5 years of age and up to 10 years of age, an overall survey of representative ballast tanks is to be carried out. Where a hard protective coating is found to be in POOR condition, as defined in Pt 1, Ch 3, 1.5 Definitions, where a soft or semi-hard coating has been applied or where a protective coating was not applied from the time of construction, the survey is to be extended to other ballast tanks of the same type.

9.6.4 For ships over 10 years of age, an overall survey of all ballast tanks is to be carried out.

- (a) If such examinations reveal no visible structural defects, the examination may be limited to verification that the corrosion prevention system remains in GOOD or FAIR condition.
- (b) The condition of the corrosion prevention system identified during the Survey may result in the tanks being subject to further examination at Annual Surveys, in accordance with Pt 1, Ch 3, 2.2 Annual Surveys. For independent double bottom ballast tanks, the examination at Annual Surveys will be at the discretion of the Surveyor.

9.6.5 The minimum requirements for Close-up Survey are given in Table 3.9.1 Ships for liquified gases - Intermediate Surveys.

Table 3.9.1: Ships for liquified gases - Intermediate Surveys

Ships between 10 and 15 years old	Ships greater than 15 years old
<p>(1) Close-up survey of all web frames and both transverse bulkheads in a representative ballast tank, see Note 2 and 3.</p> <p>(2) Close-up survey of the upper part of one web frame in one other representative ballast tank.</p> <p>(3) Close-up survey of one transverse bulkhead in one other representative ballast tank, see Note 3.</p>	<p>(1) Close-up survey of all web frames and both transverse bulkheads in a two representative ballast tanks, see Notes 2 and 3.</p>
<p>Note 1. Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.</p> <p>Note 2. Complete transverse web frame including adjacent structural members.</p> <p>Note 3. Transverse bulkhead complete, including girder system and adjacent structural members and adjacent longitudinal bulkhead structure.</p> <p>Note 4. For areas in tanks where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of Close-up Survey may be specially considered.</p> <p>Note 5. The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system, the structural arrangements or details which have suffered defects in similar spaces or on similar ships and tanks having structures approved with reduced scantlings.</p> <p>Note 6. For ships having independent cargo tanks of Type C, with a midship section similar to that of a general cargo ship, the extent of Close-up Survey may be specially considered.</p>	

9.7 Special Survey I (ships five years old) – General requirements

9.7.1 The requirements of Pt 1, Ch 3, 9.1 General to Pt 1, Ch 3, 9.6 Intermediate Surveys are to be complied with.

9.7.2 The requirements for Close-up Survey and thickness measurement are given in Pt 1, Ch 3, 9.12 Close-up Survey and Pt 1, Ch 3, 9.13 Thickness measurement.

9.7.3 All cargo tanks are to be examined internally, also externally so far as practicable, particular attention being paid to the plating in way of supports of securing arrangements, tower structures, seatings and pipe connections, also to sealing arrangements in way of the deck penetrations. Provided that the structural examination is satisfactory, that the gas leakage monitoring systems have been found to be operating satisfactorily and that the voyage records have not shown any abnormal operation, cargo tanks do not require to be hydraulically tested. The primary membranes of 'Gas Transport' design should be examined with the primary insulation space under a vacuum of at least -500 mbar gauge. For 'Moss Type' LNG cargo tanks, the Structural Transition Joints (STJ) are to be examined at the port, starboard, forward and aft locations. Insulation is to be removed as required. Non-destructive testing may be required where considered necessary. For membrane containment systems with corrugated primary barriers, in view of the sloshing loads experienced in service, measurements should, if required, be taken inside the cargo tanks of deformations of the primary barrier corrugations in order to assess the condition of the containment system in accordance with the system designer's procedures as approved by LR.

9.7.4 The non-destructive testing of cargo tanks is to be carried out as follows:

-
- (a) Non-destructive testing is to supplement cargo tank inspection with special attention to be given to the integrity of the main structural members, tank shell and highly stressed parts, including welded connections as deemed necessary by the Surveyor. The following items are, inter alia, considered as highly stressed parts:
- (i) Cargo tanks supports and anti-rolling/antipitching devices;
 - (ii) Web frames or stiffening rings;
 - (iii) Swash bulkhead boundaries;
 - (iv) Dome and stump connections to tank shell;
 - (v) Foundations for pumps, towers, ladders, etc.;
 - (vi) Pipe connections.
- (b) For independent tanks of Type B, the extent of non-destructive testing shall be as given in the programme specially prepared for the cargo tank design.
- (c) Independent cargo tanks of Type C are to be subjected to non-destructive testing of the plating in way of supports and also at selected lengths of welds. Where such testing raises doubt as to the structural integrity, a hydraulic test should be carried out at 1,25 times the approved maximum vapour pressure. Alternatively, consideration will be given to pneumatic testing under special circumstances, provided full details are submitted for approval.
- (d) At each alternate Special Survey (i.e. SSII, SSIV and so on), all independent cargo tanks of Type C are to be either:
- (i) Hydraulically or hydro-pneumatically tested to 1,25 times MARVS, followed by non-destructive testing in accordance with paragraph Pt 1, Ch 3, 9.7 Special Survey I (ships five years old) – General requirements above, or,
 - (ii) Subjected to a thorough, planned, non-destructive testing. This testing is to be carried out in accordance with a programme specially prepared for the tank design. If a special programme does not exist, the following applies:
- cargo tank supports and anti-rolling/anti-pitching devices;
 - stiffening rings;
 - Y-connections between tank shell and a longitudinal bulkhead of bi-lobe tanks;
 - swash bulkhead boundaries;
 - dome and sump connections to the tank shell;
 - foundations for pumps, towers, ladders etc.;
 - pipe connections.

At least 10 per cent of the length of the welded connections in each of the above mentioned areas is to be tested. This testing is to be carried out internally and externally as applicable. Insulation is to be removed as necessary for the required non-destructive testing.

9.7.5 Deck mounted cargo storage tanks are to be examined in the same manner as main cargo tanks.

9.7.6 For membrane containment systems, a tightness test of the primary and secondary barrier shall be carried out in accordance with the system designer's procedures and acceptance criteria as approved by LR. Low differential pressure tests may be used for monitoring the cargo containment system performance, but are not considered an acceptable test for the tightness of the secondary barrier. For membrane containment systems with glued secondary barriers, if the designer's threshold values are exceeded, an investigation is to be undertaken and additional testing such as thermographic or acoustic emissions testing should be carried out.

9.7.7 Where a cargo tank or the hull structure is insulated and the insulation is accessible, the insulation should be examined externally, together with any vapour or protective barrier, and sections removed for examination, if considered necessary by the Surveyor. Special attention should be given to insulation in way of chocks, supports and keys. Portions of the insulation are also to be removed, if required by the Surveyor, to enable the condition of the plating to be ascertained. Where the insulation is not accessible, see Pt 1, Ch 3, 9.5 Annual Surveys – Cargo containment systems.

9.7.8 Cargo tank internal pipes and fittings are to be examined, and all valves and cocks in direct communication with the interiors of the tanks are to be opened out for inspection and the connection pipes are to be examined internally, so far as practicable.

9.7.9 Relief valves are to be surveyed as follows:

- (a) The pressure relief valves for the cargo tanks are to be opened for examination, adjusted, function tested, and sealed. If the cargo tanks are equipped with relief valves with non-metallic membranes in the main or pilot valves, such non-metallic membranes are to be replaced.

- (b) Pressure relief valves are subsequently to be adjusted to lift at a pressure in accordance with Pt 1, Ch 3, 9.6 Intermediate Surveys. Relief valve harbour settings are to be checked, if applicable. Valves may be removed from the shell for the purpose of making this adjustment under pressure of air or other suitable gas.
- (c) Where a proper record of continuous overhaul and retesting of individually identifiable relief valves is maintained, consideration will be given to acceptance on the basis of opening, internal examination, and testing of a representative sampling of valves, including each size and type of liquefied gas or vapour relief valve in use, provided there is logbook evidence that the remaining valves have been overhauled and tested since crediting of the previous Special Survey.
- (d) Relief valves on cargo gas and liquid pipelines are to have their pressure settings checked. The valves may be removed from the pipelines for this purpose. At the Surveyor's discretion a sample of each size and type of valve may be opened for examination and testing.

9.7.10 All cargo pumps, cargo booster pumps and cargo vapour pumps are to be opened out for examination. If requested by the Owner, these items may be examined on a Continuous Survey basis, provided the interval between examination of each item does not exceed five years. Pumping systems for inter-barrier spaces are to be checked and verified to be in good working order.

9.7.11 Piping for cargo and process systems including valves, actuators and compensators are to be opened for examination. Insulation may need to be removed, as deemed necessary, to ascertain the condition of the piping. If any doubt exists regarding the integrity of the piping based upon visual examination then, where deemed necessary by the Surveyor, a pressure test at 1,25 times MARVS for the pipeline is to be carried out. The complete piping systems are to be tested for leaks after re-assembly.

9.7.12 Equipment for the production of inert gas is to be examined and shown to be operating satisfactorily within the gas specification limits. Pipelines, valves, etc. for the distribution of the inert gas are to be generally examined. Pressure vessels for the storage of inert gas are to be examined internally and externally and the securing arrangements are to be specially examined. Pressure relief valves are to be demonstrated to be in good working order. Liquid nitrogen storage vessels are to be examined, so far as practicable, and all control equipment, alarms and safety devices are to be verified as operational.

9.7.13 Gastight bulkhead shaft seals are to be opened out so that the sealing arrangements may be checked.

9.7.14 Sea connections associated with the cargo handling equipment are to be opened out when the ship is in dry-dock.

9.7.15 The arrangements for discharging the cargo overboard in an emergency are to be checked.

9.8 Special Survey I (ships five years old) – Reliquefaction/refrigeration equipment

9.8.1 Each reciprocating compressor is to be opened out. Cylinder bores, pistons, piston rods, connecting rods, valves and seats, glands, relief devices, suction filters and lubricating arrangements are to be examined. Crankshafts are to be examined, but crankcase glands and the lower half of main bearings need not be exposed if the Surveyor is satisfied with the alignment and wear.

9.8.2 Where other than reciprocating-type compressors are fitted, or where there is a program of replacement instead of surveys on board, alternative survey arrangements will be considered. Each case will be given individual consideration.

9.8.3 The water end covers of condensers are to be removed for examination of the tubes, tubeplates and covers.

9.8.4 Refrigerant condenser cooling water pumps, including standby pump(s) which may be used on other services, are to be opened out for examination.

9.8.5 Where a pressure vessel is insulated, sufficient insulation is to be removed, especially in way of connections and supports, to enable the vessel's condition to be ascertained.

9.8.6 Insulated pipes are to have sufficient insulation removed to enable their condition to be ascertained. Vapour seals are to be specially examined for their condition.

9.8.7 The Surveyor is to satisfy himself that all pressure relief valves and/or safety discs throughout the system are in good order. No attempt, however, is to be made to test primary refrigerant pressure relief valves on board ship.

9.8.8 The items covered by Pt 1, Ch 3, 9.8 Special Survey I (ships five years old) – Reliquefaction/refrigeration equipment to Pt 1, Ch 3, 9.8 Special Survey I (ships five years old) – Reliquefaction/refrigeration equipment may, at the request of the Owner, be examined on a Continuous Survey basis provided the interval between examination of each item does not exceed five years.

9.9 Special Survey I (ships five years old) – Methane burning equipment

9.9.1 Where methane is used as fuel for main propulsion purposes, the associated compressors and heat exchangers are to be opened out and examined as for reliquefaction/refrigeration equipment. The steam side of steam heaters is to be hydraulically tested to 1,5 times the design pressure.

9.9.2 Methane gas pipe trunks or casings are to be generally examined and the exhaust or inerting arrangements for these trunks are to be verified.

9.9.3 All alarms associated with the methane burning systems are to be verified.

9.10 Special Survey II and Special Surveys thereafter (ships 10 years old and over)

9.10.1 The requirements of Pt 1, Ch 3, 9.1 General to Pt 1, Ch 3, 9.9 Special Survey I (ships five years old) – Methane burning equipment are to be complied with.

9.10.2 Water cooled condensers in which the primary refrigerant is in contact with the shell are to have the end covers removed and the shell pneumatically tested to a pressure equal to the designed working pressure.

9.10.3 All other pressure vessels in the reliquefaction/refrigeration system, methane burning system and other handling systems are to be pneumatically tested to a pressure equal to the designed working pressure.

9.10.4 The requirements for Close-up Survey and thickness measurement are given in Pt 1, Ch 3, 9.12 Close-up Survey and Pt 1, Ch 3, 9.13 Thickness measurement.

9.11 Special Survey III and Special Surveys thereafter (ships 15 years old and over)

9.11.1 The requirements of Pt 1, Ch 3, 9.1 General to Pt 1, Ch 3, 9.10 Special Survey II and Special Surveys thereafter (ships 10 years old and over) are to be complied with.

9.11.2 For independent tanks of Type B, the Owner is to submit proposals for the extent of non-destructive testing of the cargo tanks well in advance of the Special Survey.

9.12 Close-up Survey

9.12.1 The minimum requirements for Close-up Survey are given in Table 3.9.2 Close-up Survey - Ships for liquefied gases.

9.12.2 The Surveyor may extend the Close-up Survey, if deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and the structural arrangements or details which have suffered defects in similar spaces or on similar ships and tanks having structures approved with reduced scantlings.

9.12.3 For areas in tanks where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of Close-up Survey may be specially considered.

Periodical Survey Regulations

Part 1, Chapter 3

Section 9

Table 3.9.2: Close-up Survey - Ships for liquefied gases

Special Survey I (Ships 5 years old)	Special Survey II (Ships 10 years old)	Special Survey III (Ships 15 years old)	Special Survey IV (Ships 20 years old and over)
(1) One web frame in: (a) a topside ballast tank (b) a hopper side ballast tank (c) a double hull side ballast tank See Note 2. (2) One transverse bulkhead in a ballast tank, see Note 4.	(1) All web frames in either a topside ballast tank or a double hull side ballast tank, see Notes 2 and 5. (2) One web frame in each remaining ballast tank, see Note 2. (3) One transverse bulkhead in each ballast tank, see Note 3.	(1) All web frames in all ballast tanks, see Note 2. (2) All transverse bulkheads in all ballast tanks, see Note 3.	(1) All web frames in all ballast tanks, see Note 2. (2) All transverse bulkheads in all ballast tanks, see Note 3.
<p>Note 1. Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned, and peak tanks where fitted.</p> <p>Note 2. Complete transverse web frame ring including adjacent structural members.</p> <p>Note 3. Transverse bulkhead complete, including girder system and adjacent structural members and adjacent longitudinal bulkhead structure.</p> <p>Note 4. Transverse bulkhead lower part including girder system and adjacent structural members.</p> <p>Note 5. If topside tanks and double hull side tanks are not fitted, then another ballast tank is to be selected.</p> <p>Note 6. For ships having independent cargo tanks of Type C, with a midship section similar to that of a general cargo ship, the extent of Close-up Survey may be specially considered.</p>			

9.13 Thickness measurement

9.13.1 The minimum requirements for thickness measurement are given in Table 3.9.3 Thickness measurement - Ships for liquefied gases.

9.13.2 In areas where substantial corrosion, as defined in Pt 1, Ch 3, 1.5 Definitions, has been noted, then additional measurements are to be carried out in accordance with Table 3.9.4 Thickness measurement - Ships for liquefied gases - Structural areas with substantial corrosion to determine the full extent of the corrosion pattern. The survey will not be considered complete until these additional thickness measurements have been carried out.

Periodical Survey Regulations

Part 1, Chapter 3

Section 9

Table 3.9.3: Thickness measurement - Ships for liquefied gases

Special Survey I (Ships 5 years old)	Special Survey III (Ships 15 years old)	Special Survey IV and subsequent (Ships 20 years old and over)
(1) 1 section of deck plating for the full beam of the ship within 0,5L amidships in way of a ballast tank, if any (2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.9.2 Close-up Survey - Ships for liquefied gases (3) Critical areas, as required by the Surveyor	(1) Within the cargo area: (a) Each deck plate (b) 2 transverse sections (2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.9.2 Close-up Survey - Ships for liquefied gases	(1) Within the cargo area: (a) Each deck plate (b) 3 transverse sections (c) Each bottom plate (d) Duct keel plating and internals (2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to Close-up Survey in accordance with Table 3.9.2 Close-up Survey - Ships for liquefied gases
Special Survey II (Ships 10 years old)	(3) Selected wind and water strakes outside the cargo area	(3) All wind and water strakes over the full length of the ship, port and starboard
(1) Within the cargo area: (a) Each deck plate (b) 1 transverse section (2) Measurements for general assessment and recording of corrosion pattern of the structural members subject to close-up survey in accordance with Table 3.9.2 Close-up Survey - Ships for liquefied gases (3) Selected wind and water strakes outside the cargo area (4) Critical areas, as required by the Surveyor	(4) All wind and water strakes within the cargo area (5) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 1 and 4 (6) Critical areas, as required by the Surveyor	(4) Remaining exposed main deck plating not considered in item (1) and representative exposed superstructure deck plating (i.e. poop, bridge and forecastle deck) (5) All transverse webs with associated plating and longitudinals, and the transverse bulkhead complete in the fore peak tank and aft peak tank, see Notes 1 and 4 (6) All keel plates outside the cargo tank length. Also additional bottom plates in way of cofferdams, machinery space and aft end of tanks (7) Plating of seachests. Also side shell plating in way of overboard discharges, as considered necessary by the Surveyor (8) Critical areas, as required by the Surveyor
<p>Note 1. For areas in tanks where coatings are found to be in GOOD condition, as defined in Pt 1, Ch 3, 1.5 Definitions, the extent of thickness measurements may be specially considered, but not dispensed with in its entirety.</p> <p>Note 2. Transverse sections should be chosen where the largest reductions are likely to occur, or as revealed by deck plating measurements.</p> <p>Note 3. Where two or three transverse sections are required to be measured, at least one is to include a ballast tank within 0,5L amidships.</p> <p>Note 4. Transverse bulkhead complete including stiffening system.</p> <p>Note 5. Where considered necessary by the Surveyor, the inner bottom plating and adjacent tank supports are to be subject to thickness measurement for general assessment and recording of the corrosion pattern.</p> <p>Note 6. For those ships designated to carry light oils in the independent cargo tanks, thickness measurement of the independent cargo tank structure is to be carried out as considered necessary by the Surveyor.</p>		

Table 3.9.4: Thickness measurement - Ships for liquefied gases - Structural areas with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect area and adjacent plates	5 point pattern over 1 m ² of plating
Stiffeners	Suspect area	3 measurements each in line across web and flange

■ Section 10

Dredgers, hopper dredgers, sand carriers, hopper barges and reclamation craft

10.1 General

10.1.1 The requirements of this Section are to be complied with, as applicable, in addition to the survey requirements of Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements, Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements, Pt 1, Ch 3, 4 Docking Surveys and In-water Surveys - Hull and machinery requirements and Pt 1, Ch 3, 5 Special Survey - General - Hull requirements. Where surveys are required on dredging or hopper equipment such as gantries, bottom doors and their operating gear, positioning spuds and suction pipe attachments or split hull devices such as actuating and locking devices, these will be limited to the extent considered necessary by the Surveyor to satisfy himself that their condition or malfunction will not adversely affect the ship's structure.

10.1.2 Where applicable, the Docking Survey is to include the examination of hopper doors and their fittings, and of hopper valves.

10.2 Special Surveys

10.2.1 On ships up to 10 years old (Special Survey I and II):

- Hoppers are to be cleared and cleaned as necessary and examined.
- Where applicable, hopper doors or valves are to be opened and closed, so far as practicable, but keel blocks need not normally be moved specially to permit this to be done.
- The integrity of hopper overflows and diluting water inlet and distribution structures is to be confirmed. Weir valves and sluices are to be tested to ensure proper operation, particular attention being paid to the lower weir when weirs are fitted at more than one level.
- Attention is to be given to shell plating in way of hopper overflows.
- The attachment to the ship's structure of all main items of dredging equipment, including gantries, 'A' frames, spud controlgear supports and items provided to facilitate separation of split hulls including hinge pin gudgeons, anchorages for rams and locking devices, is to be carefully examined to ensure that no fracture is present.

10.2.2 On ships 15 years old and over (Special Survey III and subsequent Special Surveys):

- Attention is to be given by the Surveyor to the structure in way of dredging pumps.
- Hopper doors, valves and items provided to facilitate separation of split hulls are to be checked for proper operation, and their hinges, controlgear and other fittings are to be examined for wear or distortion. All seals and wear-down strips are to be replaced if necessary, but a watertight seal is not normally required. Attention is to be paid to areas likely to be suffering from excessive erosion.
- Those items of dredging gear and equipment whose efficiency is not part of classification but whose failure or malfunctioning is, nevertheless, likely to adversely affect the ship's structure, are to be examined to ensure that the structural integrity of the ship is maintained.

■ Section 11**Machinery surveys - General requirements****11.1 Annual, Intermediate and Docking Surveys**

11.1.1 For Annual, Intermediate and Docking Surveys, see Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements, Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 4 Docking Surveys and In-water Surveys - Hull and machinery requirements.

11.1.2 For ships assigned the notation 'laid-up', a general examination of the machinery is to be carried out in lieu of the normal Annual Survey requirements.

11.2 Complete Surveys

11.2.1 While the ship is in dry-dock, all openings to the sea in the machinery spaces and pump-rooms, together with the valves, cocks and the fastenings with which these are connected to the hull, are to be examined.

11.2.2 All shafts (except screwshafts and tube shafts, for which special arrangements are detailed in Pt 1, Ch 3, 17 Screwshafts, tube shafts and propellers), thrust block and all bearings are to be examined. The lower halves of bearings need not be exposed if alignment and wear are found to be acceptable.

11.2.3 An examination is to be made of all reduction gears complete with all wheels, pinions, shafts, bearings and gear teeth, thrust bearings and incorporated clutch arrangements.

11.2.4 The following auxiliaries and components are also to be examined:

- (a) Auxiliary engines, auxiliary air compressors with their intercoolers, filters and/or oil separators and safety devices, and all pumps and components used for essential services.
- (b) Steering machinery.
- (c) Windlass and associated driving equipment, where fitted.
- (d) Evaporators (other than those of vacuum type) and their safety valves, which should be seen in operation under steam.
- (e) The holding down bolts and chocks of main and auxiliary engines, gearcases, thrust blocks and intermediate shaft bearings.

11.2.5 All air receivers for essential services, together with their mountings, valves and safety devices, are to be cleaned internally and examined internally and externally. If internal examination of the air receivers is not practicable, they are to be tested hydraulically to 1,3 times the working pressure.

11.2.6 The valves, cocks and strainers of the bilge system, including bilge injection, are to be opened up as considered necessary by the Surveyor and, together with pipes, are to be examined and tested under working conditions. The fuel oil, feed, lubricating oil and cooling water systems, as well as the ballast connections and blanking arrangements to deep tanks which may carry liquid or dry cargoes, together with all pressure filters, heaters and coolers used for essential services, are to be opened up and examined or tested, as considered necessary by the Surveyor. All safety devices for the foregoing items are to be examined.

11.2.7 Water ingress detection arrangements fitted on single hold cargo ships having length less than 80 m and bulk carriers and flooding detection systems fitted on passenger ships are to be tested to demonstrate that they are in good working order. Alternatively, this testing may be conducted during the required hull Special Survey space examinations, see *also* Pt 1, Ch 3, 5.3 Examination and testing.

11.2.8 Fuel tanks which do not form part of the ship's structure are to be examined and, if considered necessary by the Surveyor, they are to be tested to the pressure specified for new tanks. The tanks need not be examined internally at the first survey if they are found satisfactory on external inspection. The mountings, fittings and remote controls of all fuel oil tanks are to be examined, so far as practicable.

11.2.9 Where remote and/or automatic controls are fitted for essential machinery, they are to be tested to demonstrate that they are in good working order.

11.2.10 For ships fitted with a dynamic positioning system, the control system and associated machinery items are to be examined and tested under operating conditions to an approved Test Schedule.

11.2.11 In addition to the above, detailed requirements for steam and gas turbines and steam engines, oil engines, electrical installations and boilers are given in Pt 1, Ch 3, 12 Turbines and steam engines - Detailed requirements, Pt 1, Ch 3, 13 Reciprocating internal combustion engines - Detailed requirements, Pt 1, Ch 3, 14 Electrical equipment and Pt 1, Ch 3, 15 Boilers

respectively. In certain instances, upon application by the Owner or where indicated by the maker's servicing recommendations, the Committee will give consideration to the circumstances where deviation from these detailed requirements is warranted, taking account of design, appropriate indicating equipment (e.g. vibration indicators) and operational records.

11.2.12 For **natural gas fuel installations** see also Pt 1, Ch 3, 23.8 Complete Surveys – General requirements and Pt 1, Ch 3, 23.9 Complete Surveys – Natural gas fuelled consumers and other equipment.

■ *Section 12*

Turbines and steam engines - Detailed requirements

12.1 Complete Surveys

12.1.1 The requirements of Pt 1, Ch 3, 11 Machinery surveys - General requirements are to be complied with.

12.1.2 The working parts of the main engine and attached pumps, and of auxiliary machinery used for essential services, are to be opened out and examined, including:

(a) For reciprocating engines:

- Bulkhead stop valves and manoeuvring valves.
- Cylinders.
- Pistons, piston rods, connecting rods, crossheads and guides.
- Valves and valve gear.
- Crankshaft.

(b) For turbine machinery:

- Blading and rotors.
- Flexible couplings.
- Casings.

12.1.3 In gas turbines and free piston gas generators, the following parts, also, are to be opened out and examined:

- Impellers or blading.
- Rotors and casings of the air compressors.
- Combustion chambers and burners.
- Intercoolers and heat exchangers.
- Gas and air piping, and fittings.
- Starting and reversing arrangements.

12.1.4 Where gas turbines operate in conjunction with free piston gas generators, the following parts of the latter are to be opened out and examined:

- Gas and air compressor cylinders and pistons.
- Compressor end covers.
- Valves and valve gear.
- Fuel pumps and fittings.
- Synchronizing and control gear.
- Cooling system.
- Explosion relief devices.
- Gas and air piping.
- Receivers and valves, including by-pass arrangements.

12.1.5 Condensers, steam reheaters, desuperheaters which are not incorporated in the boilers, and any other appliances used for essential services, are to be examined to the satisfaction of the Surveyor and, if it is considered necessary, they are to be tested.

12.1.6 The manoeuvring of the engines is to be tested under working conditions.

12.1.7 Exhaust steam turbines supplying power for main propulsion purposes in conjunction with reciprocating engines together with their gearing and appliances, steam compressors or electrical machinery, are to be examined, so far as practicable. Where cone connections to internal gear shafts are fitted, the coned ends are to be examined, so far as practicable.

12.1.8 In ships having essential auxiliary machinery driven by oil engines, the prime movers of these auxiliaries are to be examined as detailed in Pt 1, Ch 3, 13 Reciprocating internal combustion engines - Detailed requirements.

■ *Section 13*

Reciprocating internal combustion engines - Detailed requirements

13.1 Scope

13.1.1 The requirements of this Section are applicable to reciprocating internal combustion engines, operating on liquid, gas or dual fuel, providing power for services essential to the safety of the vessel.

13.2 Complete Surveys

13.2.1 The requirements of Pt 1, Ch 3, 11 Machinery surveys - General requirements are to be complied with.

13.2.2 The following parts are to be opened out and examined:

- Cylinders and covers.
- Pistons, piston rods, connecting rods, crossheads and guides.
- Valves and valve gear.
- Crankshafts and all bearings.
- Crankcases, bedplates and entablatures.
- Crankcase door fastenings, explosion relief devices and scavenge relief devices.
- Scavenge pumps, scavenge blowers, superchargers and their associated coolers.
- Air compressors and their intercoolers.
- Filters and/or separators and safety devices.
- Fuel pumps and fittings.
- Camshaft drives and balancer units.
- Vibration dampers or detuners.
- Flexible couplings and clutches.
- Reverse gears.
- Attached pumps and cooling arrangements.

13.2.3 Selected pipes in the starting air system are to be removed for internal examination and are to be hammer tested. If any appreciable amount of lubricating oil is found in the pipes, the starting air system is to be thoroughly cleaned internally by steaming out, or other suitable means. Some of the pipes selected are to be those adjacent to the starting air valves at the cylinders and to the discharges from the air compressors.

13.2.4 The electric ignition system, if fitted, is to be examined and tested.

13.2.5 The manoeuvring of engines is to be tested under working conditions. Initial starting arrangements are to be tested.

13.2.6 Where steam is used for essential purposes, the condensing plant, feed pumps and fuel oil burning plant are to be examined and the steam pipes examined and tested as detailed in Pt 1, Ch 3, 16 Steam pipes.

■ *Section 14* **Electrical equipment**

14.1 Annual and Intermediate Surveys

14.1.1 The electrical contacts of air circuit-breakers are to be visually inspected and maintained in accordance with the manufacturer's recommendations by suitably qualified and trained personnel. Appropriate maintenance records are to be made available to the attending Surveyor on request.

14.1.2 The requirements of Pt 1, Ch 3, 2.2 Annual Surveys and Pt 1, Ch 3, 3.2 Intermediate Surveys are to be complied with as far as applicable.

14.2 Complete Surveys

14.2.1 An electrical insulation resistance test is to be made on the electrical equipment and cables. The installation may be sub-divided, or equipment which may be damaged disconnected, for the purpose of this test.

14.2.2 The fittings on the main and emergency switchboard, section boards and distribution boards are to be examined and over-current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.

14.2.3 Generator circuit-breakers are to be tested, so far as practicable, to verify that protective devices including preference tripping relays, if fitted, operate satisfactorily.

14.2.4 Air circuit-breakers for essential or emergency services and rated at 800 A and above are to be surveyed to ensure that the manufacturer's recommended number of switching operations has not been exceeded. See Pt 6, Ch 2, 7.3 Circuit-breakers. Where a breaker is not fitted with an automatic counter, a written record is to be kept.

14.2.5 The electric cables are to be examined, so far as practicable, without undue disturbance of fixtures or casings, unless opening up is considered necessary as a result of observation or of the tests required by Pt 1, Ch 3, 14.2 Complete Surveys.

14.2.6 The generator prime movers are to be surveyed as required by Pt 1, Ch 3, 12 Turbines and steam engines - Detailed requirements and Pt 1, Ch 3, 13 Reciprocating internal combustion engines - Detailed requirements and the governing of the engines tested. The motors concerned with essential services together with associated control and switch gear are to be examined and, if considered necessary, are to be operated, so far as practicable, under working conditions. All generators and steering gear motors are to be examined and are to be operated under working conditions, though not necessarily under full load or simultaneously.

14.2.7 Where transformers associated with supplies to essential services are liquid-immersed, the Owner is to arrange for samples of the liquid to be taken and tested for dissolved gases, breakdown voltage, acidity and moisture by a competent testing authority, in accordance with the equipment manufacturer's requirements, and a certificate giving the test results is to be made available to the Surveyor on request.

14.2.8 Navigation light indicators are to be tried under working conditions, and correct operation on the failure of supply or failure of navigation lights is to be verified.

14.2.9 The emergency sources of electrical power, their automatic arrangements and associated circuits are to be tested.

14.2.10 Emergency lighting, transitional emergency lighting, supplementary emergency lighting, general emergency alarm and public address systems are to be tested as far as practicable.

14.2.11 Where the ship is electrically propelled, the propulsion motors, generators, propulsion transformers, propulsion conversion equipment, cables, harmonic filters, neutral earthing resistors, dynamic braking resistors and all ancillary electrical equipment that forms part of the propulsion drive and control system, exciters and ventilating plant (including coolers) associated therewith are to be surveyed, and the insulation resistance to earth is to be tested. Special attention is to be given to windings, commutators and slip-rings. Where practicable, the low voltage and high voltage windings of cast resin propulsion transformers are to be subjected to boroscopic inspection, to assess the physical condition of their insulation and for signs of mechanical and thermal damage. The operation of protective gear and alarm devices is to be checked, so far as practicable. Insulating oil, if used, is to be tested in accordance with Pt 1, Ch 3, 14.2 Complete Surveys. Interlocks intended to prevent unsafe operations or unauthorised access are to be checked to verify that they are functioning correctly. Emergency overspeed governors are to be tested.

14.2.12 A General Examination of the electrical equipment in areas which may contain flammable gas or vapour and/or combustible dust is to be made to ensure that the integrity of the safe-type electrical equipment has not been impaired owing to

corrosion, missing bolts, etc. and that there is not an excessive build-up of dust on or in dust protected electrical equipment. Cable runs are to be examined for sheath and armouring defects, where practicable, and to ensure that the means of supporting the cables are in good order. Tests are to be carried out to demonstrate the effectiveness of bonding straps for the control of static electricity. Alarms and interlocks associated with pressurized equipment or spaces are to be tested for correct operation.

14.2.13 For ships having an **OPS** notation assigned, the onshore power supply arrangements are to be examined and functionally tested whilst connected to an external electrical power supply in accordance with approved test schedules (see Pt 7, Ch 13 On-shore Power Supplies) during the Complete Surveys of machinery or, where it is not practical to provide the facilities and operations for testing during the required Surveys of other machinery items, within 12 months of the due date of the Complete Surveys of machinery.

14.3 Docking Surveys

14.3.1 For tankers five years old and over, Pt 1, Ch 3, 14.2 Complete Surveys is to be complied with. In addition, an electrical insulation resistance test of the circuits terminating in, or passing through, the hazardous zones and spaces is to be carried out.

■ **Section 15** **Boilers**

15.1 Frequency of surveys

15.1.1 All boilers, economizers, steam receivers, steam heated steam generators, thermal oil and hot water units intended for essential services, together with boilers used exclusively for non-essential services having a working pressure exceeding 3,5 bar and a heating surface exceeding 4,5 m² are to be surveyed internally. There is to be a minimum of two internal examinations during each five-year Special Survey cycle. The interval between any two such examinations is not to exceed 36 months. A general external examination is to be carried out at the time of the Annual Survey.

15.1.2 Consideration may be given in exceptional circumstances to an extension of the internal examination of the boiler not exceeding three months beyond the due date. The extension may be granted after the following is satisfactorily carried out:

- (a) External examination of the boiler.
- (b) Examination and operational test of the boiler safety valve relieving gear (easing gear).
- (c) Operational tests of the boiler protective devices.
- (d) Review of the following records since the previous boiler survey:
 - Operation
 - Maintenance
 - Repair history
 - Feedwater chemistry.

In this context 'exceptional circumstances' means unavailability of repair facilities, essential materials, equipment or spare parts, or delays incurred by action taken to avoid severe weather conditions.

15.1.3 An external survey of boilers including tests of safety and protective devices, and tests of safety valves using their relieving gear, is to be carried out annually within the range dates of the Annual Survey of the ship. For exhaust gas heated economizers, the safety valves are to be tested by the Chief Engineer at sea within the range dates of the Annual Survey. This test is to be recorded in the log book and reviewed by the attending Surveyor prior to crediting the Annual Survey.

15.2 Scope of surveys

15.2.1 At the surveys described in Pt 1, Ch 3, 15.1 Frequency of surveys, the boilers, superheaters, economizers and air heaters are to be examined internally on the water-steam side and the fire side. Where considered necessary, the pressure parts are to be tested by hydraulic pressure and the thicknesses of plates and tubes and sizes of stays are to be ascertained to determine a safe working pressure. The safety valves and principal mountings on boilers, superheaters and economizers are to be examined and opened up as necessary by the Surveyor. The adjustment of safety valves is to be verified during each boiler internal survey. Boiler safety valves and their relieving gear are to be examined and tested to verify their satisfactory operation. Safety valves are to be set under steam to a pressure not greater than the approved design pressures of the respective parts. As a working tolerance, the setting is acceptable, provided that the valves lift at not more than 103 per cent of the approved design

pressure. However, for exhaust gas heated economizers, if steam cannot be raised in port, the safety valves may be set by the Chief Engineer at sea, and the results recorded in the log book and reviewed by the attending Surveyor. The following records since the previous Boiler Survey are to be reviewed as part of the survey:

- Operation
- Maintenance
- Repair history
- Feedwater chemistry.

The remaining mountings are to be examined externally and, if considered necessary by the Surveyor, are to be opened up for internal examination. Collision chocks, rolling stays and boiler stools are to be examined and maintained in an efficient condition.

15.2.2 In addition to the foregoing, in exhaust gas heated economizers of the shell type, all accessible welded joints are to be subjected to a visual examination in order to identify any evidence of cracking. Non-destructive testing may be required for this purpose and may be requested by the Surveyor.

15.2.3 In fired boilers employing forced circulation, the pumps used for this service are to be opened and examined at each Boiler Survey.

15.2.4 The fuel oil burning system is to be examined under working conditions and a General Examination made of fuel tank valves, pipes, deck controlgear and oil discharge pipes between pumps and burners.

15.2.5 At each survey of a cylindrical boiler which is fitted with smoke tube superheaters, the saturated steam pipes are to be examined as detailed in Section 16.

15.2.6 At the annual General Examination referred to in Pt 1, Ch 3, 15.1 Frequency of surveys the requirements of Pt 1, Ch 3, 2.2 Annual Surveys to Pt 1, Ch 3, 2.2 Annual Surveys are to be complied with.

■ **Section 16** **Steam pipes**

16.1 Frequency of surveys

16.1.1 Saturated steam pipes, as well as superheated steam pipes where the temperature of the steam at the superheater outlet is not over 450°C, are to be surveyed 10 years from the date of build (or installation) and thereafter at five-yearly intervals.

16.1.2 Superheated steam pipes where the temperature of the steam at the superheater outlet is over 450°C are to be surveyed five years from the date of build (or installation) and thereafter at five-yearly intervals.

16.1.3 At 10 years from the date of build (or installation) and thereafter at five-yearly intervals, all copper or copper alloy steam pipes over 76 mm external diameter supplying steam for essential services at sea, are to be hydraulically tested to twice the working pressure.

16.2 Scope of surveys

16.2.1 At each survey, a selected number of main steam pipes, also of auxiliary steam pipes, which:

- (a) are over 76 mm external diameter,
- (b) supply steam for essential services at sea, and
- (c) have bolted joints,

are to be removed for internal examination and are to be hydraulically tested to 1,5 times the working pressure. If these selected pipes are found satisfactory in all respects, the remainder need not be tested. So far as practicable, the pipes are to be selected for examination and hydraulic test in rotation, so that in the course of surveys all sections of the pipeline will be tested.

16.2.2 Where main and/or auxiliary steam pipes of the category described in Pt 1, Ch 3, 16.2 Scope of surveys and Pt 1, Ch 3, 16.2 Scope of surveys have welded joints between the lengths of pipe and/or between pipes and valves, the lagging in way of the welds is to be removed, and the welds examined and, if considered necessary by the Surveyor, crack detected. Pipe ranges having welded joints are to be hydraulically tested to 1,5 times the working pressure. Where lengths having ordinary bolted joints are fitted in such pipe ranges and can be readily disconnected, they are to be removed for internal examination and hydraulically tested to 1,5 times the working pressure.

16.2.3 Where, on cylindrical boilers having smoke tube superheaters, the saturated steam pipes adjoining the saturated steam headers are situated partly in the boiler smoke boxes, all such pipes adjoining and cross-connecting these headers in the smoke boxes are, at the surveys required by Pt 1, Ch 3, 16.1 Frequency of surveys, to be included in the pipes selected for examination and testing, as defined in Pt 1, Ch 3, 16.2 Scope of surveys. Where the saturated steam pipes inside the smoke boxes consist of steel castings of substantial construction, these requirements need only be applied to a sample casting. Where steel castings are not fitted, the Surveyor is to satisfy himself of the condition of the ends of the saturated steam pipes in the smoke boxes at each Boiler Survey and, if he considers it necessary, a sample pipe is to be removed for examination.

16.2.4 At the surveys specified in Pt 1, Ch 3, 16.1 Frequency of surveys, any of the copper or copper alloy pipes, such as those having expansion or other bends, which may be subject to bending and/or vibration, also closing lengths adjacent to steam-driven machinery, are to be annealed before being tested.

16.2.5 Where it is inconvenient for the Owner to fulfill all the requirements of a Steam Pipe Survey at its due date, the Committee will be prepared to consider postponement of the survey, either wholly or in part.

■ *Section 17*

Screwshafts, tube shafts and propellers

17.1 Frequency of surveys

17.1.1 Shafts with keyed propeller attachments and fitted with continuous liners or approved oil glands, or made of approved corrosion resistant materials, are to be surveyed at intervals of five years when the keyway complies fully with the present Rules.

17.1.2 Shafts having keyless-type propeller attachments are to be surveyed at intervals of five years, provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.

17.1.3 Shafts having solid coupling flanges at the after end are to be surveyed at intervals of five years, provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.

17.1.4 All other shafts not covered by Pt 1, Ch 3, 17.1 Frequency of surveys to Pt 1, Ch 3, 17.1 Frequency of surveys are to be surveyed at intervals of $2\frac{1}{2}$ years.

17.1.5 Controllable pitch propellers for main propulsion purposes are to be surveyed at the same intervals as the screwshaft.

17.1.6 Directional propeller and podded propulsion units for main propulsion purposes are to be surveyed at intervals not exceeding five years.

17.1.7 Water jet units for main propulsion purposes are to be surveyed at intervals not exceeding five years, provided the impeller shafts are made of approved corrosion resistant material or have approved equivalent arrangements.

17.1.8 Dynamic positioning and/or thruster-assisted mooring and athwartship thrust propellers and shaftings are to be surveyed at intervals not exceeding five years.

17.2 Normal surveys

17.2.1 All screwshafts are to be withdrawn for examination by LR's Surveyors at the intervals prescribed in Pt 1, Ch 3, 17.1 Frequency of surveys to Pt 1, Ch 3, 17.1 Frequency of surveys. The after end of the cylindrical part of the shaft and the forward one-third of the shaft cone, or fillet of the flange, are to be examined by a magnetic particle crack detection method. In the case of a keyed propeller attachment, at least the forward one-third of the shaft cone is to be examined with the key removed. Wear down is to be measured and the stern tube bearings, oil glands, propellers and fastenings are to be examined. Controllable pitch propellers where fitted are to be opened up and the working parts examined, together with the control gear.

17.2.2 Directional propeller and podded propulsion units, inclusive of the propellers, shafts, gearing, control gear and the primary electrical components including any control and protection devices, are to be dismantled if considered necessary and generally examined as far as practicable.

17.2.3 Water jet units, including the impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlet channels, steering nozzle, reversing arrangements, and control gear are to be generally examined so far as practicable.

17.2.4 Dynamic positioning and/or thruster-assisted mooring and athwartship thrust propellers are to be generally examined so far as possible in dry dock and tested under working conditions afloat for satisfactory operation. All accessible parts, including sealing, locking and bearing faces, and any other moving parts are to be examined. Non-destructive examination is to be carried

out as considered necessary by the Surveyor on blade/fin roots. Consideration may be given to condition monitoring schemes for determining the condition of the unit.

17.2.5 Podded propulsion unit screwshaft roller bearings are to be renewed when the calculated life at the maximum continuous rating no longer exceeds the survey interval. See Pt 5, Ch 9, 6.3 Propulsion shafting.

17.2.6 Stationary supporting structure and any erosion protection inserts or doublers are to be examined in way of any propulsion devices.

17.3 Screwshaft Condition Monitoring (SCM)

17.3.1 Monitoring records are to be reviewed at annual survey for all vessels assigned the ShipRight descriptive note SCM (Screwshaft Condition Monitoring). The records that are to be maintained for oil and water lubricated bearings are detailed in the following Sections.

17.3.2 Oil lubricated bearing records are to be available on board that include the following:

(a) Lubricating oil analysis to be carried out regularly at intervals not exceeding six months. Each analysis is to include the following minimum parameters:

- water content,
- chloride content,
- bearing material and metal particles content,
- oil ageing (resistance to oxidation) , minimum testing to include Viscosity and Total Acid Number (TAN).

Note Oil samples are to be taken under service conditions and are to be representative of the oil within the sterntube.

(b) Oil consumption.

(c) Bearing temperatures.

17.3.3 Further information is provided in the LR document *ShipRight Procedure Machinery Planned Maintenance and Condition Monitoring*.

17.3.4 Water lubricated bearing records are to be available on board that include the following:

- (a) A record of variations in the flow rate of lubricating water.
- (b) A record of variations in the shaft power transmission.
- (c) Wear monitoring records for the sternbush.
- (d) For open loop systems the records from equipment for continuous monitoring of water sediment or alternatively records from a LR approved extractive sampling and testing procedure are to be available on board.

Records of cleaning and replacement of lubrication filters/separators are to be maintained on board. The pumping and water filtration system is to be considered part of the continuous survey cycle and is to be subject to a Periodical Survey.

(e) For closed cycle water systems the records from water analysis results carried out regularly at intervals not exceeding six months are to be retained on board. The analysis is to include the following parameters:

- (i) Chloride content
- (ii) Bearing material and metal particles content.

Note Samples are to be taken under service conditions and are to be representative of the water circulating within the sterntube.

Note Records of cleaning and replacement of lubrication filters/separators are to be maintained on board. The pumping and water filtration system is to be considered part of the continuous survey cycle and is to be subject to a Periodical Survey.

17.3.5 For maintenance of the descriptive note **SCM**, the records of all data collected in Pt 1, Ch 3, 17.3 Screwshaft Condition Monitoring (SCM) and Pt 1, Ch 3, 17.3 Screwshaft Condition Monitoring (SCM) are to be retained on board and audited by LR annually.

17.3.6 Where the requirements for the descriptive note **SCM** have been complied with, the screwshaft need not be withdrawn at surveys as required by Pt 1, Ch 3, 17.2 Normal surveys, provided all condition monitoring data are found to be within permissible limits and all exposed areas of the shaft are examined by a magnetic particle crack detection method or an alternative approved means for shafts with a protective liner or coating Pt 5, Ch 6, 4.1 Screwshaft Condition Monitoring (SCM). The remaining requirements of Pt 1, Ch 3, 17.2 Normal surveys are to be complied with. Where the Attending Surveyor considers that the data presented is not sufficient to determine the condition of the shaft, the shaft may be required to be withdrawn in accordance with Pt

Periodical Survey Regulations

Part 1, Chapter 3

Section 18

1, Ch 3, 17.2 Normal surveys. For water lubricated bearings, the screwshaft is to be withdrawn for examination, as Pt 1, Ch 3, 17.2 Normal surveys, when the ship reaches 18 years from the date of build or the third Special Survey, whichever comes first.

17.4 Modified Survey

17.4.1 A Modified Survey may be accepted at alternate five-yearly surveys for shafts described in Pt 1, Ch 3, 17.1 Frequency of surveys, provided they are fitted with oil lubricated bearings and approved oil glands, and also for those in Pt 1, Ch 3, 17.1 Frequency of surveys and Pt 1, Ch 3, 17.1 Frequency of surveys.

17.4.2 The Modified Survey is to consist of the partial withdrawal of the shaft, sufficient to ascertain the condition of the stern bearing and shaft in way. For keyless propellers or shafts with a solid flange connection to the propeller, a visual examination to confirm the good condition of the sealing arrangements is to be made. The oil glands are to be capable of being replaced without removal of the propeller. The forward bearing and all accessible parts, including the propeller connection to the shaft, are to be examined as far as possible. Wear down is to be measured and found satisfactory. Where a controllable pitch propeller is fitted, at least one of the blades is to be dismantled complete for examination of the working parts and the controlgear.

17.4.3 For keyed propellers, the after end of the cylindrical part of the shaft and forward one-third of the shaft cone is to be examined by a magnetic particle crack detection method, for which dismantling of the propeller and removal of the key will be required.

17.4.4 Where the requirements for the descriptive note **SCM** have been complied with, as described in Pt 1, Ch 3, 17.3 Screwshaft Condition Monitoring (SCM) and all data are found to be within permissible limits, partial withdrawal of the shaft will not be required. Where doubt exists regarding any of the above findings, the shaft is to be withdrawn to permit an entire examination.

17.5 Partial Survey

17.5.1 For shafts where the Modified Survey is applicable, upon application by the Owner, the Committee will be prepared to give consideration to postponement of the survey for a maximum period of half the specified cycle provided a Partial Survey is held.

17.5.2 The Partial Survey is to consist of the propeller being backed off in any keyed shaft and the top half of the cone examined by an efficient crack detection method for which the removal of the key will be required. On ships less than 15 years old, propellers with keyless connections to the screwshaft are not required to be backed off. Exposed areas of screwshaft, oil gland and seals are to be examined and dealt with as necessary. Wear down is to be measured, recorded and reviewed at each screwshaft survey and found satisfactory. Propeller and fastenings are to be examined.

17.5.3 The Committee will be prepared to give consideration to the circumstances of any special case upon application by the Owner.

■ Section 18 Inert gas systems

18.1 Frequency of surveys

18.1.1 Inert gas systems installed on board ships intended for the carriage of oil or liquid chemicals in bulk are to be surveyed annually in accordance with the requirements of Pt 1, Ch 3, 2.2 Annual Surveys. A Special Survey of the inert gas system, in accordance with the requirements of Pt 1, Ch 3, 18.2 Scope of surveys, is to be held at intervals not exceeding five years.

18.2 Scope of surveys

18.2.1 At each Special Survey of the inert gas system, the inert gas generator, scrubber and blower are to be opened out as considered necessary and examined. Gas distribution lines and shut-off valves, including soot blower interlocking devices are to be examined as considered necessary. The deck seal and non-return valve are to be examined. Cooling water systems including the effluent piping and overboard discharge from the scrubbers are to be examined. All automatic shutdown devices and alarms are to be tested. The complete installation is to be tested under working conditions on completion of survey.

18.2.2 When, at the request of an Owner, it has been agreed by the Committee that the Complete Survey of the inert gas systems may be carried out on the Continuous Survey basis, the various items of machinery are to be opened for survey in

rotation, so far as practicable, to ensure that the interval between consecutive examinations of each item will not exceed five years. In general, approximately one-fifth of the machinery is to be examined each year.

18.2.3 If any examination during Continuous Survey reveals defects, further parts are to be opened up and examined as considered necessary by the Surveyors, and the defects are to be made good to their satisfaction.

18.2.4 See Pt 1, Ch 3, 9.7 Special Survey I (ships five years old) – General requirements for inert gas systems on ships for liquefied gases.

18.2.5 See Pt 1, Ch 3, 23.3 Annual Surveys – General Requirements for Fuel Systems and Pt 1, Ch 3, 23.7 Intermediate Surveys for inert gas systems on ships with natural gas fuel installations.

■ *Section 19*

Classification of ships not built under survey

19.1 General

19.1.1 When classification is desired for a ship not built under the supervision of LR's Surveyors, application should be made to the Committee in writing.

19.1.2 Periodical Surveys of such ships, when classed, are subsequently to be held as in the case of ships built under survey.

19.1.3 Where classification is desired for a ship which is classed by another recognized Society, special consideration will be given to the scope of the survey.

19.2 Hull and equipment

19.2.1 Plans showing the main scantlings and arrangements of the actual ship, together with any proposed alterations, are to be submitted for approval. These should comprise plans of the midship section, longitudinal section and decks, and such other plans as may be requested. If plans cannot be obtained or prepared by the Owner, facilities are to be given for LR's Surveyor to obtain the necessary information from the ship.

19.2.2 Particulars of the process of manufacture and the testing of the material of construction are to be supplied.

19.2.3 In all cases, the full requirements of Pt 1, Ch 3, 5 Special Survey - General - Hull requirements, Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, Pt 1, Ch 3, 8 Special Survey - Chemical Tankers - Hull requirements, Pt 1, Ch 3, 9 Ships for liquefied gases and Pt 1, Ch 3, 10 Dredgers, hopper dredgers, sand carriers, hopper barges and reclamation craft are to be carried out as applicable. Ships of recent construction will receive special consideration.

19.2.4 During the survey, the Surveyors are to satisfy themselves regarding the workmanship and verify the approved scantlings and arrangements. For this purpose, and in order to ascertain the amount of any deterioration, parts of the structure will require to be gauged as necessary. Full particulars of the anchors, chain cables and equipment are to be submitted. For ships to which Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements applies, fire protection, detection and extinction are to be in accordance with that Chapter. Loading instruments, where required, are to be in accordance with the Rules, see Pt 3, Ch 3, 4.8 Watertight tunnels and passageways as applicable.

19.2.5 When the full survey requirements indicated in Pt 1, Ch 3, 19.2 Hull and equipment and Pt 1, Ch 3, 19.2 Hull and equipment cannot be completed at one time, the Committee may consider granting an interim record for a limited period. The conditions regarding the completion of the survey will depend on the merits of each particular case, which should be submitted for consideration.

19.3 Machinery

19.3.1 To facilitate the survey, plans of the following items (plans of piping are to be diagrammatic), together with the particulars of the materials used in the construction of the boilers, air receivers and important forgings, are to be furnished:

- General pumping arrangements, including air and sounding pipes (Shipbuilder's plan).
- Pumping arrangements at the forward and after ends of oil tankers and drainage of cofferdams and pump rooms.
- General arrangement of cargo piping in tanks and on deck of oil tankers.
- Piping arrangements for cargo oil (F.P. 60°C or above, closed cup test).

-
- Bilge, ballast and fuel oil pumping arrangements in the machinery space, including the capacities of the pumps on bilge service.
 - Arrangement and dimensions of main steam pipes.
 - Arrangement of fuel oil pipes and fittings at settling and service tanks.
 - Arrangement of fuel oil piping in connection with oil burning installations.
 - Fuel oil and cargo oil overflow systems, where these are fitted.
 - Arrangement of boiler feed systems.
 - Fuel oil settling, service and other fuel oil tanks not forming part of the ship's structure.
 - Boilers, superheaters and economizers.
 - Air receivers.
 - Crank, thrust, intermediate and screw shafting.
 - Clutch and reversing gear with methods of control.
 - Reduction gearing.
 - Propeller (including spare propeller if supplied).
 - Electrical circuits.
 - Arrangement of compressed air systems for main and auxiliary services.
 - Arrangement of lubricating oil systems.
 - Arrangement of flammable liquids used for power transmission, control and heating systems
 - Arrangement of cooling water systems for main and auxiliary services.
 - General arrangement of cargo tank vents. The plan is to indicate the type and position of the vent outlets from any superstructure, erection, air intake, etc. Ventilation arrangements of cargo and/or ballast pump rooms and other enclosed spaces which contain cargo handling equipment.

19.3.2 Plans additional to those detailed in Pt 1, Ch 3, 19.3 Machinery are not to be submitted unless the machinery is of a novel or special character affecting classification.

19.3.3 Where remote and/or automatic controls are fitted to propulsion machinery and essential auxiliaries, a description of the scheme is to be submitted.

19.3.4 For new ships and ships which have been in service less than two years, calculations of the torsional vibration characteristics of the propelling machinery are to be submitted for consideration, as required for ships constructed under Special Survey. For older ships, the circumstances will be specially considered in relation to their service record and type of machinery installed. Where calculations are not submitted, the Committee may require that the machinery certificate be endorsed to this effect. When desired by the Owner, the calculations and investigation of the torsional vibration characteristics of the machinery may be carried out by LR upon special request.

19.3.5 The main and auxiliary machinery, feed pipes, compressed air pipes and boilers are to be examined as required at Complete Surveys. Working pressures are to be determined from the actual scantlings in accordance with the Rules.

19.3.6 The screwshaft is to be drawn and examined.

19.3.7 The steam pipes are to be examined and tested as required by Pt 1, Ch 3, 16 Steam pipes.

19.3.8 The bilge, ballast and fuel oil pumping arrangements are to be examined and amended, as necessary, to comply with the Rules.

19.3.9 Oil burning installations are to be examined as required at Complete Surveys and found, or modified, to comply with the requirements of the Rules; they are also to be tested under working conditions.

19.3.10 The electrical equipment is to be examined as required at Complete Surveys.

19.3.11 Where an inert gas system is fitted on ships intended for the carriage of oil in bulk having a flash point not exceeding 60°C, the requirements of Pt 5, Ch 15, 8 Inert gas systems apply.

19.3.12 The whole of the machinery, including essential controls, is to be tried under working conditions to the Surveyor's satisfaction.

19.3.13 First entry reports are to be prepared by the Surveyors.

19.4 Refrigerated cargoes

19.4.1 When classification is desired for an installation not constructed under the supervision of LR's Surveyors, application is to be made to the Committee in writing.

19.4.2 Full particulars and plans are to be forwarded for consideration, together with the particulars of the materials of the crankshafts, pressure vessels and pressure piping. The requirements of Pt 6, Ch 3, 1 General requirements and Pt 6, Ch 3, 4 Refrigeration plant, pipes, valves and fittings are to be used for guidance in regard to the information required.

19.4.3 A special examination is to be made at least to the extent required for subsequent Special Surveys, see Pt 1, Ch 3, 20.3 Subsequent Special Survey.

19.4.4 The thickness and material of the insulation, the particulars of the frames, beams, stiffeners and other steelwork within the insulation, the air coolers and/or chamber grid piping, the compressors, evaporators and condensers are to be verified so far as practicable.

19.4.5 The installation is to conform to the requirements of the relevant Sections of Pt 6, Ch 3 Refrigerated Cargo Installations.

19.4.6 Acceptance tests are to be carried out in accordance with the requirements of Pt 6, Ch 3 Refrigerated Cargo Installations.

■ **Section 20** **Refrigerated cargo installations**

20.1 Annual Surveys

20.1.1 The Surveyors are to examine the machinery under working conditions as soon as practicable after a ship's arrival at a port of discharge before the cargo is unloaded. An examination of the refrigerated cargo installation log book (or other records) is to be made and any breakdowns or malfunctions of the plant during the previous twelve months are to be noted and reported to the Committee.

20.1.2 A General Examination of the refrigerating plant is to be carried out, and satisfactory operation of safety devices, controls and thermometry is to be verified. Insulated cargo spaces are to be inspected, and the condition of insulation, lining, scuppers, hatches, coolers, air ducting and air refreshing arrangements are to be checked. The Surveyors may request opening out of suspected items, or recommend repair or renewal of defective items, as a result of inspection.

20.1.3 A General Examination is to be made of electrical motors driving refrigerant compressors, pumps and fans, together with their controlgear and cables. Random tests for insulation resistance are to be made on the cables, switchgear, motors, etc. and this resistance is to be not less than 1 MΩ between individual conductors and between those conductors and earth. The installation may be subdivided for the purpose of this test, and the Surveyor may at his discretion accept the results of tests carried out by a competent member of staff or contractor.

20.1.4 A survey book or other permanent record is to be kept on board the ship to show the date of examination of the various parts. This is to be available to the Surveyor at all times, and is to be signed by the Surveyor on the occasion of each survey.

20.2 Special Surveys

20.2.1 At the first Special Survey, the examinations outlined below are to be carried out. Where there is a programme of replacement instead of maintenance on board, alternative survey arrangements will be considered. Each case will be given individual consideration.

20.2.2 Detailed internal examination of each reciprocating compressor, opened up for inspection of cylinders, pistons, connection rods, valves, seats, glands, relief devices, filters, lubrication and crankshaft.

20.2.3 For screw-type compressors, the period before opening up may be extended to six years or 25 000 running hours, whichever is the earlier. Examination should be made of rotors, clearances, gearing, etc.

20.2.4 Refrigerant condenser cooling water pumps, including standby pump(s) which may be used on other services, are to be opened up and their working parts exposed.

20.2.5 Primary and secondary refrigerant pumps are to be opened up and their working parts exposed.

20.2.6 The water end covers of condensers are to be removed for examination of the tubes, tubeplates and covers.

20.2.7 In the case of pressure vessels covered by insulation, any evidence of dampness or deterioration of the insulation which could lead to external corrosion of the vessels or their connections is to be investigated.

20.2.8 Sufficient insulation is to be stripped from insulated pressure vessels to allow the condition of the vessels and their connections to be ascertained. Care is to be taken that in replacement of the insulation, the vapour sealing of the outer covering is made good.

20.2.9 Sufficient insulation is to be stripped from pipes carrying the refrigerant at various points of the system both outside and inside the insulated chambers to permit the condition of the pipes to be ascertained. Sections of piping exposed are to include locations where lengths of piping have been connected by screwed couplings or butt welding. Care is to be taken that when ungalvanized portions of the piping in way of joints have been exposed, they are to be suitably coated and taped, after pressure testing, to prevent corrosion. On replacement of the insulation, the vapour sealing of the outer covering is to be made good.

20.2.10 A General Examination is to be made of all pressure relief valves and/or safety discs throughout the refrigerating plant to ensure that they are in good order and covered by current certification. However, no attempt is to be made to test primary refrigerant pressure relief on board ship. Relief valves are to be removed, overhauled and recalibrated every five years or in accordance with the manufacturer's recommendations, whichever is sooner.

20.2.11 Sea connections to refrigerant condenser cooling water pumps are to be opened up on the occasion of the hull and/or main machinery Special Survey.

20.2.12 The electric motors driving refrigerant compressors, pumps and fans, together with their controlgear and cables, are to have their insulation resistance tested and this is to be not less than 1 MΩ between individual conductors and between those conductors and earth. The installation may be subdivided to any desired extent by opening switches, removing fuses or disconnecting appliances for the purpose of this test.

20.2.13 All automatic controls, alarms and safety systems are to be tested and correct operation confirmed.

20.2.14 Sufficient air ducting and insulation lining is to be stripped from the cargo spaces or chamber's overhead and vertical surfaces to allow the condition of the insulation, insulation linings, grounds, supports, hangers and fixtures which support the insulation, grids, meat rails, etc. to be ascertained. Care is to be taken that on replacement, the ducts and linings are sealed against air blowing into the insulation, or against moisture ingress from refrigerated cell or space atmosphere.

20.2.15 Sufficient tank top insulation is to be stripped to allow the condition of the grounds and inner insulation lining to be ascertained.

20.2.16 Due consideration is to be given to the type of insulation used in the cargo spaces and chambers when determining the amount of insulation lining to be removed. Where organic foam insulants have been used, including panel systems or foamed *in situ*, or other insulants in slab form, the removal of panels or linings is to be at the Surveyor's discretion.

20.2.17 Under normal circumstances, the condition of the cargo space and chamber insulation, grounds, etc. can be ascertained when the Special Survey of the ship's steel structure is being held.

20.2.18 Arrangements made for defrosting air coolers, and for draining condensate from trays below coolers, are to be examined to ascertain that they are in working order. Trace heating elements around drain pipes should be specially examined.

20.2.19 Any air refreshing arrangements are to be examined.

20.3 Subsequent Special Survey

20.3.1 A subsequent Special Survey is to be held approximately five years from the date of the previous Special Survey. Where a Continuous Survey procedure has been agreed, the interval between consecutive examinations of each item should not exceed five years.

20.3.2 In addition to the requirements for the first Special Survey as detailed in Pt 1, Ch 3, 20.2 Special Surveys and Pt 1, Ch 3, 20.3 Subsequent Special Survey are to be complied with.

20.3.3 'Shell-and-tube' condensers and evaporators (secondary refrigerant coolers) in which the primary refrigerant is in the shell, are to have the shell pneumatically tested with the refrigerant, or air, or a mixture of inert gas and refrigerant (with the end covers removed) at pressures as stated in Pt 6, Ch 3, 2.5 Design pressures.

20.3.4 Shell-and-tube evaporators (secondary refrigerant coolers) in which the secondary refrigerant is in the shell are to have the shell hydraulically tested (with the end covers removed) to 1,5 times the design pressure, but in no case less than 2,9 bar g. After refitting the end covers, the primary refrigerant side is to be pneumatically tested as stated in Pt 1, Ch 3, 20.3 Subsequent Special Survey, and an examination made as far as practicable for gas leakage in the shell with the secondary refrigerant connection removed.

20.3.5 Heat exchangers used for cooling refrigerant liquid by the suction return gas to a compressor are not subject to internal corrosion, and would normally require to be specially examined internally only if leakage is suspected between high and low pressure sides. This type of heat exchanger, together with others using brine or water, are to be examined and tested at the discretion of the Surveyor according to the design of such equipment.

20.4 Loading Port Surveys

20.4.1 When a Loading Port Certificate is required by the Owner or his representative, a survey as detailed in Pt 1, Ch 3, 20.4 Loading Port Surveys to Pt 1, Ch 3, 20.4 Loading Port Surveys is to be carried out at the loading port. The certificate is not in respect of the cargo to be loaded or the manner in which it is to be stowed.

20.4.2 The refrigerating installation is to be examined under working conditions, and the temperatures in the cargo chambers are to be noted.

20.4.3 A General Examination of the generating plant supplying electric power to the refrigerated cargo installation is to be carried out to confirm that it complies with Pt 6, Ch 3, 6.1 General.

20.4.4 The refrigerated cargo spaces and chambers are to be examined in an empty state to ascertain that they are clean and free from odour which may adversely affect the cargo to be loaded, that the air cooler coils and cooling grids and their connections are free from leakage, that cargo battens, where fixed to the vertical surfaces, are in good order, that cargo gratings or dunnage battens (see Pt 6, Ch 3 Refrigerated Cargo Installations) are available as necessary for the floors or decks, and that no damage has been sustained to the insulation or its lining prior to the loading of the refrigerated cargo. Any indications of defective insulation not considered to warrant immediate attention are to be noted and specially reported.

20.4.5 All scuppers and bilge suction drains insulated spaces are to be examined to ensure that they are in good working order, and that any liquid seals are primed.

20.4.6 If the ship loads at more than one port, one survey only at the first loading port will be required, provided that it includes the examination of all spaces or chambers which are to be used for refrigerated cargo during the voyage, and that general cargo is not subsequently carried in any of the spaces or chambers prior to loading the refrigerated cargo.

20.4.7 In the case of ships engaged on voyages of less than two months' duration, a Loading Port Certificate will be considered as valid for two months, provided that the cargoes carried are of such a nature as not to damage the insulation or appliances in the insulated chambers, nor to affect, by taint or mould, the refrigerated cargoes loaded during that period. For longer voyages, the certificate is valid for only one cargo from the loading port(s) to the discharge port(s).

20.4.8 If there is no LR Surveyor available at the loading port(s), or if none is obtainable from a port within a reasonable distance, the Committee will accept the report of a survey held at the loading port by two competent engineers of the ship.

20.5 Refrigerating plant on ships not classed with LR

20.5.1 In the case of refrigerating installations being constructed under Special Survey on ships not intended to be classed with LR, the installation is to comply with the applicable requirements of Pt 6, Ch 3 Refrigerated Cargo Installations.

20.5.2 The generator engines and electrical equipment, which supply power to the refrigerating installations are to be constructed in accordance with the requirements of the Classification Society concerned and the installation is also to comply with the requirements of Pt 6, Ch 3, 6.1 General. Such plant is to be examined generally and under working conditions by the Surveyors.

■ **Section 21** **Controlled atmosphere systems**

21.1 Retention of class

21.1.1 It is a prerequisite of the **CA** notation that the refrigeration installation on board already conforms to a ✱ **Lloyd's RMC** class notation. see Pt 1, Ch 2, 2.6 Class notations (refrigerated cargo installations (RMC), controlled atmosphere (CA) systems and carriage of refrigerated containers (CRC)).

21.1.2 For the retention of Class, the CA systems are to be submitted for Periodical Surveys by LR's Surveyors as specified in Pt 1, Ch 3, 21.2 Annual Surveys and Pt 1, Ch 3, 21.3 Special Surveys.

Periodical Survey Regulations

Part 1, Chapter 3

Section 22

21.2 Annual Surveys

21.2.1 Annual Surveys are to be carried out from the date of the Initial Classification Survey to verify that the CA system remains satisfactory.

21.2.2 The complete CA installation is to be visually examined and tested for the following main aspects:

- (a) CA zone sealing arrangements including cleats and hinges, pressure/vacuum (P/V) valves, door locks, ventilation of adjacent spaces, warning notices.
- (b) CA zones to be individually tested for airtightness to the design pressure. Testing by ship's staff, within one month prior to the survey may be accepted, based on a written report by the Master subject to visual inspection confirming the airtightness.
- (c) Operation and performance testing of the gas supply equipment, including controls, alarms, interlocks, safety devices.
- (d) Ventilation arrangements including fans.
- (e) Electrical supply arrangements.
- (f) Gas analyzers and analyzing equipment and calibration.
- (g) RH sensors and calibrations.
- (h) Permanent and portable gas monitoring, calibration and personnel safety equipment.
- (i) Witnessing of the air leakage.
- (j) Voyage logs, records of CA zone airtightness and calibration of instruments.
- (k) Verification that an Operating and Safety Manual is on board, is complete and that the responsible officers have countersigned to confirm that they are familiar with its contents.

21.2.3 On satisfactory completion of this survey, a new Annual Survey 'AS', with date, will be assigned.

21.3 Special Surveys

21.3.1 Special Surveys are to be carried out at intervals of five years from the date of the Initial Classification Survey to verify that all machinery, CA zones and safety arrangements remain satisfactory. On request from Owners, all surveyable items may be examined on a continuous basis. With this option, 20 per cent of all items are to be presented for survey annually.

21.3.2 Each CA zone is to be subjected to an airtightness test.

21.3.3 The extent of dismantling is to be at the LR Surveyor's discretion, but is to be sufficient for the Surveyor to be satisfied as to the condition of the installation.

21.3.4 On satisfactory completion of this survey, a new Special Survey 'SS', or 'RMC CS' with date, will be assigned.

■ Section 22

Bow, inner, side shell and stern doors on Ro-Ro ships

22.1 General

22.1.1 The requirements of Pt 1, Ch 3, 2 Annual Surveys - Hull and machinery requirements to Pt 1, Ch 3, 5 Special Survey - General - Hull requirements are to be complied with, as applicable.

22.1.2 The requirements in this Section are applicable to the survey of bow, inner, side shell and stern doors on roll on-roll off passenger (Ro-Pax) ships and roll on-roll off (Ro-Ro) cargo ships.

22.1.3 Annual Survey and Special Survey of bow, inner, side shell and stern doors are to include examinations, tests and checks to a sufficient extent in order to verify that they are in satisfactory condition, remain in compliance with applicable requirements, and are subject to proper maintenance and operation in accordance with the Operation and Maintenance Manual (OMM) or manufacturer's recommendations.

22.2 Definitions

22.2.1 For the application of the requirements in this Section, a **Ro-Ro ship** is a ship that utilises a loading ramp to enable wheeled vehicles to be rolled on and rolled off the ship.

22.2.2 A **Ro-Pax** ship is a passenger ship with Ro-Ro spaces or special category spaces.

22.2.3 **Ro-Ro spaces** are those that extend over a substantial length or the entire length of the ship, and are not normally sub-divided. These spaces can be loaded and unloaded (normally in a horizontal direction) with motor vehicles with fuel in their tanks for their own propulsion and/or goods (either packaged or in bulk, in rail or road cars (including tankers), trailers, containers, pallets, demountable tanks or in other stowage units or receptacles).

22.2.4 **Special category spaces** are enclosed vehicle spaces (above or below the bulkhead deck) that vehicles can be driven on to and from, and that can be accessed by passengers. Special category spaces may be accommodated on more than one deck, provided that the total overall clear height for vehicles does not exceed 10 m.

22.2.5 **Securing devices** are used to keep the door closed by preventing it from rotating about its hinges.

22.2.6 **Supporting devices** are used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.

22.2.7 A **locking device** is used to lock a securing device in the closed position.

22.2.8 A **Close-up Survey** is defined in Pt 1, Ch 3, 1.5 Definitions.

22.3 Annual Surveys

22.3.1 The survey is to consist of an examination to verify, as far as is practicable, that the bow, inner, side shell and stern doors are maintained in a satisfactory condition.

22.3.2 The Surveyor is to obtain confirmation that no unapproved changes have been made to the bow, inner, side shell and stern doors since the last survey.

22.3.3 Where applicable, Surveyors are to verify that the Operation and Maintenance Manual (OMM), including any revisions, is available on board. It is to be verified that documented operating procedures for closing and securing the doors are kept on board and posted at the appropriate place(s). The Surveyor is to apply particular attention to the register of inspections and its contents (contained within the OMM) as a basis for the survey.

22.3.4 An examination of the bow, inner, side shell and stern doors is to be carried out, with particular attention to be applied to the following:

- (a) The structural arrangement of doors, including plating, secondary stiffeners, primary structure, hinging arms and weld connections;
- (b) Shell structure surrounding the opening of the doors and the securing, supporting and locking devices, including shell plating, secondary stiffeners, primary structure and associated weld connections;
- (c) Hinges and bearings, thrust bearings;
- (d) Hull and door side supports for securing, supporting and locking devices.

Note If a crack is identified, an examination by non-destructive testing is to be carried out in the surrounding area and for similar items, as considered necessary by the Surveyor.

22.3.5 A Close-up Survey of the securing, supporting and locking devices is to be carried out. As a minimum, the Close-up Survey is to include the following:

- (a) Cylinder securing pins, supporting brackets, back-up brackets (where fitted) and their weld connections;
- (b) Hinge pins, supporting brackets, back-up brackets (where fitted) and their weld connections;
- (c) Locking hooks, securing pins, supporting brackets, back-up brackets (where fitted) and their weld connections;
- (d) Locking pins, supporting brackets, back-up brackets (where fitted) and their weld connections;
- (e) Locating and stopper devices and their weld connections.

22.3.6 The clearances of hinges, bearings and thrust bearings are to be measured where no dismantling is required. If the function test is not satisfactory, dismantling may be required to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings, together with non-destructive testing of the hinge pin, is to be carried out. The clearances of the securing, supporting and locking devices are to be measured, where indicated in the Operation and Maintenance Manual (OMM).

22.3.7 An examination of the sealing arrangements, including packing material/rubber gaskets, retaining bars or channels and associated weld connections, is to be carried out.

22.3.8 An examination of the drainage arrangements, including bilge wells and drain pipes, where fitted, is to be carried out. A test of the bilge system between the inner and outer doors is to be carried out.

22.3.9 A function test of doors is to be carried out. The Surveyor is to check the satisfactory operation of the bow, inner, side shell and stern doors during a complete opening and closing operation including, as applicable:

- (a) Proper working of the hinging arms and hinges;
- (b) Proper engagement of the thrust bearings;
- (c) Device for locking the door in the open position;
- (d) Securing, supporting and locking devices;
- (e) Proper sequence of the interlock system for the opening/ closing system and the securing and locking devices;
- (f) Mechanical lock of the securing devices;
- (g) Proper locking of hydraulic securing devices in the event of a loss of the hydraulic fluid, according to the procedure contained in the Operation and Maintenance Manual (OMM);
- (h) Correct indication of open/closed position of doors and securing/locking devices at navigation bridge and other control stations;
- (i) Isolation of the hydraulic securing/locking devices from other hydraulic systems;
- (j) Confirmation that the operating panels are inaccessible to unauthorised persons;
- (k) Verification that a notice plate giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour is placed at each operating panel and supplemented by warning indicator lights;
- (l) Examination of electrical equipment for opening, closing and securing the doors.

22.3.10 A function test of the indicator system is to be carried out. The Surveyor is to check the satisfactory operation of the indicator system, where fitted, including the following, as applicable:

- (a) Proper visible indication and audible alarm on the navigation bridge panel, according to the selected function 'harbour/sea voyage' and on the operating panel;
- (b) Lamp test function on both panels;
- (c) Verification that it is not possible to turn off the indicator light on both panels;
- (d) Verification of fail safe performance, according to the procedure contained in the Operation and Maintenance Manual (OMM);
- (e) Confirmation that power supply for the indicator system is supplied by the emergency source or other secure power supply and is independent of the power supply for operating the doors;
- (f) Proper condition of sensors and protection from water, ice formation and mechanical damage.

22.3.11 A test of the water leakage detection system, where fitted, is to be carried out. The test is to include verification of a proper audible alarm on the navigation bridge panel and on the engine control room panel, according to the procedure contained in the Operation and Maintenance Manual (OMM).

22.3.12 A test of the television surveillance system, where fitted, is to be carried out. The test is to include verification of a proper indication on the navigation bridge monitor and on the engine control room monitor.

22.3.13 A hose test, or equivalent, is to be carried out. If the results of the visual examination and function test are satisfactory, the tightness test need not be carried out unless considered necessary by the Surveyor.

22.3.14 Following the visual examinations and function tests, non-destructive testing and thickness measurements may be required as considered necessary by the Surveyor.

22.4 Special Surveys

22.4.1 The requirements of Pt 1, Ch 3, 22.3 Annual Surveys are to be complied with as applicable.

22.4.2 The securing, supporting and locking devices, including their weld connections, are to be subjected to non-destructive testing and thickness measurement to the extent considered necessary by the Surveyor. The maximum allowable diminution is 15 per cent of the as-built thickness.

22.4.3 The effectiveness of the sealing arrangements is to be verified by carrying out a hose test, or equivalent.

22.4.4 The clearances of hinges, bearings and thrust bearings are to be measured. Unless otherwise specified in the Operation and Maintenance Manual (OMM), or by the manufacturer's recommendation, the measurement of clearances may be limited to representative bearings where dismantling is needed in order to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings, together with non-destructive testing of the hinge pin, is to be carried out.

22.4.5 The non-return valves of the drainage system are to be dismantled and examined.

■ Section 23**Natural gas fuel Installations****23.1 General**

23.1.1 The requirements of Pt 1, Ch 3, 11 Machinery surveys - General requirements are to be complied with, as applicable.

23.1.2 In addition to the survey requirements below, further survey requirements may be imposed; as identified during the risk assessment process, see Pt 1, Ch 2, 3.6 Surveys for novel/complex systems, machinery and equipment

23.1.3 This Section provides requirements for the survey of natural gas fuel installations as defined in Pt 1, Ch 3, 1.5 Definitions (natural gas is hereinafter referred to as fuel).

23.1.4 The fuel installation is to be surveyed in working condition except at special survey where internal examination of some components will be required. See Pt 1, Ch 3, 23.8 Complete Surveys – General requirements and Pt 1, Ch 3, 23.9 Complete Surveys – Natural gas fuelled consumers and other equipment.

23.1.5 The Annual Survey should be scheduled, if possible, to coincide with a bunkering operation to allow for verification of fuel storage tank level alarms and bunkering control, alert and safety systems under operational conditions. At annual survey physical testing of alarms and shutdowns is not required unless it is considered necessary by the attending Surveyor. In any case records of the alarms are to be retained for the verification of the attending Surveyor.

23.1.6 The Intermediate Survey supplements the Annual Survey by testing the fuel bunkering system including automatic control, alert and safety systems to confirm satisfactory operation. The extent of the testing required for the Intermediate Survey may briefly interrupt the fuel installation and therefore vessel operations and the survey are to be scheduled accordingly.

23.1.7 The extent of the testing required for Complete Surveys will normally be such that the full survey cannot be carried out with the fuel installation operating or loaded with fuel. Consequently, aspects of the survey should be coordinated to correspond with dry-docking or another period when the system will be gas free. Completion of the survey requires verification of satisfactory condition of the installation at the normal operating temperatures and pressures so will normally be completed once the vessel has been bunkered following reactivation of the system.

23.1.8 Prior to any internal inspection of fuel storage tanks, associated piping, fittings and equipment, etc. the respective items are to be made safe for access by means of isolating relevant valves, purging and gas-freeing the space.

23.1.9 Where an approved condition-monitoring system is employed for the fuel system and its constituent components, and the applicable Descriptive Note is assigned, the requirements of these regulations for opening up and internal examination may be waived where the condition of the equipment can be shown to be within agreed acceptable limits as detailed in Pt 5, Ch 21 Requirements for Condition Monitoring Systems and Machinery Condition-Based Maintenance Systems.

23.1.10 The following documentation, as applicable, is to be available on board the ship:

- (a) Relevant instruction and information such as loading limit curve information, bunkering procedures, cooling down procedures and fuel installation test and inspection procedures.
- (b) Condition-Monitoring or Condition-Based Maintenance documentation as applicable.
- (c) Test records for bunkering ESD systems.
- (d) Records of crew tests/inspections of the fuel installation.

23.1.11 For Special Survey requirements for electrical equipment see Pt 1, Ch 3, 14 Electrical equipment.

23.1.12 Where the design of any part of the natural gas fuel system does not permit opening up for internal examination, as required by these regulations, alternative arrangements for testing and/or inspection will be specially considered.

23.2 Survey Following Repair

23.2.1 Following repair, independent fuel storage tanks of Type C are to be hydrostatically tested in accordance with the manufacturer's test and inspection instructions (normally at 1.25 times the approved maximum vapour pressure). Other types of fuel storage tank, such as membrane tanks, are to be tested in accordance with approved procedures provided by the fuel storage tank designers. After testing, suitable drying and consequent air-purging procedures are to be followed to return the tank to operational condition.

23.3 Annual Surveys – General Requirements for Fuel Systems

23.3.1 The Annual Survey is to be carried out with the fuel installation operational. Gas-freeing will not generally be necessary.

23.3.2 The ship's log and operational records for the fuel installation, covering the period from the previous survey, are to be examined. Any malfunction of the installation recorded in the log is to be investigated. It is to be verified that any repairs have been carried out to an acceptable standard and in accordance with the applicable Rules and Regulations.

23.3.3 Control, alert and safety systems are to be surveyed as follows:

- (a) The control, alert and safety systems for the fuel storage tanks and processing system are to be verified in satisfactory condition by one or more of the following methods:
 - (i) Comparison of read-outs from local and remote indicators.
 - (ii) Consideration of read-outs with regard to the actual conditions.
 - (iii) Examination of maintenance records with reference to the approved maintenance management system.
 - (iv) Verification of calibration status of the measuring instruments.
- (b) All control, alerts and safety systems are to be tested, where testing is not possible due to operational reasons simulated testing may be accepted by the attending Surveyor. Which are to include but are not limited to:
 - (i) fuel storage tank and processing system high and low pressure.
 - (ii) fuel storage tank high and high-high level
 - (iii) fuel storage tank overfill level
 - (iv) fuel storage tank high temperature.
- (c) Fuel leakage detection systems (temperature sensors and gas detection as applicable) are to be examined and tested in accordance with the manufacturer's instructions and calibrated using sample gas.
- (d) The electrical installation, equipment and cables in areas which may contain flammable gas are to be examined in order to verify that they are in good condition and have been properly maintained. Bonding straps that are installed to control static electricity are to be visually examined.
- (e) Alerts and safety systems associated with pressurised installations and any safety device associated with non-safe type electrical equipment that is protected by air-locks or pressurisation, are to be verified.

23.3.4 Fuel installations are to be surveyed as follows:

- (a) Portable and/or fixed drip trays, or insulation providing protection in the event of fuel leakage, are to be examined.
- (b) Components of the fuel installation fitted with insulation to provide protection against ice formation are to be examined for satisfactory condition.
- (c) Fuel piping, valves and fittings are to be generally examined, with particular attention to double-wall or ventilated ducting arrangements, expansion bellows, supports and vapour seals on insulated piping.

23.3.5 Inerting arrangements and associated alarms are to be verified as being in satisfactory condition, including the means for prevention of backflow of fuel vapour to the inert gas system.

23.3.6 Ventilation systems are to be surveyed as follows:

- (a) Ventilation systems and air-locks including their alarm system are to be generally examined.
- (b) Ventilation fans in hazardous areas are to be visually examined.
- (c) For ventilated double-walled piping or ducting containing fuel piping within machinery spaces, exhaust fans and/or supply fans are to be examined to ensure that the air-flow is not impeded.
- (d) Fuel piping and components associated with the fuel processing equipment are to be visually examined.

23.3.7 The closing devices for all air-intakes and openings into accommodation spaces, service spaces, machinery spaces, control stations and approved openings in superstructures and deckhouses less than 10m from deck-mounted fuel storage tanks, are to be examined.

23.3.8 Venting arrangements, including protection screens if provided, for fuel storage tanks, inter-barrier spaces and tank hold spaces as applicable, are to be visually examined externally. The external condition of the fuel storage tank relief valves is to be verified and records of the last test of the opening/closing pressures are to be reviewed.

23.3.9 Means for draining the vent arrangements from fuel storage tank pressure relief valves and other system relief valves are to be examined to ensure that there is no liquid build-up that would impede effective operation, drain valves are to be checked as applicable.

23.3.10 Heating arrangements, if fitted, for steel structures in cofferdams and other spaces are to be verified in satisfactory condition.

23.3.11 All gastight bulkhead penetrations, including any gastight shaft seals, are to be visually examined.

23.4 Annual Surveys – Fuel Processing Equipment

23.4.1 The following fuel processing equipment is to be generally examined in working condition and operational parameters verified. Insulation, where fitted, need not be removed but any deterioration of insulation, or evidence of dampness which could lead to external corrosion of the vessels or their connections, is to be investigated:

- (a) Heat exchangers and pressure vessels.
- (b) Natural gas fuel heaters, vaporisers, masthead heaters.
- (c) Heating arrangements, including provision for continuous heating and circulation of heating medium to prevent freezing during start up and when the fuel installation is not in use.
- (d) Fuel piping and components associated with the fuel processing equipment.

23.4.2 Where the double wall or duct containing fuel piping is protected using a pressurised inert gas atmosphere the monitoring and maintenance of the inert atmosphere is to be confirmed in satisfactory condition.

23.4.3 The condition of the fuel isolation valve and double block and bleed arrangements for each consumer is to be examined with respect to:

- (a) Containment to prevent fuel leakage from any valve arrangements installed within the machinery space.
- (b) Connections to the inerting and venting arrangements.
- (c) General examination to confirm that the valve arrangement and all associated fuel monitoring and control equipment are in satisfactory condition. The external examination is to be supplemented by a review of relevant operational, maintenance and service reports.

23.4.4 Where fuel processing equipment is located within an independent space that functions as containment in the event of a fuel spill (e.g. a tank connection space), the space is to be examined internally and externally to verify that the structure remains in a satisfactory condition to contain any potential leakage of fuel including any thermal isolation to protect the surrounding structure from damage due to cryogenic leakage.

23.4.5 Records of testing the operation of the tank master isolation valve are to be verified. Tests are to be carried out on regular basis as agreed with LR and the scope of the testing should incorporate a full test of the Emergency Shutdown sequence. Where possible, operation of the valve as described above is to be witnessed at the time of survey.

23.5 Annual Surveys – Fuel Storage

23.5.1 Areas in which fuel storage tanks are located (on and below deck) are to be examined for any changes to the arrangements within those areas that may affect the hazardous area rating.

23.5.2 For Type C pressurised fuel storage tanks the external surface of the fuel storage tank insulation is to be visually examined for cold spots to verify the condition of the insulation arrangements. This examination is to be carried out with the fuel storage tanks loaded. Ideally fuel storage tanks should be loaded to the maximum loading limit; examination of partially-filled fuel storage tanks may be accepted alongside a review of records of periodic cold spot examinations carried out by suitably trained and qualified crew.

23.5.3 The supporting structure between the deck plating and the tank is to be examined to confirm that the saddle arrangement remains in satisfactory condition in accordance with the approved design.

23.5.4 For vacuum-insulated fuel storage tanks, monitoring records are to be reviewed to confirm satisfactory maintenance of the vacuum. Any trends identifying a breakdown or loss of vacuum containment are to be investigated.

23.5.5 For Type B fuel storage tanks where the insulation arrangements are such that the insulation cannot be examined, the surrounding structures of wing tanks, double bottom tanks and cofferdams are to be visually examined for cold spots. This examination is to be carried out with the fuel storage tanks loaded. Ideally fuel storage tanks should be loaded to the maximum loading limit; examination of partially-filled fuel storage tanks may be accepted alongside a review of records of periodic cold spot examinations carried out by suitable trained and qualified crew.

23.5.6 For membrane fuel storage tanks the performance of the insulation arrangements is to be confirmed in accordance with approved procedures submitted by the containment designers.

23.6 Annual Survey - Fuel Bunkering System

23.6.1 The fuel-bunkering system, including manifold connections, isolation valves, bunker piping and linked Emergency Shutdown (ESD) system connection equipment (including cabling and connectors), are to be visually examined.

23.6.2 Bunkering operations are to be observed as far as possible; satisfactory condition of the bunkering control, alert and safety system is to be verified. During annual survey it is not expected that ESD1 (stoppage of bunker transfer) or ESD2 (disconnection of bunker piping) will be operationally tested but records of maintenance and testing are to be reviewed. However, prior to starting the bunkering operation, it is expected that an ESD1 is tested with no LNG in the system (i.e. a dry test). Records of the testing are to be available during survey.

23.7 Intermediate Surveys

23.7.1 In addition to the requirements below, the requirements of Pt 1, Ch 3, 23.1 General to Pt 1, Ch 3, 23.6 Annual Survey - Fuel Bunkering System are to be complied with.

- (a) Control, alert and safety systems for the bunkering system, fuel-containment systems and processing equipment, together with any associated shutdown and/or interlock, are to be tested under working conditions and, if necessary, recalibrated. Shutdown sequence and extent are to be verified against documented procedures where applicable. Such safety systems include but are not limited to:
 - (i) Bunkering ESD system is to be tested, without fuel in the piping, to verify that ESD system operation will result in a closure of the isolation valves and a shutdown of machinery associated with bunkering operations. All ESD activations and outputs are to be tested including fuel storage tank overfill protection, bunkering isolation valve closure and automatic shutdown of machinery associated with bunkering operations.
 - (ii) Fuel-processing equipment shutdown and closure of isolation valves resulting from:
 - loss of the valve-actuating medium;
 - loss of ventilation in fuel piping double wall /ventilated duct; or
 - loss of pressure of inert gas in pressurised double-walled pipe arrangement.
 - (iii) Fuel processing equipment shutdown and closure of isolation valves as a result of deviation in the fuel supply to the engine-room from the normal operating conditions (temperature and pressure).
 - (iv) Fuel installation shutdown as a result of gas detection.
 - (v) Safety interlocks on fuel-processing equipment are to be examined and tested as necessary to confirm satisfactory condition.
- (b) A General Examination within the areas deemed as hazardous, such as bunker stations, vent mast area, tank connection space and spaces adjacent to vent arrangements from the tank connection space (if applicable), to verify the electrical arrangements have been maintained satisfactorily for operation in a hazardous environment.
- (c) Verification that piping and independent fuel storage tanks are electrically bonded to the hull.

23.7.2 Consideration will be given to simulated testing, provided that it is considered representative. Comprehensive maintenance records, including details of tests carried out in accordance with the fuel plant and instrumentation maintenance manuals may be presented for review. Acceptance of either simulated testing or maintenance records including reports of testing as described above is subject to the satisfaction of the attending Surveyor.

23.8 Complete Surveys – General requirements

23.8.1 The requirements of Pt 1, Ch 3, 23.1 General to Pt 1, Ch 3, 23.7 Intermediate Surveys are to be complied with.

23.8.2 The items covered by Pt 1, Ch 3, 23.8 Complete Surveys – General requirements to Pt 1, Ch 3, 23.9 Complete Surveys – Natural gas fuelled consumers and other equipment may, at the request of the Owner, be examined on a Continuous Survey basis provided that the interval between examinations of each item does not exceed five years. Exceptions may be made to this requirement if Condition Based Maintenance arrangements have been agreed and maintained satisfactorily (see Pt 1, Ch 3, 23.1 General).

23.8.3 Except where alternative provisions are given in Pt 1, Ch 3, 23.8 Complete Surveys – General requirements and Pt 1, Ch 3, 23.8 Complete Surveys – General requirements below, all fuel storage tanks are to be examined externally and internally, particular attention being paid to the plating in way of supports of securing arrangements for independent tanks, pipe connections, also to sealing arrangements in way of the deck penetrations. Insulation is to be removed as required.

23.8.4 Provided that the structural examination is satisfactory, that the gas detection systems have been found to be in satisfactory condition, routine on board checks and maintenance records are satisfactory and that the voyage records have not

shown any abnormal operation, fuel storage tanks will not require hydrostatic testing (except as required by Pt 1, Ch 3, 23.8 Complete Surveys – General requirements).

23.8.5 The non-destructive testing (NDT) of independent fuel storage tanks is to supplement visual inspection with particular attention to be given to the integrity of the main structural members, tank shell and highly-stressed parts, including welded connections as deemed necessary by the Surveyor. The following items are considered as highly-stressed parts:

- structure in way of tank supports and anti-rolling/anti-pitching devices,
- web frames or stiffening rings,
- swash bulkhead boundaries,
- dome and sump connections to tank shell,
- foundations for pumps, towers, ladders, etc.
- pipe connections.

23.8.6 The NDT testing requirements for different types of independent fuel storage tanks are detailed below; where radiographic or ultrasonic testing is required, at least 10 per cent of the length of the applicable welded connections is to be tested. This testing is to be carried out internally and externally as applicable. Insulation is to be removed as necessary for the required non-destructive testing:

- (a) For independent fuel storage tanks of Type B, the extent of non-destructive testing is to be given in the test schedule specially prepared for the tank design. The Owner is to submit proposals for the extent of non-destructive testing of the fuel storage tanks in advance of the survey.
- (b) For vacuum-insulated independent fuel storage tanks of Type C vacuum monitoring is accepted as a demonstration of the internal integrity of the tank. This is subject to verification that the monitoring equipment is being maintained, operated and calibrated in a satisfactory condition. There is no further requirement for internal examination and testing of these tanks. The tank support arrangements are to be visually examined; non-destructive testing may be required if the condition raises doubt as to the structural integrity.
- (c) For non-vacuum insulated independent fuel storage tanks of Type C non-destructive testing is required on the plating in way of supports and also over selected lengths of welds. Where such testing raises doubt as to the structural integrity, further testing is to be carried out in accordance with the requirements of the manufacturer's test and inspection instructions for hydraulic testing (normally at 1,25 times the approved maximum vapour pressure). Alternatively, consideration will be given to pneumatic testing under special circumstances, provided full details are submitted for approval.
- (d) At each alternate Complete Survey (i.e. at 10 year intervals); non-vacuum insulated independent fuel storage tanks of Type C are to be either:
 - (i) Hydrostatically or hydro-pneumatically tested to not less than 1,25 times MARVS in accordance with the requirements of the manufacturer's test and inspection instructions. The requirements for non-destructive testing in Pt 1, Ch 3, 23.8 Complete Surveys – General requirements are to be carried out following this test as required by the Surveyor; or
 - (ii) Subject to a thorough, planned, non-destructive testing. This testing is to be carried out in accordance with a test schedule specially prepared for the tank design. If a special programme does not exist, the following should be tested:
 - structure in way of tank supports and anti-rolling/anti-pitching devices;
 - stiffening rings;
 - Y-connections between tank shell and a longitudinal bulkhead of bi-lobe tanks;
 - swash bulkhead boundaries if applicable;
 - dome and sump connections to the tank shell if applicable;
 - pipe connections.

23.8.7 Membrane fuel storage tank surveys are to be carried out in accordance with approved testing procedures provided by the containment designers.

23.8.8 Fuel storage tank pipe connections and fittings are to be examined, and all valves and cocks in direct communication with the interiors of the tanks are to be opened out for inspection and the connection pipes are to be examined internally, so far as practicable. Special attention is to be paid to the fuel storage tank master isolation valve(s); the valve seat is to be visually examined and the valve tested at the maximum working pressure of the fuel storage tank prior to re-commissioning the fuel system.

23.8.9 Relief valves are to be surveyed as follows:

- (a) The pressure relief valves for the fuel storage tanks are to be opened for examination, adjusted to the correct operating pressure as indicated in Pt 1, Ch 3, 23.8 Complete Surveys – General requirements, function-tested, and sealed. If the tanks

are equipped with relief valves with non-metallic membranes in the main or pilot valves, such non-metallic membranes are to be replaced. Valves may be removed from the tank for the purpose of making this adjustment under pressure of air or other suitable gas. If valves are removed, the tank and fuel piping downstream of the tank isolation valves are to be gas-freed and inerted.

- (b) Valves are to lift at a pressure not more than the percentage given below, above the maximum vapour pressure for which the tanks have been approved:
 - For 0 to 1,5 bar, 10 per cent.
 - For 1,5 to 3,0 bar, 6 per cent.
 - For pressures exceeding 3,0 bar, 3 per cent.
- (c) Where a detailed record of continuous overhaul and retesting of individually-identifiable relief valves is maintained, consideration will be given to acceptance on the basis of opening, internal examination, and testing of a representative sampling of valves, including each size and type of relief valve in use, provided there is logbook evidence that the remaining valves have been overhauled and tested since the previous Complete Survey.
- (d) Relief valves on fuel piping are to have their pressure settings checked. The valves may be removed from the piping for this purpose. At the Surveyor's discretion a sample of each size and type of valve may be opened for examination and testing.

23.8.10 All fuel pumps, booster pumps and vapour pumps are to be opened out for examination. Where applicable, pumping systems for inter-barrier spaces are to be checked and verified to be in satisfactory condition.

23.8.11 Piping for the fuel processing system including valves, actuators and compensators is to be opened for examination. Insulation may need to be removed, as deemed necessary, to ascertain the condition of the piping. If any doubt exists regarding the integrity of the piping based upon visual examination then, where deemed necessary by the Surveyor, a pressure test at 1,25 times MARVS of the piping is to be carried out. The complete piping systems are to be tested for leaks after re-assembly.

23.8.12 Equipment for the production of inert gas is to be examined and shown to be in satisfactory condition, operating within the gas specification limits. Piping, valves, etc. for the distribution of the inert gas are to be generally examined. Pressure vessels for the storage of inert gas are to be examined internally and externally and the securing arrangements are to be specially examined. Pressure relief valves are to be demonstrated to be in satisfactory condition. Liquid nitrogen storage vessels are to be examined, so far as practicable, and all control equipment, alarms and safety devices are to be verified as operational.

23.8.13 Gastight bulkhead shaft seals are to be opened out so that the sealing arrangements may be checked.

23.8.14 Any sea connections associated with the fuel handling equipment are to be opened out when the ship is in dry dock.

23.8.15 Where an approved condition-monitoring system or condition-based maintenance system is in place, the requirements for opening up of equipment may be reduced accordingly where the condition of the equipment can be shown to be within agreed acceptable limits as detailed in Pt 5, Ch 21 Requirements for Condition Monitoring Systems and Machinery Condition-Based Maintenance Systems.

23.8.16 Testing of the tank connection space and cofferdam leakage-detection arrangement (temperature sensors and gas detectors) is to be carried out.

23.8.17 An electrical insulation resistance test of the circuits terminating in, or passing through, hazardous areas, is to be carried out. If the ship is not in a gas-free condition, the results of previously recorded test readings may be accepted together with a review of the on-board monitoring of the earth loop impedance of relevant circuits.

23.9 Complete Surveys – Natural gas fuelled consumers and other equipment

23.9.1 Heat exchangers associated with the fuel installation are to be opened out and examined as follows:

- (a) The water end covers of evaporators are to be removed for examination of the tubes, tube plates and covers.
- (b) Heating medium pumps, including standby pump(s) which may be used on other services, are to be opened out for examination.
- (c) Where a pressure vessel is insulated, sufficient insulation is to be removed, especially in way of connections and supports, to enable the vessel's condition to be ascertained.

Note this refers to external insulation, not additional insulation that may be installed in the annular space of a vacuum insulated tank.

- (d) Insulated piping is to have sufficient insulation removed to enable its condition to be ascertained. Vapour seals are to be specially examined for their condition. Vacuum-insulated piping is to be visually examined and records of maintenance and vacuum monitoring are to be reviewed.

- 23.9.2 The steam side of steam heaters is to be hydraulically tested to 1,5 times the design pressure.
- 23.9.3 Fuel pipe ducts or casings are to be generally examined and the exhaust or inerting arrangements are to be verified.
- 23.9.4 All alarms associated with the natural gas burning systems are to be verified; including, but not limited to, main and auxiliary engines, boilers, incinerators and gas combustion units.
- 23.9.5 The satisfactory condition of all pressure relief valves and/or safety discs throughout the installation is to be verified.

- 1 **Rule application**
- 2 **Direct calculations**
- 3 **Equivalents**
- 4 **National and International Regulations**
- 5 **Information required**
- 6 **Definitions**
- 7 **Equipment Number**
- 8 **Inspection and workmanship**
- 9 **Procedures for testing tanks and tight boundaries**

■ *Section 1* **Rule application**

1.1 General

1.1.1 The Rules apply in general to single hull ships of normal form, proportions and speed. Relevant parameters to define what is regarded as normal are given by limitations specified at the beginning of individual ship type Chapters. Although the Rules are, in general, for steel ships of all welded construction, other materials for use in hull construction will be considered.

1.2 Exceptions

1.2.1 Ships of unusual form, proportions or speed, intended for the carriage of special cargoes, or for special or restricted service, not covered by Pt 3 Ship Structures (General) and Pt 4 Ship Structures (Ship Types), will receive individual consideration based on the general standards of the Rules.

1.2.2 The requirements of Pt 3, Ch 1, 7.1 Calculation of Equipment Number are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation (see Pt 1, Ch 2, 2.3 Class notations (hull)).

1.3 Loading

1.3.1 The Rules are framed on the understanding that ships will be properly loaded and handled; they do not, unless it is stated or implied in the class notation, provide for special distributions or concentrations of loading other than those included in the approved Loading Manual. The Committee may require additional strengthening to be fitted in any ship which, in their opinion, would otherwise be subjected to severe stresses due to particular features of the design, or where it is desired to make provision for exceptional load or ballast conditions.

1.4 Advisory services

1.4.1 The Rules do not cover certain technical characteristics, such as stability, trim, vibration, docking arrangements, etc. The Committee cannot assume responsibility for these matters but is willing to advise upon them on request.

1.5 Intact stability

1.5.1 New ships to which the Load Lines Conventions are applicable will be assigned Class only after it has been demonstrated that the level of intact stability is adequate, see Pt 1, Ch 2, 1.1 General.

■ *Section 2* **Direct calculations**

2.1 General

2.1.1 Direct calculations may be specifically required by the Rules or may be required for ships having novel design features, as defined in Pt 3, Ch 1, 1.2 Exceptions or may be submitted in support of alternative arrangements and scantlings. Lloyd's Register (hereinafter referred to as 'LR') may, when requested, undertake calculations on behalf of designers and make recommendations in regard to suitability of any required model tests.

2.1.2 Where model testing is undertaken to complement direct calculations the following details would normally be required to be submitted:

- Schedule of tests;
- details of test equipment;
- input data;
- analysis; and
- calibration procedure together with tabulated and plotted output.

2.2 Submission of direct calculations

2.2.1 LR's direct calculation procedures and facilities are summarised in the document entitled *ShipRight Procedures Overview*.

2.2.2 In cases where direct calculations have been carried out using ShipRight procedures, the following supporting information should be submitted as applicable:

- (a) Reference to the ShipRight direct calculation procedure and technical program used.
- (b) A description of the structural modelling.
- (c) A summary of analysis parameters including properties and boundary conditions.
- (d) Details of the loading conditions and the means of applying loads.
- (e) A comprehensive summary of calculation results. Sample calculations should be submitted where appropriate.

2.2.3 In general, submission of large volumes of input and output data associated with such programs as finite element analysis will not be necessary.

2.2.4 The responsibility for error free specification and input of program data and the subsequent correct transposal of output rests with the Builder.

■ *Section 3* **Equivalents**

3.1 Alternative arrangements and scantlings

3.1.1 In addition to cases where direct calculations are specifically required by the Rules, LR will consider alternative arrangements and scantlings which have been derived by direct calculations in lieu of specific Rule requirements. All direct calculations are to be submitted for examination.

3.1.2 Where calculation procedures other than those available within ShipRight are employed, supporting documentation is to be submitted for appraisal and this is to include details of the following:

- calculation methods, assumptions and references;
- loading;
- structural modelling;
- direct criteria and their derivation, e.g. permissible stresses, factors of safety against plate panel instability, etc.

3.1.3 LR will be ready to consider use of Builders' programs for direct calculations in the following cases:

-
- (a) Where it can be established that the program has previously been satisfactorily used to perform a direct calculation similar to that now submitted.
- (b) Where sufficient information and evidence of satisfactory performance is submitted to substantiate the validity of the computation performed by the program.
-

■ *Section 4* **National and International Regulations**

4.1 International Conventions

4.1.1 The Committee, when authorised, will act on behalf of Governments and, if requested, LR will certify compliance in respect of National and International statutory safety and other requirements for passenger and cargo ships.

4.1.2 In satisfying the Load Line Conventions, the general structural strength of the ship is required to be sufficient for the draught corresponding to the freeboards to be assigned. Ships built and maintained in accordance with LR's Rules and Regulations possess adequate strength to satisfy the Load Line Conventions. However, some National Authorities may, in addition, require to be supplied with calculations of bending moments and shear forces for certain conditions of loading.

4.2 International Association of Classification Societies (IACS)

4.2.1 Where applicable, the Rules take into account unified requirements and interpretations established by IACS.

4.3 International Maritime Organization (IMO)

4.3.1 Attention is drawn to the fact that Codes of Practice issued by IMO contain requirements which are outside classification as defined in these Rules and Regulations.

■ *Section 5* **Information required**

5.1 General

5.1.1 The categories and lists of information required are given in Pt 3, Ch 1, 5.2 Plans and supporting calculations.

5.1.2 Plans are generally to be submitted in triplicate, but one copy only is necessary for supporting documents and calculations.

5.1.3 Plans are to contain all necessary information to fully define the structure, including construction details, equipment and systems as appropriate.

5.1.4 Additional requirements for individual ship types are given in subsequent Chapters.

5.2 Plans and supporting calculations

5.2.1 Plans covering the following items are to be submitted:

- Midship sections showing longitudinal and transverse material.
 - Profile and decks.
 - Shell expansion.
 - Oiltight and watertight bulkheads.
 - Propeller brackets.
 - Double bottom construction.
 - Pillars and girders.
 - Aft end construction.
 - Engine room construction.
-

-
- Engine and thrust seatings.
 - Fore end construction.
 - Hatch coamings.
 - Hatch cover construction.
 - Deckhouses and superstructures.
 - Sternframe.
 - Rudder, stock and tiller.
 - Equipment.
 - Loading Manuals, preliminary and final.
 - Ice strengthening.
 - Welding.
 - Hull penetration plans.
 - Support structure for masts, derrick posts or cranes.
 - Bilge keels showing material grades, welded connections and detail design.
 - Supporting structure of deck fittings used for towing and mooring.

5.2.2 The following supporting documents are to be submitted:

- General arrangement.
- Capacity plan.
- Lines plan or equivalent.
- Dry-docking plan.
- Freeboard plan or equivalent showing freeboards and items relative to the conditions of assignment.
- Towing and mooring arrangements plan as defined in Pt 3, Ch 1, 5.3 Plans to be supplied to the ship.
- When the ship is required to comply with statutory damage stability criteria: Watertight Integrity plan or equivalent showing watertight boundaries and associated design head necessary to satisfy damage stability criteria.

5.2.3 The following supporting calculations are to be submitted:

- Calculation of Equipment Number.
- Calculation of hull girder still water bending moment and shear force as applicable.
- Calculation of midship section modulus.
- Calculations for structural items in the aft end, midship and fore end regions of the ship.
- Preliminary freeboard calculation.

5.2.4 Where an ***IWS** (In-water Survey) notation is to be assigned (see Pt 1, Ch 2, 2.3 Class notations (hull)), plans and information covering the following items are to be submitted:

- Details showing how rudder pintle and bush clearances are to be measured and how the security of the pintles in their sockets is to be verified with the vessel afloat.
- Details showing how stern bush clearances are to be measured with the vessel afloat.
- Details of high resistance paint, for information only.

5.2.5 Where it is intended to exchange ballast water at sea resulting in the partial filling of the ballast spaces, the scantlings and structural arrangements of the tank boundaries are to be capable of withstanding the loads imposed by the movement of the ballast water in those spaces. The magnitude of the predicated loadings, together with the scantling calculations, may require to be submitted.

5.2.6 Ships that are required to comply with SOLAS Regulation 3-6 in chapter II-1 for 'Access to and within spaces in the cargo area of oil tankers and bulk carriers' are to supply information showing attachment of the access arrangements to the ship structure. This is to include necessary strength calculations, local detail and any reinforcements.

5.2.7 Ships that are required to comply with the *Performance Standards for Protective Coatings* of SOLAS Regulation II-1/3-2 are to submit information on the coating specification agreed by the shipyard, the ship owner and the manufacturer, including the coating system selection, surface preparation and coating application and inspection procedure. Corrosion prevention arrangements and coating system specifications are to comply with Ch 15 Corrosion Prevention of the Rules for Materials.

5.3 Plans to be supplied to the ship

5.3.1 To facilitate the ordering of materials for repairs, plans are to be carried in the ship indicating the disposition and grades (other than Grade A) of hull structural steel, the extent and location of higher tensile steel together with details of specification and mechanical properties, and any recommendations for welding, working and treatment of these steels.

5.3.2 Similar information is to be provided when aluminium alloy or other materials are used in the hull construction.

5.3.3 A copy of the final Loading Manual, when approved, and details of the loadings applicable to approved decks, hatch covers and inner bottom are to be placed on board the ship.

5.3.4 Details of any corrosion prevention systems applied or fitted, are to be placed onboard the ship.

5.3.5 For ships that are required to comply with IMO *Performance Standard for Protective Coatings*, a copy of the Coating Technical File (CTF) is to be kept on board the vessel, see Ch 15 Corrosion Prevention of the Rules for Materials.

5.3.6 Details of any corrosion control system fitted are to be placed on board the ship.

5.3.7 Copies of main scantling plans are to be placed on board.

5.3.8 Where an ***IWS** (In-water Survey) notation is to be assigned, approved plans and information covering the items detailed in Pt 3, Ch 1, 5.2 Plans and supporting calculations are to be placed on board.

5.3.9 Where a ShipRight **CM** (Construction Monitoring) notation or descriptive note is to be assigned, the approved Construction Monitoring Plan (CMP), as detailed in the *ShipRight Construction Monitoring Procedures*, is to be maintained on board the ship.

5.3.10 The towing and mooring arrangements plan is to be provided on board for the guidance of the Master. The information provided on the plan is to include the following in respect of each shipboard fitting:

- Location on the ship.
- Fitting type.
- Safe working load (SWL).
- Purpose of fitting (mooring/harbour towing/escort towing).
- Manner of applying towing or mooring line load, including limiting fleet angles.
- Strength of each mooring line.
- The number of mooring lines supplied on board the ship.

This information is to be incorporated into the pilot card in order to provide the pilot with the necessary information on harbour/escorting operations.

5.4 Fire protection, detection and extinction

5.4.1 For information and plans required, see Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements.

■ Section 6

Definitions

6.1 Principal particulars

6.1.1 Rule length, L , is the distance, in metres, on the waterline at draught T , from the forward side of the stem to the after side of the rudder post or to the centre of the rudder stock if there is no rudder post. L is to be not less than 96 per cent, and need not be greater than 97 per cent, of the extreme length on the waterline. For ships without rudders, the Rule length is to be taken as 97 per cent of the extreme length on the waterline. In ships with unusual stem or stern arrangements the Rule length, L , will be specially considered.

6.1.2 Amidships is to be taken as the middle of the Rule length, L , measuring from the forward side of the stem.

6.1.3 Breadth, B , is the greatest moulded breadth, in metres.

6.1.4 Depth, D , is measured, in metres, at the middle of the length, L , from top of keel to top of the deck beam at side on the uppermost continuous deck, or as defined in appropriate Chapters. When a rounded gunwale is arranged, the depth D is to be measured to the continuation of the moulded deck line.

6.1.5 Draught, T , is the summer draught, in metres, measured from top of keel, or a greater value if such a value has been specified as 'scantling draught'. Both of the draughts are to be indicated on the midship plan, irrespective of whether or not they are of the same value.

6.1.6 The block coefficient, C_b , is the moulded block coefficient at draught, T , based on Rule length, L , and moulded breadth, B , as follows:

$$C_b = \frac{\text{moulded displacement (m}^3\text{) at draught } T}{LBT}$$

6.1.7 Length between perpendiculars, L_{pp} , is the distance, in metres, on the waterline at draught T , from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post. In ships with unusual stern arrangements the length, L_{pp} , will be specially considered. The forward perpendicular, F.P., is the perpendicular at the intersection of the waterline with the fore side of the stem. The after perpendicular, A.P., is the perpendicular at the intersection of the waterline with the after side of the rudder post. For ships without a rudder post, the A.P. is the perpendicular at the intersection of the waterline with the centreline of the rudder stock.

6.1.8 Load line length, L_L , is to be taken as 96 per cent of the total length on a waterline at 85 per cent of the least moulded depth measured from the top of the keel, or as the length from the fore side of the stem to the axis of the rudder stock on that waterline, if that is greater. In ships designed with a rake of keel, the waterline on which this length is measured is to be parallel to the designed waterline. The length L_L is to be measured in metres.

6.1.9 Load line block coefficient, C_{bL} , is defined as:

$$C_{bL} = \frac{\nabla}{L_L B T_L}$$

where

∇ = volume of the moulded displacement, in m^3 , excluding appendages, taken at draught T_L

T_L = moulded draught, in metres, measured to the waterline at 85 per cent of the least moulded depth.

6.1.10 Maximum service speed, V , means the maximum ahead service speed, in knots, which the ship is designed to maintain, at the summer load waterline at maximum propeller RPM and corresponding MCR.

6.1.11 Bow reference height, H_b , is defined as:

For ships less than 250 m in length:

$$H_b = 0,056L_L \left(1 - \frac{L_L}{500}\right) \left(\frac{1,36}{C_{bL} + 0,68}\right) \text{m}$$

For ships 250 m or greater in length:

$$H_b = 7 \left(\frac{1,36}{C_{bL} + 0,68}\right) \text{m}$$

where

L_L = is defined in Pt 3, Ch 1, 6.1 Principal particulars

C_{bL} = is defined in Pt 3, Ch 1, 6.1 Principal particulars.

6.2 Freeboard deck

6.2.1 The freeboard deck is normally the uppermost complete deck exposed to weather and sea, which has permanent means of closing all openings in the weather part, and below which all openings in the sides of the ship are fitted with permanent means of watertight closing.

6.2.2 For the purposes of the Load Lines Conventions, as applicable, where the assigned summer freeboard is increased such that the resulting draught is not more than that corresponding to a minimum summer freeboard for the same ship, but with

an assumed freeboard deck located a distance below the actual freeboard deck at least equal to the standard superstructure height, the related items for the conditions of assignment to the actual freeboard deck may be as required for a superstructure deck.

6.3 Weathertight

6.3.1 A closing appliance is considered weathertight if it is designed to prevent the passage of water into the ship in any sea conditions.

6.3.2 Generally, all openings in the freeboard deck and in enclosed superstructures are to be provided with weathertight closing appliances.

6.4 Watertight

6.4.1 A closing appliance is considered watertight if it is designed to prevent the passage of water in either direction under a head of water for which the surrounding structure is designed.

6.4.2 Generally, all openings below the freeboard deck in the outer shell/envelope (and in main bulkheads) are to be fitted with permanent means of watertight closing.

6.5 Position 1 and Position 2

6.5.1 For the purpose of Load Line conditions of assignment, there are two basic positions of hatchways, doorways and ventilators defined as follows:

- | | | |
|------------|---|--|
| Position 1 | - | Upon exposed freeboard and raised quarterdecks, and exposed superstructure decks within the forward 0,25 of the load line length. |
| Position 2 | - | Upon exposed superstructure decks abaft the forward 0,25 of the load line length and located at least one standard height of superstructure above the freeboard deck. Upon exposed superstructure decks situated within the forward 0,25 of the Load Line length and located at least two standard heights of superstructure above the freeboard deck. |

6.6 Passenger ship

6.6.1 A passenger ship is a ship which carries more than 12 passengers.

6.7 Reference system

6.7.1 For hull reference purposes, the ship is divided into 21 equally spaced stations where Station 0 is the after perpendicular, Station 20 is the forward perpendicular, and Station 10 is mid- L_{pp} .

6.8 Co-ordinate system

6.8.1 Unless otherwise stated, the co-ordinate system is as shown in Figure 1.6.1 Co-ordinate system, that is, a right-hand co-ordinate system with the X axis positive forward, the Y axis positive to port and the Z axis positive upwards. Angular motions are considered positive in a clockwise direction about the X, Y or Z axes.

Figure 1.6.1: Co-ordinate system

■ Section 7 **Equipment Number**

7.1 Calculation of Equipment Number

7.1.1 The equipment of anchors and chain cables specified in Pt 3, Ch 13, 7 Equipment is based on an 'Equipment Number' which is to be calculated as follows:

$$\text{Equipment Number} = \Delta^{\frac{2}{3}} + 2BH + \frac{A}{10}$$

where

A = area, in m², in profile view of the hull, within the Rule length of the vessel, and of superstructures and houses above the summer load waterline, which are within the Rule length of the vessel, and also having a breadth greater than $\frac{B}{4}$

= See also Pt 3, Ch 1, 7.1 Calculation of Equipment Number and Pt 3, Ch 1, 7.1 Calculation of Equipment Number

B = greatest moulded breadth, in metres

H = freeboard amidships, in metres, from the summer load waterline to the upper deck, plus the sum of the heights at the centreline, in metres, of each tier of houses having a breadth greater than $\frac{B}{4}$

= See also Pt 3, Ch 1, 7.1 Calculation of Equipment Number, Pt 3, Ch 1, 7.1 Calculation of Equipment Number and Pt 3, Ch 1, 7.1 Calculation of Equipment Number

Δ = moulded displacement, in tonnes, to the summer load waterline.

7.1.2 In the calculation of *H* and *A*, sheer and trim are to be ignored. Where there is a local discontinuity in the upper deck, *H* is to be measured from a notional deckline.

7.1.3 If a house having a breadth greater than $\frac{B}{4}$ is above a house with a breadth of $\frac{B}{4}$ or less, then the wide house is to be included, but the narrow house ignored.

7.1.4 Screens and bulwarks more than 1,5 m in height are to be regarded as parts of houses when determining *H* and *A*. Where a screen or bulwark is of varying height, the portion to be included is to be that length the height of which exceeds 1,5 m.

7.1.5 The Equipment Number for tugs is to be calculated as follows:

$$EquipmentNumber = \Delta^{\frac{2}{3}} + 2(Bf + \Sigma bh) + \frac{A}{10}$$

where

Δ, B and A = are defined in Pt 3, Ch 1, 7.1 Calculation of Equipment Number

b = breadth, in metres, of the widest superstructure or deckhouse on each tier.

f = freeboard amidships, in metres, from the summer load waterline

h = the height, in metres, of each tier of superstructure or deckhouse at side having a breadth of $\frac{B}{4}$ or greater. In the calculation of h , sheer and trim are to be ignored.

■ Section 8 Inspection and workmanship

8.1 Inspection

8.1.1 Adequate facilities are to be provided to enable the Surveyor to carry out a satisfactory inspection of all components during each stage of prefabrication and construction.

8.2 Workmanship

8.2.1 All workmanship is to be of good quality and in accordance with good shipbuilding practice. Any defect is to be rectified to the satisfaction of the Surveyor before the material is covered with paint, cement or other composition. The materials and welding are to be in accordance with the requirements of the Rules for Materials. The assembly sequence and welding sequence are to be agreed prior to construction and are to be to the satisfaction of the Surveyor. Plates which have been subjected to excessive heating while being worked are to be satisfactorily heat treated before being erected in the hull.

8.2.2 **Wood sheathing on decks.** Where plated decks are sheathed with wood, the sheathing is to be efficiently attached to the deck, caulked and sealed, to the satisfaction of the Surveyor.

8.2.3 **Rudder and sternframe.** The final boring out of the propeller boss and sternframe skeg or solepiece, and the fit-up and alignment of the rudder, pintles and axles, are to be carried out after completing the major part of the welding of the after part of the ship. The contacts between the conical surfaces of pintles, rudder stocks and rudder axles are to be checked before the final mounting.

8.3 Trial trip and operational tests

8.3.1 The items listed in Table 1.8.1 Trial trip and operational tests are to be tested on completion of the installation or at sea trials.

Table 1.8.1: Trial trip and operational tests

Item	Requirement
Sliding watertight doors	To be operated under working conditions
Windlass	An anchoring test is to be carried out in the presence of the Surveyor The test should demonstrate that the windlass with brakes, etc. functions satisfactorily, and that the power to raise anchor can be developed and satisfies the Rule requirements For Rule requirements, see Pt 3, Ch 13, 7 Equipment.

Steering gear, main and auxiliary	To be tested under working conditions, to the satisfaction of the Surveyors, to demonstrate that the Rule requirements are met For Rule requirements, see Pt 5, Ch 19 Steering Arrangements.
Bilge suctions in holds, and hand pumps in peak spaces	To be tested under working conditions to the satisfaction of the Surveyors.

■ Section 9

Procedures for testing tanks and tight boundaries

9.1 General

9.1.1 The test procedures detailed in this Section are to be used to confirm the watertightness of tanks and watertight boundaries, the structural adequacy of tanks and weathertightness of structures.

9.2 Application

9.2.1 The testing requirements for gravity tanks, defined as tanks subject to a vapour pressure not greater than 70 kN/m², and other boundaries required to be watertight or weathertight, are to be tested in accordance with this Section. Tests are to be carried out in the presence of a Surveyor at a stage sufficiently close to completion such that the strength and tightness are not subsequently impaired and prior to any sealing and cement work being applied over joints.

9.2.2 The testing of cargo containment systems of liquefied gas carriers are to be in accordance with the requirements of Ch 4, 10 Construction and testing of the *Rules and Regulations for the Classification of Ships for the Carriage of Liquefied Gases in Bulk*.

9.2.3 The testing of structures not listed in this Section are to be specially considered.

Table 1.9.1: Testing requirements

Item to be tested	Testing procedure	Testing requirement
Double bottom tanks, see Note 1	Leak and structural	The greater of: <ul style="list-style-type: none"> head of water up to the top of the overflow head of water 2,4 m above top of tank, see Note 2 head of water up to bulkhead deck
Combined double bottom and hopper side tanks	Leak and structural	The greater of: <ul style="list-style-type: none"> head of water up to the top of the overflow head of water representing the maximum pressure experienced in service
Double bottom voids, see Note 3	Leak	
Double side tanks	Leak and structural	The greater of: <ul style="list-style-type: none"> head of water up to the top of the overflow head of water 2,4 m above top of tank, see Note 2 head of water up to bulkhead deck
Combined double bottom, lower hopper and topside tanks	Leak and structural	
Topside tanks	Leak and structural	
Double side voids	Leak	

Deep tanks (other than those listed elsewhere)	Leak and structural	The greater of: <ul style="list-style-type: none"> head of water up to the top of the overflow head of water 2,4 m above top of tank, see Note 2
Cargo oil tanks, and fuel oil bunkers	Leak and structural	The greater of: <ul style="list-style-type: none"> head of water up to the top of the overflow head of water 2,4 m above top of tank, see Note 2 head of water up to top of tank, see Note 2, plus setting of fitted pressure-relief valve
Scupper and discharge pipes in way of tanks	Leak and structural	
Ballast hold of bulk carriers	Leak and structural	The greater of: <ul style="list-style-type: none"> head of water up to the top of the overflow head of water up to the top of cargo hatch coaming
Peak tanks, see Note 4	Leak and structural	The greater of: <ul style="list-style-type: none"> head of water up to the top of the overflow head of water 2,4 m above top of tank, see Note 2
Fore peak voids	Leak	
Aft peak voids, see Note 4	Leak	
Cofferdams	Leak	
Watertight bulkheads	Leak	See Note 5
Superstructure end bulkhead	Leak	
Watertight doors below freeboard or bulkhead deck	Leak	See Notes 5 and 6
Double plate rudder blade	Leak	
Shaft tunnel clear of deep tanks	Leak	See Note 5
Shell doors when fitted in place	Leak	See Notes 5 and 7
Weathertight hatch covers and closing appliances	Leak	See Note 5
Steel hatch covers fitted to the cargo oil tanks and cargo holds of ships used for the alternate carriage of oil cargo and dry bulk cargo	Leak	See Note 5
Chain locker	Leak and structural	Head of water up to top of chain pipe
Independent tanks, and edible liquid tanks	Leak and structural	The greater of: <ul style="list-style-type: none"> head of water up to the top of the overflow head of water 0,9 m above top of tank, see Note 2
Ballast ducts	Leak and structural	The greater of: <ul style="list-style-type: none"> ballast pump maximum pressure setting of pressure-relief valve

Chemical tanker cargo tanks	Leak and structural	<p>The greater of:</p> <ul style="list-style-type: none"> • head of water 2,4 m above top of tank, see Note 2 • head of water up to top of tank, see Note 2, plus setting of fitted pressure-relief valve
<p>Note 1. Including tanks arranged in accordance with the provisions of SOLAS Reg. II-1/9.4.</p> <p>Note 2. Top of tank is the deck forming the top of the tank, excluding any hatchways. In holds for liquid cargo or ballast with large hatch openings, the top of tank is to be taken to the top of the hatch.</p> <p>Note 3. Including duct keels and dry compartments arranged in accordance with the provisions of SOLAS Reg. II-1/9.4.</p> <p>Note 4. Testing of the aft peak is to be carried out after the sterntube has been fitted.</p> <p>Note 5. A hose test will be considered, see Pt 3, Ch 1, 9.5 Leak test procedures and Pt 3, Ch 1, 9.6 Definitions and details of tests.</p> <p>Note 6. Watertight doors not confirmed watertight by a prototype test are to be subject to a hydrostatic test, see SOLAS Reg. II-1/16.2.</p> <p>Note 7. For shell doors providing watertight closure, watertightness is to be demonstrated through prototype testing before installation. The testing procedure is to be agreed with LR prior to testing.</p> <p>Note 8. Other testing methods listed in Pt 3, Ch 1, 9.6 Definitions and details of tests and Pt 3, Ch 1, 9.6 Definitions and details of tests may be considered, subject to adequacy of such testing methods being verified, see SOLAS Reg. II-1/11.1.</p>		

9.3 Test types

9.3.1 The types of test specified in this Section are:

- Structural test:** which is to be conducted to verify the tightness and structural adequacy of the construction of tanks. This may be a hydrostatic test or, where the situation warrants, a hydropneumatic test.
- Leak test:** which is to be used to verify the tightness of a boundary. Unless a specific test is indicated, this may be a hydrostatic, hydropneumatic test, air or other medium test.

9.4 Structural test procedures

9.4.1 Where a structural test is specified in Table 1.9.1 Testing requirements, unless specified otherwise, a hydrostatic test is to be carried out in accordance with Pt 3, Ch 1, 9.6 Definitions and details of tests. Where practical limitations prevent a hydrostatic test being carried out, a hydropneumatic test in accordance with Pt 3, Ch 1, 9.6 Definitions and details of tests is to be conducted.

9.4.2 A hydrostatic test may be carried out afloat to confirm the structural adequacy of tanks, provided a leak test is carried out beforehand and the results are confirmed as satisfactory.

9.4.3 For tanks of the same structural design, configuration and the same general workmanship, as determined by the attending Surveyor, a structural test may be carried out on only one tank, provided all subsequent tanks are tested for leaks by an air test. The relaxation to accept leak testing using an air test instead of a structural test does not apply to cargo space boundaries in tankers and combination carriers and tanks for segregated cargoes or pollutants.

9.4.4 Where the structural adequacy of a tank has been verified by structural testing on a previous vessel in a series, tanks of structural similarity on subsequent vessels within that series may be exempt from such testing, provided that the watertightness of all exempt tanks is verified by leak tests and thorough inspection. For sister ships built several years after the last ship in a series, such exemptions may be reconsidered. However, structural testing is to be carried out for at least one tank on each vessel in the series in order to verify structural fabrication adequacy. The relaxation to accept leak testing and thorough inspections instead of a structural test on subsequent vessels in a series does not apply to cargo space boundaries in tankers and combination carriers and tanks for segregated cargoes or pollutants.

9.4.5 Tanks exempted from structural testing in Pt 3, Ch 1, 9.4 Structural test procedures and Pt 3, Ch 1, 9.4 Structural test procedures may require structural testing if found necessary after the structural testing of the first tank.

9.4.6 For watertight boundaries of spaces other than tanks, excluding chain lockers, structural testing may be exempted, provided that the watertightness in all boundaries of exempted spaces are verified by leak tests and thorough inspection.

9.4.7 Consideration is to be given to the selection of tanks to be structurally tested. Selected tanks should be chosen so that all representative structural members are tested for the expected tension and compression.

9.5 Leak test procedures

9.5.1 Where a leak test is specified in Table 1.9.1 Testing requirements, unless specified otherwise, a tank air test, compressed air fillet weld test, or vacuum box test is to be carried out in accordance with the applicable requirements of Pt 3, Ch 1, 9.6 Definitions and details of tests to Pt 3, Ch 1, 9.6 Definitions and details of tests. A hydrostatic or hydropneumatic test conducted in accordance with the applicable requirements of Pt 3, Ch 1, 9.6 Definitions and details of tests and Pt 3, Ch 1, 9.6 Definitions and details of tests will be accepted as a leak test.

9.5.2 A hose test will be accepted as means of verifying the tightness of joints only in specific locations, identified in Table 1.9.1 Testing requirements.

9.5.3 Air tests of joints may be conducted at any stage during construction provided that all work that might affect the tightness of the joint is completed before the test is carried out.

9.6 Definitions and details of tests

9.6.1 **Hydrostatic test** is a test conducted by filling a space with a liquid to a specified head. Unless another liquid is approved, the hydrostatic test is to consist of filling a space with either fresh or sea-water, whichever is appropriate for the space being tested, to the level specified in Table 1.9.1 Testing requirements. For tanks intended to carry cargoes of a higher density than the test liquid, the head of the liquid is to be specially considered.

9.6.2 **Hydropneumatic test** is a combination of a hydrostatic test and a tank air test, consisting of partially filling a tank with water and conducting a tank air test on the unfilled portion of the tank. A hydropneumatic test, where approved, is to be such that the test condition in conjunction with the approved liquid level and air pressure will simulate the actual loading as far as practicable. The requirements for tank air testing shown in Pt 3, Ch 1, 9.6 Definitions and details of tests are to be adhered to.

9.6.3 **Hose test** is a test used to verify the tightness of joints with a jet of water. It is to be carried out with the pressure in the hose nozzle maintained at not less than 2,0 bar during the test. The hose nozzle is to have a minimum inside diameter of 12 mm and is to be situated no further than 1,5 m from the joint. Where a hose test is not practical because of possible damage to machinery, electrical equipment insulation or outfitting items, it may be replaced by a careful visual examination of welded connections, supported by an ultrasonic or penetration leak test, or an equivalent, see SOLAS Reg. II-1/11.1.

9.6.4 **Tank air test** is to be used to verify the tightness of a compartment by means of an air pressure differential and leak detection solution. An efficient indicating solution (e.g. soapy water) is to be applied to the weld or penetration being tested and is to be examined whilst an air pressure differential of not less than 0,15 bar is applied by pumping air into the compartment. It is recommended that the air pressure in the tank be raised to and maintained at 0,20 bar above atmospheric pressure for one hour, with a minimum number of personnel in the vicinity of the tank, before being lowered to 0,15 bar above atmospheric pressure. Arrangements are to be made to ensure that any increase in air pressure does not exceed 0,30 bar. A U-tube with a height sufficient to hold a head of water corresponding to the required test pressure is to be used for verification and to avoid overpressure. The cross-sectional area of the U-tube is not to be less than that of the pipe supplying air to the tank. In addition, the test pressure is to be verified by means of a pressure gauge, or alternative equivalent system. All boundary welds, erection joints and penetrations including pipe connections in the compartment are to be examined.

9.6.5 **Compressed air fillet weld test.** This test consists of compressed air being injected into one end of a fillet welded joint and the pressure verified at the other end of the joint by a pressure gauge on the opposite side. Pressure gauges are to be arranged so that an air pressure of at least 0,15 bar above atmospheric pressure can be verified at each end of all passages within the portion being tested. A leak indicator solution is to be applied and the weld line examined for leaks. A compressed air test may be carried out for partial penetration welds where the root face is greater than 6 mm.

9.6.6 **Vacuum box test** is a test used to verify the tightness of joints by means of a localised air pressure differential and indicator solution. The test is to be conducted with the use of a box with air connections, gauges and an inspection window that is to be placed over the joint being tested with a leak indicator solution applied. The air within the box is to be removed by an ejector to create a vacuum i.e. a pressure differential of 0,20 to 0,26 bar inside the box.

9.6.7 **Ultrasonic test** may be used where a hose test is not practical to verify the tightness of a boundary, see 9.6.3. An arrangement of ultrasonic echo transmitters is to be placed inside a compartment and a receiver outside. The receiver is to be used to detect any leaks in the compartment.

9.6.8 **Penetration test** may be used where a hose test is not practical to assess butt welds, see 9.6.3, by applying a low surface tension liquid to one side of a compartment boundary. When no liquid is detected on the opposite side of the boundary after expiration of a definite time, the verification of tightness of the compartment's boundary may be assumed.

9.6.9 Other methods of testing may be considered and are to be agreed by LR prior to commencement of testing.

9.7 Application of coating

9.7.1 A final coating may be applied over automatic butt welds before the completion of a leak test, provided that careful visual inspections show continuous uniform weld profile shape, free from repairs, and the results of selected NDE testing show no significant defects. For all other joints, the final coating is to be applied after the completion of a leak test. The Surveyor reserves the right to require a leak test prior to the application of the final coating over automatic erection butt welds.

9.7.2 Any temporary coating which may conceal defects or leaks is to be applied at a time as specified for the final coating, see Pt 3, Ch 1, 9.7 Application of coating. This requirement does not apply to shop primer.

9.8 Safe access to joints

9.8.1 For leak tests, safe access to all joints under examination is to be provided.

*Section***1 Materials of construction****2 Fracture control****3 Corrosion protection****4 Deck covering**

■ **Section 1**
Materials of construction

1.1 General

1.1.1 The Rules relate in general to the construction of steel ships, although consideration will be given to the use of other materials.

1.1.2 The materials used in the construction of the ship are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as Rules for Materials). Materials for which provision is not made therein may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

1.1.3 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation (see Pt 1, Ch 2, 2.3 Class notations (hull)) with the exception of Pt 3, Ch 2, 1.2 Steel and Pt 3, Ch 2, 3.2 Prefabrication primers which are to be complied with.

1.2 Steel

1.2.1 Steel having a specified minimum yield stress of 235 N/mm² (24 kgf/mm²) is regarded as mild steel. Steel having a higher specified minimum yield stress is regarded as higher tensile steel.

1.2.2 For the determination of the hull girder section modulus, where higher tensile steel is used, a higher tensile steel factor, k_L , is given in Table 2.1.1 Values of k_L .

Table 2.1.1: Values of k_L

Specified minimum yield stress in N/mm ² (kgf/mm ²)	k_L
235 (24)	1,0
265 (27)	0,92
315 (32)	0,78
355 (36)	0,72
390 (40)	0,68 (0,66 see Note 3)
460 (47) see Note 3	0,62 see Note 3
<p>Note 1. Intermediate values by linear interpolation.</p> <p>Note 2. For the purpose of calculating hull moment of inertia as specified in Pt 3, Ch 4, 5.8 Hull moment of inertia, $k_L = 1,0$.</p> <p>Note 3. Grade only applies to thickness above 50 mm for upper deck, hatch coamings, shear strake, uppermost strake of longitudinal bulkhead and other longitudinal strength members in way of the above structures of container ships. The requirements specified in Ch 3, 3 Higher strength steels for ship and other structural applications of the Rules for Materials apply, see Pt 3, Ch 2, 1.2 Steel and Pt 3, Ch 2, 1.2 Steel.</p>	

1.2.3 The local scantling requirements of higher tensile steel plating, longitudinals, stiffeners and girders may be based on a k factor determined as follows:

$$k = \frac{235}{\sigma_0} \left(k = \frac{24}{\sigma_0} \right)$$

or 0,66, whichever is the greater,

where

σ_0 = specific minimum yield stress in N/mm² (kgf/mm²)

1.2.4 For the application of the requirements of Pt 3, Ch 2, 1.2 Steel and Pt 3, Ch 2, 1.2 Steel, special consideration will be given to steel where $\sigma_0 > 355$ N/mm² (36 kgf/mm²). Where such steel grades are used in areas which are subject to fatigue loading, the structural details are to be verified using fatigue design assessment methods.

1.2.5 For container ships only, a k_L factor of 0,66 may be applied to steel with a specified minimum yield stress of 390 N/mm² (40 kgf/mm²), or a k_L factor of 0,62 may be applied to steel with a specified minimum yield stress of 460 N/mm² (47 kgf/mm²) for structural members that contribute to the ship's longitudinal strength, provided that:

- (a) the member's plate or web thickness is greater than 50 mm;
- (b) the requirements of Pt 3, Ch 2, 1.2 Steel are satisfied; and
- (c) a spectral fatigue assessment is carried out in accordance with *ShipRight Fatigue Design Assessment* (FDA level 3) procedure, to demonstrate that key structural details sensitive to the hull girder loads have satisfactory fatigue performance. The assessment should normally include the following:
 - Hatch corners in way of cross-deck strips;
 - Hatch corners at the forward region;
 - Hatch corners forward and aft of the engine room and the accommodation blocks;
 - Connection of hatch coaming to supporting structure; and
 - Other critical locations subject to dynamic hull girder bending and torsional effects.

In addition, the ShipRight Construction Monitoring (CM) procedure is to be applied to the fatigue critical locations described above.

1.2.6 Where steel castings or forgings are used for sternframes, rudder frames, rudder stocks, propeller shaft brackets and other major structural items, they are to comply with Ch 4 Steel Castings or Ch 5 Steel Forgings of the Rules for Materials, as appropriate.

1.3 Aluminium

1.3.1 The use of aluminium alloy is permitted for superstructures, deckhouses, hatch covers, helicopter platforms, or other local components on board ships.

1.3.2 Aluminium is not to be used for the crowns or casings of Category A machinery spaces, see Pt 5, Ch 1, 4.8 Category A machinery spaces.

1.3.3 Except where otherwise stated, equivalent scantlings are to be derived as follows:

- (a) Plating thickness;

$$t_a = t_s \sqrt{k_a c}$$

- (b) Section modulus of stiffeners;

$$Z_a = Z_s k_a c$$

where

c = 0,95 for high corrosion resistant alloy

= 1,00 for other alloys

$$k_a = \frac{245}{\sigma_a}$$

t_a = thickness of aluminium plating

t_s = thickness of mild steel plating

Z_a = section modulus of aluminium stiffener

where

Z_s = section modulus of mild steel stiffener

σ_a = 0,2 per cent proof stress or 70 per cent of the ultimate strength of the material, whichever is the lesser.

1.3.4 In general, for welded structure, the maximum value of σ_a to be used in the scantlings derivation is that of the aluminium in the welded condition. However, consideration will be given to using unwelded values depending upon the weld line location, other heat affected zones, in relation to the maximum applied stress on the member (e.g. extruded sections).

1.3.5 A comparison of the mechanical properties for selected welded and unwelded alloys is given in Ch 13, 8.3 Fabrication and welding of the Rules for Materials.

1.3.6 Where strain hardened grades (designated Hxxx) are used, adequate protection by coating is to be provided to avoid the risk of stress corrosion cracking.

■ Section 2 Fracture control

2.1 Grades of steel

2.1.1 The resistance to fracture is controlled, in part, by the notch toughness of the steel used in the structure. Steels with different levels of notch toughness are specified in the Rules for Materials. The grade of steel to be used is, in general, related to the thickness of the material and the stress pattern associated with its location.

2.1.2 In order to distinguish between the material grade requirements for different hull members at varying locations along the ship, material classes are assigned as shown in Table 2.2.1 Material classes and grades. For each class, depending on thickness, the material grade requirements are not to be lower than those given in Table 2.2.2 Steel grades.

2.1.3 Where tee or cruciform connections employ full penetration welds, and the plate material is subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties, as detailed in Ch 3, 8 Plates with specified through thickness properties of the Rules for Materials.

2.1.4 Design for normal worldwide service assumes the navigation to areas of minus 10°C, where the design air temperature is to be taken as the lowest mean daily average air temperature in the area of operation:

where

Mean = statistical mean over a minimum of 20 years

Average = average during one day and one night

Lowest = lowest during the year

MDHT = Mean Daily High Temperature

MDAT = Mean Daily Average Temperature

MDLT = Mean Daily Low Temperature

Figure 2.2.1 Design air temperature shows the definition graphically.

The material grade of exposed structure of ships intended to operate in external air temperatures below minus 10°C will be specially considered, see also *The Provisional Rules for the Winterisation of Ships*.

**Figure 2.2.1: Design air temperature****2.2 Refrigerated spaces**

2.2.1 Where the minimum design temperature of the steel falls below 0°C in refrigerated spaces, in addition to the requirements of Pt 3, Ch 2, 2.1 Grades of steel, the grade of steel for the following items is to comply, in general, with the requirements of Table 2.2.3 Grades of steel for refrigerated spaces with a minimum design temperatures below 0°C:

- Deck plating.
- Webs of deck girders.
- Longitudinal bulkhead strakes attached to deck.
- Shelf plates and their face bars supporting hatch covers.

2.2.2 Unless a temperature gradient calculation is carried out to assess the design temperature in the items defined in Pt 3, Ch 2, 2.2 Refrigerated spaces, the temperature to which the steel deck may be subjected is to be assessed as shown in Table 2.2.4 Assessment of deck temperature.

Table 2.2.1: Material classes and grades

Structural member category		Material class/Minimum grade
SECONDARY		
A1.	Longitudinal bulkhead strakes, other than belonging to the Primary category	Class I within 0,4L amidships Grade A/AH outside 0,4L amidships
A2.	Deck plating exposed to weather, other than that belonging to the Primary or Special category	
A3.	Side plating	
PRIMARY		
B1.	Bottom plating, including keel plate	
B2.	Strength deck plating, excluding that belonging to the Special category	

Materials**Part 3, Chapter 2***Section 2*

B3.	Continuous longitudinal plating of strength members above strength deck, excluding hatch coamings	Class II within 0,4L amidships
B4.	Uppermost strake in longitudinal bulkhead	Grade A/AH outside 0,4L amidships
B5.	Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank	
SPECIAL		
C1.	Sheerstrake (or rounded gunwale) and stringer plate at strength deck, see Note 1	Class III within 0,4L amidships
C2.	Deck strake at longitudinal bulkhead excluding deck plating in way of inner skin bulkhead of double hull ships, see Note 1	Class II outside 0,4L amidships Class I outside 0,6L amidships
C3.	Strength deck plating at outboard corners of cargo hatch openings (and plating intersections of the longitudinal underdeck girders and the cross-deck strips) in container carriers and other ships with similar hatch opening configurations	Class III within 0,4L amidships Class II outside 0,4L amidships Class I outside 0,6L amidships Minimum Class III within cargo region
C4.	Strength deck plating at corners of cargo hatch openings in bulk carriers (see Pt 3, Ch 2, 1.1 General), ore carriers, combination carriers and other ships with similar hatch opening configurations	Class III within 0,6L amidships
C5.	Trunk deck and inner deck plating at corners of openings for liquid and gas domes in membrane type liquefied gas carriers	Class II within rest of cargo region
C6.	Bilge strake in ships with double bottom over the full breadth and length less than 150 m	Class II within 0,6L amidships Class I outside 0,6L amidships
C7.	Bilge strake in other ships, see Note 1	Class III within 0,4L amidships Class II outside 0,4L amidships Class I outside 0,6L amidships
C8	Longitudinal hatch coamings of length greater than 0,15L including coaming top plate and flange	Class III within 0,4L amidships Class II outside 0,4L amidships
C9.	End brackets and deck house transition of longitudinal cargo hatch coamings	Class I outside 0,6L amidships Not to be less than Grade D/DH
ADDITIONAL REQUIREMENTS FOR SINGLE STRENGTH DECK SHIPS OF LENGTH GREATER THAN 150 m.		
D1.	Longitudinal plating of strength deck where contributing to the longitudinal strength	Grade B/AH within 0,4L amidships
D2.	Continuous longitudinal plating of strength members above strength deck	
D3	Continuous longitudinal trunk deck plating of membrane type liquefied gas carriers	Class II within 0,4L amidships
D4	Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and strength deck	Grade B/AH within cargo region
ADDITIONAL REQUIREMENTS FOR SHIPS OF LENGTH GREATER THAN 250 m.		

Materials

Part 3, Chapter 2

Section 2

E1.	Sheerstrake (or rounded gunwale) and stringer plate at strength deck, see Note 2	Grade E/EH within 0,4L amidships
E2.	Bilge strake, see Note 2	Grade D/DH within 0,6L amidships
SINGLE SKIN BULK CARRIERS SUBJECTED TO SOLAS REGULATION XII/6.5		
F1.	Lower bracket of ordinary side frame, see Notes 6 and 7	Grade D/DH
F2.	Side shell strakes included totally or partially between the two points located to 0,125l above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate, see Note 7	Grade D/DH
<p>Note 1. Single strakes required to be of Class III and within 0,4L amidships are to have breadths not less than $800 + 5L$ mm, but need not be greater than 1800 mm, unless limited by the geometry of the ship's design.</p> <p>Note 2. Single strakes required to be of Grade E/EH and within 0,4L amidships are to have breadths not less than $800 + 5L$ mm, but need not be greater than 1800 mm, unless limited by the geometry of the ship's design.</p> <p>Note 3. For strength members not mentioned, Grade A/AH may be generally used.</p> <p>Note 4. Steel grade is to correspond to the as-fitted thickness.</p> <p>Note 5. Plating materials for sternframes supporting the rudder and propeller boss, rudders, rudder horns and shaft brackets are, in general, not to be of lower grades than corresponding to Class II. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders) Class III is to be applied.</p> <p>Note 6. The term 'lower bracket' means webs of lower brackets and webs of the lower part of side frames up to the point of 0,125l above the intersection of side shell and bilge hopper sloping plate or inner bottom plate.</p> <p>Note 7. The span of the side frame, l, is defined as the distance between the supporting structures.</p> <p>Note 8. Corner inserts in way of complex openings such as for lifts and side doors which may impinge on the deck plating or stringer plate are to be of Grade D/DH for $t \leq 20$ mm and Grade E/EH for $t > 20$ mm.</p> <p>Note 9. The material class used for reinforcement and the quality of material (i.e. whether mild or higher tensile steel) used for welded attachments, such as waterway bars and bilge keels, is to be similar to that of the hull envelope plating in way. Where attachments are made to rounded gunwale plates, special consideration will be given to the required grade of steel, taking account of the intended structural arrangements and attachment details.</p> <p>Note 10. The material class for deck plating, sheer strake and upper strake of longitudinal bulkhead within 0,4L amidships is also to be applied at structural breaks of the superstructure, irrespective of position.</p> <p>Note 11. Engine seat top plates outside 0,6L amidships may be Grade A/AH. Steel grade requirement for top plates within 0,6L amidships will be specially considered.</p>		

Table 2.2.2: Steel grades

Thickness, t , in mm	Material class					
	I		II		III	
	Mild steel	H.T. steel	Mild steel	H.T. steel	Mild steel	H.T. steel
$t \leq 15$	A	AH	A	AH	A	AH
$15 < t \leq 20$	A	AH	A	AH	B	AH
$20 < t \leq 25$	A	AH	B	AH	D	DH
$25 < t \leq 30$	A	AH	D	DH	D	DH
$30 < t \leq 35$	B	AH	D	DH	E	EH
$35 < t \leq 40$	B	AH	D	DH	E	EH

Materials**Part 3, Chapter 2***Section 3*

$t > 40$	D	DH	E	EH	E	EH
Note See Notes under Table 2.2.1 Material classes and grades						

Table 2.2.3: Grades of steel for refrigerated spaces with a minimum design temperatures below 0°C

Minimum design temperature, in °C	Thickness, in mm	Grades of steel
<0 to –10	$t \leq 12,5$	B/AH
	12,5 $t \leq 25,5$	D/DH
	$t > 25,5$	E/EH
<–10 to –25	$t \leq 12,5$	D/DH
	$t > 12,5$	E/EH
<– 25 to –40	$t \leq 12,5$	E/EH
	$t > 12,5$	FH/LT–FH, see also Ch 3, 6 Ferritic steels for low temperature service of the Rules for Materials

Table 2.2.4: Assessment of deck temperature

Arrangement	Deck temperature
(1) Deck not covered with insulation in the refrigerated space	Temperature of the refrigerated space
(2) Deck covered with insulation in the refrigerated space and not insulated on the other side	Temperature of the space on the uninsulated side
(3) Deck covered with insulation on both sides	
(a) Temperature difference not greater than 11°C	Mean of the temperatures of the spaces above and below the deck
(b) Temperature difference greater than 11°C but not greater than 33°C	Mean of the temperatures of the spaces above and below the deck less 3°C
(c) Temperature difference greater than 33°C	Deck temperature will be specially assessed
Note Where one of the internal spaces concerned is not refrigerated, the temperature of the space is to be taken as 5°C.	

■ Section 3

Corrosion protection

3.1 General

3.1.1 Where bimetallic connections are made, measures are to be incorporated to mitigate galvanic corrosion.

3.2 Prefabrication primers

3.2.1 Prefabrication primers are to be approved in accordance with Ch 15 Corrosion Prevention of the Rules for Materials.

3.2.2 Aluminium coatings intended for oil tankers and chemical tankers used in way of the cargo oil tanks, cargo tank deck areas, pumprooms, cofferdams or any other area where oil vapour may accumulate are to be coated using systems containing less than 10 per cent aluminium by weight in the dry film.

3.3 Internal cathodic protection

3.3.1 The requirements for cathodic protection of internal tanks in Ch 15 Corrosion Prevention of the Rules for Materials are to be complied with. When a cathodic protection system is to be fitted in tanks for the carriage of liquid cargo with flash point not exceeding 60°C, a plan showing details of the locations and attachment of anodes is to be submitted. The arrangements will be considered for safety against fire and explosion aspects only. Impressed current cathodic protection systems are not permitted in any tank.

3.3.2 Particular attention is to be given to the locations of anodes in relation to the structural arrangements and openings of the tank.

3.3.3 Anodes are to be of approved design and sufficiently rigid to avoid resonance in the anode support. Steel cores are to be fitted, and these are to be so designed as to retain the anode even when the latter is wasted.

3.3.4 Anodes are to be attached to the structure in such a way that they remain secure both initially and during service. The following methods of attachment would be acceptable:

- (a) Steel core connected to the structure by continuous welding of adequate section.
- (b) Steel core bolted to separate supports, provided that a minimum of two bolts with lock nuts is used at each support. The separate supports are to be connected to the structure by continuous welding of adequate section.
- (c) Approved means of mechanical clamping.

3.3.5 Anodes are to be attached to stiffeners, or may be aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.

3.3.6 Where cores or supports are welded to the main structure, they are to be kept clear of the toes of brackets and similar stress raisers. Where they are welded to asymmetrical stiffeners, they are to be connected to the web with the welding kept at least 25 mm away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate but well clear of the free edges. However, it is recommended that anodes are not fitted to face plates of higher tensile steel longitudinals.

3.4 Aluminium and magnesium anodes

3.4.1 Aluminium and aluminium alloy anodes are permitted in tanks used for the carriage of oil, but only at locations where the potential energy does not exceed 275 J (28 kgf m). The weight of the anode is to be taken as the weight at the time of fitting, including any inserts and fitting devices.

3.4.2 The height of the anode is, in general, to be measured from the bottom of the tank to the centre of the anode. Where the anode is located on, or closely above, a horizontal surface (such as a bulkhead girder) not less than 1 m wide, provided with an upstanding flange or face plate projecting not less than 75 mm above the horizontal surface, the height of the anode may be measured above that surface.

3.4.3 Aluminium anodes are not to be located under tank hatches or Butterworth openings unless protected by adjacent structure.

3.4.4 Magnesium or magnesium alloy anodes are permitted only in tanks intended solely for water ballast.

3.5 External hull protection

3.5.1 Suitable protection of the underwater portion of the hull is to be provided.

3.5.2 Where a cathodic protection system is fitted, plans showing the proposed layout of anodes and hull penetrations are to be submitted in accordance with Ch 15 Corrosion Prevention of the Rules for Materials.

3.5.3 The arrangement for glands, where cables pass through the shell, are to include a small cofferdam. Cables to anodes are not to be led through tanks intended for the carriage of low flash point oils. Where cables are led through cofferdams or clean ballast tanks of tankers, they are to be enclosed in a substantial steel tube of about 10 mm thickness, see *also* Pt 6, Ch 2, 14.10 Requirements for tankers intended for the carriage in bulk of oil cargoes having a flash point not exceeding 60°C (closed-cup test).

3.5.4 Where an ***IWS** (In-water Survey) notation is to be assigned, see Pt 1, Ch 2, 2.3 Class notations (hull), protection of the underwater portion of the hull is to be provided by means of a suitable high resistance paint applied in accordance with the manufacturer's requirements. Details of the high resistance paint are to be submitted for information in accordance with Ch 15 Corrosion Prevention of the Rules for Materials.

3.6 Application of coatings and alternative means of protection

3.6.1 For ships that are required to comply with IMO Resolution MSC.215(82) Performance Standards for Protective Coatings, (PSPC) , all dedicated sea-water ballast tanks of all types of ships and double-side skin spaces of bulk carriers are to comply with all of the requirements of the Resolution, see ShipRight Procedure *Anti-Corrosion Systems Notation* and Ch 15 Corrosion Prevention of the Rules for Materials.

3.6.2 For ships that are required to comply with IMO Resolution MSC.288(87), Performance Standard for Protective Coatings for Cargo Oil Tanks of Crude Oil Tankers , all cargo oil tanks are to comply with all of the requirements of the Resolution, see ShipRight Procedure *Anti-Corrosion System Notation* and Ch 15 Corrosion Prevention of the Rules for Materials.

3.6.3 For ships that are required to comply with the IMO Resolution MSC.289(87) Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks of Crude Oil Tankers , by application of corrosion resistant steel, see Ch 3, 1.3 Corrosion resistant steels for cargo oil tanks of crude oil tankers of the Rules for Materials, all cargo oil tanks are to comply with all of the requirements of the Resolution, see ShipRight Procedure *Anti-Corrosion System Notation* and Ch 15 Corrosion Prevention of the Rules for Materials.

3.6.4 For ships that are required to comply with IMO Resolution MSC.244(83), Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers , all void spaces are to comply with all of the requirements of the Resolution, see ShipRight Procedure *Anti Corrosion System Notation* and Ch 15 Corrosion Prevention of the Rules for Materials.

3.6.5 For ships that are not required to comply with the IMO Resolution MSC.215(82), Performance Standards for Protective Coatings , all sea-water ballast spaces having boundaries formed by the hull envelope are to have an efficient protective coating, epoxy or equivalent, applied in accordance with the manufacturer's recommendations, see ShipRight Procedure *Protective Coatings in Water Ballast Tanks (PCWBT)* and Ch 15 Corrosion Prevention of the Rules for Materials.

3.6.6 The following tanks are not considered to be dedicated sea-water ballast tanks and are therefore exempted from the application and requirement of the IMO PSPC:

- (a) ballast tanks identified as 'Spaces included in Net Tonnage' in the 1969 ITC Certificate;
- (b) sea-water ballast tanks in passenger vessels also designated for the carriage of grey water or black water; or
- (c) sea-water ballast tanks in livestock carriers also designated for the carriage of the livestock dung.

Alternative provisions are to be made for the protection of these tanks.

■ **Section 4** **Deck covering**

4.1 General

4.1.1 Where plated decks are sheathed with wood or an approved composition, reductions in plate thickness may be allowed.

4.1.2 The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck.

4.1.3 Primary deck coverings within accommodation spaces, control stations or service spaces are to be of a type which will not readily ignite or give rise to smoke or toxic or explosive hazards at elevated temperatures in accordance with the requirements of the *International Code for the Application of Fire Test Procedures*.

Section

- 1 **General**
- 2 **Rule structural concepts**
- 3 **Structural idealisation**
- 4 **Bulkhead requirements**
- 5 **Design loading**
- 6 **Minimum bow heights, reserve buoyancy and extent of forecastle**

■ *Section 1* **General**

1.1 Application

1.1.1 This Chapter illustrates the general principles to be adopted in applying the Rule structural requirements given in Pt 3 Ship Structures (General) and Pt 4 Ship Structures (Ship Types). In particular, consideration has been given to the layout of the Rules as regards the different regions of the ship, principles for taper of hull scantlings, definition of span point, derivation of section moduli and basic design loading for deck structures. Principles for subdivision are also covered.

1.1.2 Where additional requirements relating to particular ship types apply, these are, in general, dealt with under the relevant ship type Chapter in Pt 4 Ship Structures (Ship Types).

1.1.3 The requirements in this chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation (see Pt 1, Ch 2, 2.3 Class notations (hull)) with the exception of Pt 3, Ch 3, 4.7 Protection of tanks carrying fuel oil, lubricating oil, vegetable or similar oils which is to be complied with.

■ *Section 2* **Rule structural concepts**

2.1 Definition of requirements

2.1.1 In Figure 3.2.1 Rule Scantlings - Schematic layout of requirements the breakdown of the ship into regions is shown. Within each region, the applicable Parts and Chapters of the Rules are indicated.

2.2 Definition of fore end region

2.2.1 The fore end region structure is considered to include structure forward of the midship 0,4L region.

2.3 Definition of aft end region

2.3.1 The aft end region structure is considered to include all structure aft of the midship 0,4L region.

2.4 Symbols

2.4.1 The symbols used in this Section are defined as follows:

F_D, F_B = local scantling reduction factor as defined in Pt 3, Ch 4, 5.7 Local reduction factors

k_L, k = higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel

z_D, z_B = vertical distance, in metres, from the hull transverse neutral axis to the moulded deck line at side and to the top of keel respectively

z_{ht} = vertical extent of higher tensile steel.

2.5 Taper requirements for hull envelope

2.5.1 The thickness of the shell envelope and strength deck plating, and the modulus and sectional area of strength deck longitudinals are to taper gradually from the midship region to the fore and aft ends. For the requirements, see Table 3.2.1 Taper requirements for hull envelope.

2.5.2 Outside the line of openings where higher tensile steel is used amidships and mild steel at the ends, the equivalent mild steel midship thickness for plating, equivalent mild steel midship deck longitudinal area and equivalent mild steel midship total deck area, for taper purposes are to be determined as follows:

(a) Equivalent mild steel value

$$= \frac{\text{H.T. steel value}}{k_L}$$

(b) If the higher tensile steel plating is based on minimum thickness requirements, then:

Equivalent mild steel midship plating thickness determined from Pt 4, Ch 1 General Cargo Ships and Pt 4, Ch 9 Double Hull Oil Tankers.

2.5.3 The transition from higher tensile steel to mild steel is to be as shown in Figure 3.2.2 Transition of steel grades for the forward region. The transition in the aft region is to be similar to the forward region.

2.5.4 Where the higher tensile steel longitudinals extend beyond the point of transition from higher tensile to mild steel plating, the modulus of the composite section is not to be taken less than the required mild steel value at the deck plate flange, and k times the mild steel value at the higher tensile flange.

2.6 Vertical extent of higher tensile steel

2.6.1 Higher tensile steel may be used for both deck and bottom structures or deck structure only. Where fitted, it is to be used for the whole of the longitudinal continuous material for the following vertical distances:

(a) from the line of deck at side

$$z_{ht} = \left(1 - \frac{k_L}{F_D}\right) z_D$$

(b) from the top of keel

$$z_{ht} = \left(1 - \frac{k_L}{F_B}\right) z_B$$

In the above formulæ F_D and F_B are to be taken not less than k_L .

Structural Design

Part 3, Chapter 3

Section 2

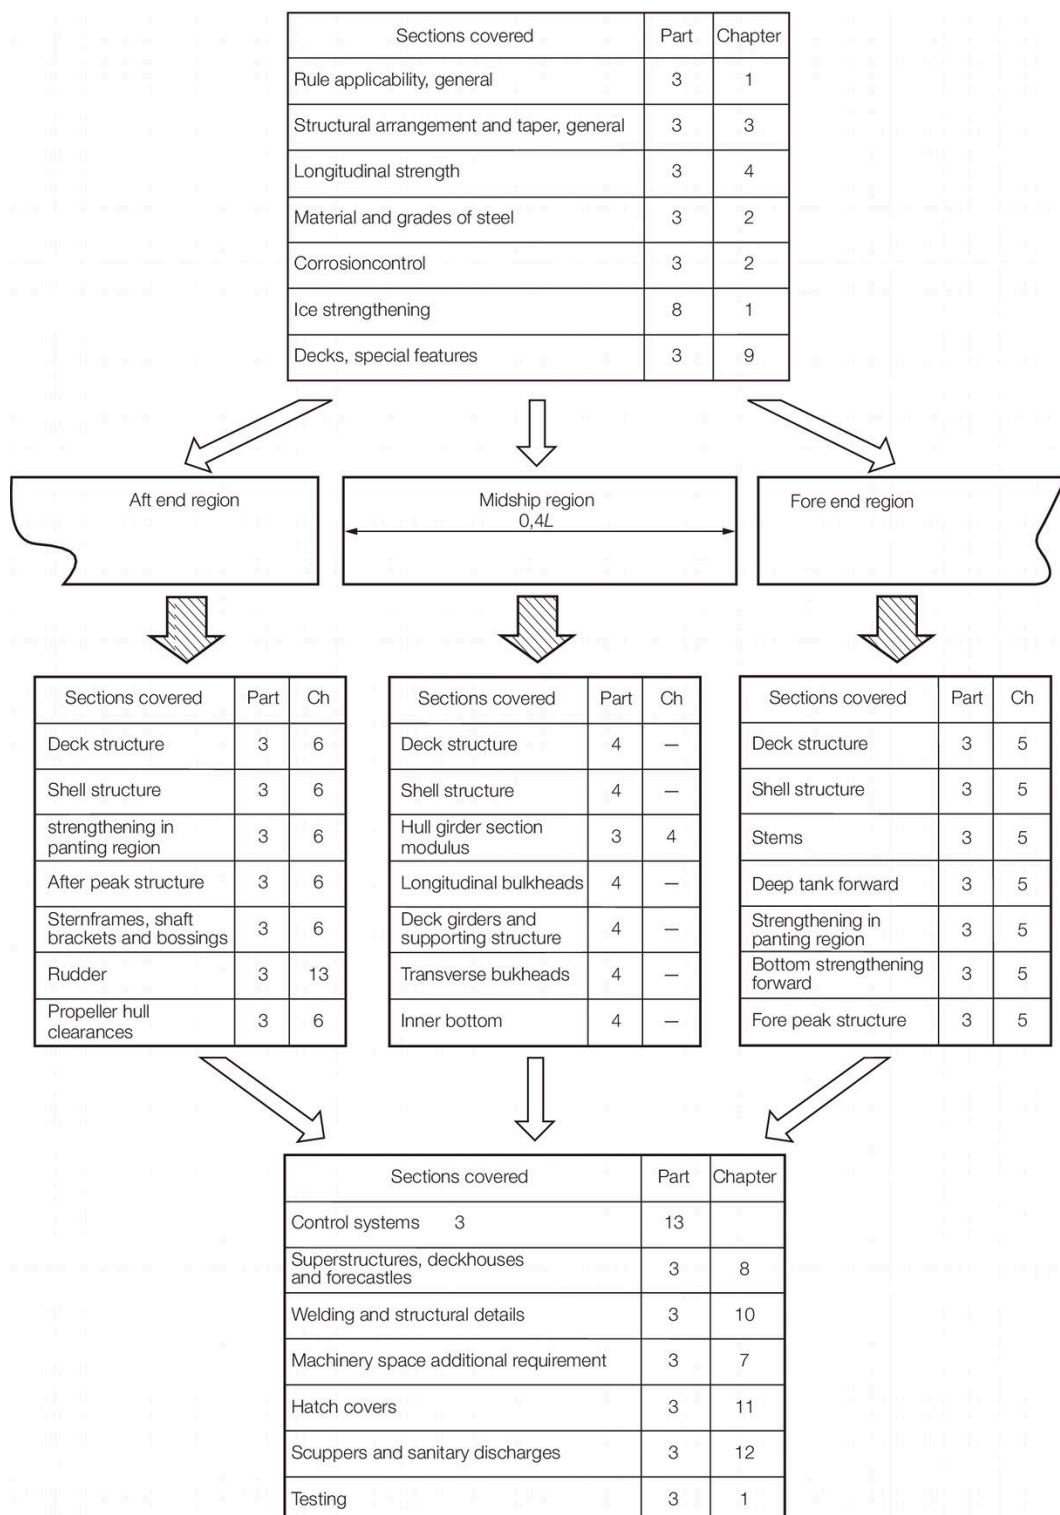

Figure 3.2.1: Rule Scantlings - Schematic layout of requirements

Table 3.2.1: Taper requirements for hull envelope

Item	Location	Requirement
Plating		
(1) Shell envelope plating, see Notes 1 and 2	Fore and aft ends	<p>The thickness, in mm, is to be the greater of the following:(a)</p> $t_t = \left[(t_c - t_{e1}) \left(1 - \frac{d}{0,225L} \right) + t_{e1} \right] \quad (\text{see Note 3})$ <p>(b) $t_t = (6,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}}$</p>
(2) Strength deck plating, see Notes 1 and 2	Fore and aft ends	<p>The thickness, in mm, is to be the greater of the following:</p> <p>(a) $t_t = \left[(t_c - t_{e2}) \left(1 - \frac{d}{0,225L} \right) + t_{e2} \right] \quad (\text{see Note 3})$</p> <p>(b) $t_t = (5,5 + 0,02L) \sqrt{\frac{ks_1}{s_b}}$</p>
Longitudinals outside 0,4L amidships		
(3) Strength deck, see Notes 1 and 2	Fore and aft ends	<p>MODULUSThe section modulus in association with deck plating, in cm³, is to be the greater of the following:</p> <p>(a) $Z_t = \left[(Z_c - Z_e) \left(1 - \frac{d}{0,225L} \right) + Z_e \right] \quad (\text{see Note 3})$</p> <p>(b) As determined by Table 5.2.3 Strength/weather deck longitudinals forward, Table 6.2.3 Strength/weather deck longitudinals aft, and Pt 4, Ch 9 Double Hull Oil Tankers, as appropriate</p> <p>SECTIONAL AREA</p> <p>The deck longitudinals may be gradually tapered outside the 0,4L midships region in association with the deck plating on the basis of area.</p> <p>The sectional area of one longitudinal without plating, in cm², is to be not less than the following:</p> $A_t = \left[(A_c - A_e) \left(1 - \frac{d}{0,225L} \right) + A_e \right] \quad (\text{see Note 3})$
Strength deck area		
(4) Deck area taper, see Notes 1 and 2	Fore and aft decks	<p>The total area of longitudinals and deck plating outside line of openings at midship region should have a linear taper from 0,2L from midships to 0,075L from F.P. or A.P. such that the area at 0,075L and 0,15L from the F.P. or A.P. is not less than 30 and 50 per cent respectively of the total midships area, see Note 3.</p>
Symbols		
<p><i>L</i>, <i>k</i>, <i>s</i> as defined in Pt 3, Ch 5, 1.4 Symbols and definitions</p> <p><i>d</i> = distance, in m, from 0,2L forward or aft of amidships to the mid-length of the building block, strake, or longitudinal under consideration</p> <p><i>s_b</i> = standard frame spacing, in mm, as given in Table 5.2.1 Strength/weather deck plating forward (excluding forecastle deck) and Table 5.3.1 Shell plating forward in Chapter 5, and Table 6.2.1 Strength/weather deck plating aft (excluding poop deck) and Table 6.3.1 Shell plating aft in Chapter 6, as appropriate</p> <p><i>s₁</i> = <i>s</i>, but is to be taken not less than <i>s_b</i></p>		

t_c = actual thickness of deck or shell plating within the $0,4L$ midships region

t_{e1} = basic shell end thickness for taper and is $(6,5 + 0,033L) \sqrt{k}$ at $0,075L$ from the A.P. or F.P.

t_{e2} = basic strength deck end thickness for taper and is $(5,5 + 0,02L) \sqrt{k}$ at $0,075L$ from the A.P. or F.P.

t_t = taper thickness for strength deck and shell plating

Z_c = section modulus of deck longitudinal in association with deck plating, in cm^3 , within the $0,4L$ midships region

Z_e = section modulus of deck longitudinal in association with deck plating in cm^3 , at $0,075L$ from the ends

Z_t = taper section modulus of deck longitudinal in association with deck plating, in cm^3

A_c = cross-sectional area of one longitudinal without attached plating, in cm^2 , within the $0,4L$ midships region

A_e = cross-sectional area of one longitudinal without attached plating, in cm^2 , at $0,075L$ from the ends

A_t = taper cross-sectional area of one longitudinal without attached plating, in cm^2

Note 1. For thickness of strength deck and shell plating in way of cargo tanks of double hull oil tankers, single hull oil tankers or ore carriers, see *also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers, or Pt 4, Ch 11 Ore Carriers as appropriate.

Note 2. The taper requirement does not apply to container ships or open type ships, see Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. See *also* Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.

Note 3. The formulae for the taper values are based on the assumption that the quality of steel is the same at amidships and ends. Where higher tensile steel is used in the midship region and mild steel at the ends, the taper values should be calculated for both qualities of steel in way of the transition from higher tensile to mild steel, and applied as determined by Pt 3, Ch 3, 2.5 Taper requirements for hull envelope and Pt 3, Ch 3, 2.5 Taper requirements for hull envelope.

2.7 Grouped stiffeners

2.7.1 Where stiffeners are arranged in groups of the same scantling, the section modulus requirement of each group is to be based on the greater of the following:

- the mean value of the section modulus required for individual stiffeners within the group,
- 90 per cent of the maximum section modulus required for individual stiffeners within the group.

Section 3 Structural idealisation

3.1 General

3.1.1 For derivation of scantlings of stiffeners, beams, girders, etc. the formulae in the Rules are normally based on elastic or plastic theory using simple beam models supported at one or more points and with varying degrees of fixity at the ends, associated with an appropriate concentrated or distributed load.

3.1.2 Apart from local requirement for web thickness or flange thicknesses, the stiffener, beam or girder strength is defined by a section modulus and moment of inertia requirement.

3.2 Geometric properties of section

3.2.1 The symbols used in this sub-Section are defined as follows:

b = the actual width, in metres, of the load-bearing plating, i.e. one-half of the sum of spacings between parallel adjacent members or equivalent supports

f = $0,3 \left(\frac{1}{b} \right)^{2/3}$, but is not to exceed 1,0. Values of this factor are given in Table 3.3.1 Load bearing plating factor

l = the overall length, in metres, of the primary support member, see Figure 3.3.3 Span points

t_p = the thickness, in mm, of the attached plating. Where this varies, the mean thickness over the appropriate span is to be used.

Table 3.3.1: Load bearing plating factor

$\frac{l}{b}$	f	$\frac{l}{b}$	f
0,5	0,19	3,5	0,69
1,0	0,30	4,0	0,76
1,5	0,39	4,5	0,82
2,0	0,48	5,0	0,88
2,5	0,55	5,5	0,94
3,0	0,62	6 and above	1,00

Note Intermediate values to be obtained by linear interpolation.

3.2.2 The effective geometric properties of rolled or built sections may be calculated directly from the dimensions of the section and associated effective area of attached plating. Where the web of the section is not normal to the attached plating, and the angle exceeds 20°, the properties of the section are to be determined about an axis parallel to the attached plating.

3.2.3 The geometric properties of rolled or built stiffener sections and of swedges are to be calculated in association with effective area of attached load bearing plating of thickness t_p mm and of width 600 mm or $40t_p$ mm, whichever is the greater. In no case, however, is the width of plating to be taken as greater than either the spacing of the stiffeners or the width of the flat plating between swedges, whichever is appropriate. The thickness, t_p , is the actual thickness of the attached plating. Where this varies, the mean thickness over the appropriate span is to be used.

3.2.4 The effective section modulus of a corrugation over a spacing p is to be calculated from the dimensions and, for symmetrical corrugations, may be taken as:

$$Z = \frac{d_w}{6000} (3bt_p + ct_w) \text{ cm}^3$$

where d_w , b , t_p , c and t_w are measured, in mm, and are as shown in Figure 3.3.1 Corrugation dimensions. The value of b is to be taken not greater than:

$$50t_p\sqrt{k} \text{ for welded corrugations}$$

$$60t_p\sqrt{k} \text{ for cold formed corrugations}$$

The value of θ is to be not less than 40°. The moment of inertia is to be calculated from:

$$I = \frac{Z}{10} \left(\frac{d_w}{2} \right) \text{ cm}^4$$

Figure 3.3.1: Corrugation dimensions

3.2.5 The section modulus of a double plate bulkhead over a spacing b may be calculated as:

$$Z = \frac{d_w}{6000} (6fbt_p + d_w t_w) \text{ cm}^3$$

where d_w , b , t_p and t_w are measured, in mm, and are as shown in Figure 3.3.2 Double plate bulkhead dimensions.

Figure 3.3.2: Double plate bulkhead dimensions

3.2.6 The effective section modulus of a built section may be taken as:

$$Z = \frac{ad_w}{10} + \frac{t_w d_w^2}{6000} \left(1 + \frac{200(A - a)}{200A + t_w d_w} \right) \text{ cm}^3$$

where

a = the area of the face plate of the member, in cm^2

d_w = the depth, in mm, of the web between the inside of the face plate and the attached plating. Where the member is at right angles to a line of corrugations, the minimum depth is to be taken

t_w = the thickness of the web of the section, in mm

A = the area, in cm^2 , of the attached plating, see Pt 3, Ch 3, 3.2 Geometric properties of section. If the calculated value of A is less than the face area a , then A is to be taken as equal to a .

3.2.7 The geometric properties of primary support members (i.e. girders, transverses, webs, stringers, etc.) are to be calculated in association with an effective area of attached load bearing plating, A , determined as follows:

(a) For a member attached to plane plating:

$$A = 10fbt_p \text{ cm}^2$$

(b) For a member attached to corrugated plating and parallel to the corrugations:

$$A = 10bt_p \text{ cm}^2$$

See Figure 3.3.1 Corrugation dimensions

(c) For a member attached to corrugated plating and at right angles to the corrugations:

A = is to be taken as equivalent to the area of the face plate of the member.

3.3 Determination of span point

3.3.1 The effective length, l_e , of a stiffening member is generally less than the overall length, l , by an amount which depends on the design of the end connections. The span points, between which the value of l_e is measured, are to be determined as follows:

(a) For rolled or built secondary stiffening members:

The span point is to be taken at the point where the depth of the end bracket, measured from the face of the secondary stiffening member is equal to the depth of the member. Where there is no end bracket, the span point is to be measured

between primary member webs. For double skin construction, the span may be reduced by the depth of primary member web stiffener, see Figure 3.3.3 Span points.

- (b) For primary support members:

The span point is to be taken at a point distant from the end of the member,

$$where b_e = b_b \left(1 - \frac{d_w}{d_b} \right)$$

See also Figure 3.3.3 Span points.

3.3.2 Where the end connections of longitudinals are designed with brackets to achieve compliance with the *ShipRight FDA procedure*, no reduction in span is permitted for such brackets unless the fatigue life is subsequently re-assessed and shown to be adequate for the resulting reduced scantlings.

3.3.3 Where the stiffener member is inclined to a vertical or horizontal axis and the inclination exceeds 10°, the span is to be measured along the member.

3.3.4 It is assumed that the ends of stiffening members are substantially fixed against rotation and displacement. If the arrangement of supporting structure is such that this condition is not achieved, consideration will be given to the effective span to be used for the stiffener.

3.4 Calculation of hull section modulus

3.4.1 All continuous longitudinal structural material is to be included in the calculation of the inertia of the hull midship section, and the lever z is, except where otherwise specified for particular ship types, to be measured vertically from the neutral axis to the top of keel and to the moulded strength deck line at the side. The strength deck is to be taken as follows:

- (a) Where there is a complete upper deck and no effective superstructure, the strength deck is the upper deck.
- (b) Where the upper deck is stepped, as in the case of raised quarterdeck ships, or there is an effective superstructure on the upper deck, the strength deck is stepped as shown in Figure 3.3.4 Strength deck stepping.

3.4.2 An effective superstructure is one which exceeds $0,15L$ in length and extends inside the midship $0,5L$ region. Superstructure decks less than 12 m in length are not to be considered as strength deck.

3.4.3 Openings having a length in the fore and aft directions exceeding 2,5 m or $0,1B$ m or a breadth exceeding 1,2 m or $0,04B$ m, whichever is the lesser, are always to be deducted from the sectional areas used in the section modulus calculation.

3.4.4 Smaller openings (including manholes, lightening holes, single scallops in way of seams, etc.) need not be deducted provided they are isolated and the sum of their breadths or shadow area breadths (see Pt 3, Ch 3, 3.4 Calculation of hull section modulus), in one transverse section does not reduce the section modulus at deck or bottom by more than 3 per cent.

3.4.5 Where B_1 equals the breadth of the ship at the section considered and Σb_1 equals the sum of breadths of deductible openings, the expression $0,06 (B_1 - \Sigma b_1)$ may be used for deck openings in lieu of the 3 per cent limitation of reduction of section modulus in Pt 3, Ch 3, 3.4 Calculation of hull section modulus.

Figure 3.3.4: Strength deck stepping

3.4.6 Where a large number of openings are proposed in any transverse space, special consideration will be required.

3.4.7 When calculating deduction-free openings, the openings are assumed to have longitudinal extensions as shown by the shaded areas in Figure 3.3.5 Deduction free openings shadow areas. The shadow area is obtained by drawing two tangent lines to an opening angle of 30° . The section to be considered should be perpendicular to the centreline of the ship and should result in the maximum deduction in each transverse space.

3.4.8 Isolated openings in longitudinals or longitudinal girders need not be deducted if their depth does not exceed 25 per cent of the web depth with a maximum depth for scallops of 75 mm.

3.4.9 Openings are considered isolated if they are spaced not less than 1 m apart.

3.4.10 For compensation that may be required for openings, see individual ship Chapters.

3.4.11 Where trunk decks or continuous hatch coamings are effectively supported by longitudinal bulkheads or deep girders, they are to be included in the longitudinal sectional area when calculating the hull section modulus. The lever z_t is to be taken as:

$$z_t = z_c(0,9 + 0,2 \frac{y}{B}) \text{ m but not less than } z$$

y = horizontal distance from top of continuous strength member to the centreline of the ship, in metres

z = vertical distance from the neutral axis to the moulded deck line at side, in metres

z_c = vertical distance from the neutral axis to the top of the continuous strength member, in metres

z_c and y are to be measured to the point giving the largest value of z_t .

3.4.12 Where continuous hatch coamings are effectively supported (except inboard coamings of multi-hatch arrangements, see Pt 3, Ch 3, 3.4 Calculation of hull section modulus), 100 per cent of their sectional area may be included in the calculation of the hull section modulus.

**Figure 3.3.5: Deduction free openings shadow areas**

3.4.13 Where a continuous longitudinal underdeck girder, or girders, are arranged to support the inboard hatch coamings, 50 per cent of their sectional area may be included. If the girder is fitted in conjunction with a longitudinal centreline bulkhead, 100 per cent of the sectional area may be included. In cases where the girders are enclosed box sections, or where the girders are effectively tied to the bottom structure, the area to be included will be specially considered.

3.4.14 The percentage of the sectional area to be included for inboard continuous hatch side coamings should be the same percentage as that of the longitudinal girder under.

3.4.15 Where continuous deck longitudinals or deck girders are arranged above the strength deck, the sectional area may be included in the calculation of the hull section modulus. The lever is to be taken to a position corresponding to the depth of the longitudinal member above the moulded deckline at side amidships.

■ *Section 4*

Bulkhead requirements

4.1 Number and disposition of bulkheads

4.1.1 All ships are to have a collision bulkhead, an after peak bulkhead, generally enclosing the sterntubes in a watertight compartment, and a watertight bulkhead at each end of the machinery space. Additional watertight bulkheads are to be fitted so that the total number of bulkheads is at least in accordance with Table 3.4.1 Total number of bulkheads.

Table 3.4.1: Total number of bulkheads

Length, L , in metres	Total number of bulkheads	
	Machinery amidships	Machinery aft, see Note
≤ 65	4	3
$> 65 \leq 85$	4	4
$> 85 \leq 90$	5	5
$> 90 \leq 105$	5	5
$> 105 \leq 115$	6	5
$> 115 \leq 125$	6	6
$> 125 \leq 145$	7	6
$> 145 \leq 165$	8	7
$> 165 \leq 190$	9	8
> 190	To be considered individually	
Note With after peak bulkhead forming after boundary of machinery space.		

4.1.2 The bulkheads in the holds should be spaced at reasonably uniform intervals. Where non-uniform spacing is unavoidable and the length of a hold is unusually great, the transverse strength of the ship is to be maintained by fitting web frames, increased framing, etc. and details are to be submitted.

4.1.3 Proposals to dispense with one or more of these bulkheads will be considered, subject to suitable structural compensation, if they interfere with the requirements of a special trade.

4.1.4 Where applicable, the number and disposition of bulkheads are to be arranged to suit the requirements for subdivision, floodability and damage stability, and are to be in accordance with the requirements of the National Authority in the country in which the ship is registered.

4.2 Collision bulkhead

4.2.1 A collision bulkhead shall be fitted which shall be watertight up to the bulkhead deck. This bulkhead shall be located at a distance from the forward side of the stem, on the waterline on which L_L is measured, of not less than $0,05L_L$ or 10 m, whichever is the less, and, except as may be permitted by the Administration, not more than $0,08L_L$ or $0,05L_L + 3$ m, whichever is the greater.

4.2.2 Where any part of the ship below the waterline extends forward of the forward side of the stem, on the waterline on which L_L is measured, e.g. a bulbous bow, the distances stipulated in Pt 3, Ch 3, 4.2 Collision bulkhead are to be measured from a point either:

- (a) at the mid-length of such extension;
- (b) at a distance $0,015L_L$ forward of the forward side of the stem, on the waterline on which L_L is measured; or
- (c) at a distance 3 m forward of the forward side of the stem, on the waterline on which L_L is measured, whichever is the least.

4.2.3 No doors, manholes, access openings, ventilation ducts or any other openings shall be fitted in the collision bulkhead below the bulkhead deck.

4.3 After peak bulkhead

4.3.1 All ships are to have an after peak bulkhead generally enclosing the sterntube and rudder trunk in a watertight compartment. In twin screw ships where the bossing ends forward of the after peak bulkhead, the sterntubes are to be enclosed in suitable watertight spaces inside or aft of the shaft tunnels. The sterntubes are to be enclosed in watertight spaces of moderate volume. In passenger ships, the stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the stern tube compartment and of such volume that, if flooded by leakage through the stern gland, the bulkhead deck will not be submerged.

4.4 Height of bulkheads

4.4.1 The collision bulkhead is normally to extend to the uppermost continuous deck or, in the case of ships with combined bridge and forecastle or a long superstructure which includes a forecastle, to the superstructure deck. However, if a ship is fitted with more than one complete superstructure deck, the collision bulkhead may be terminated at the deck next above the freeboard deck. Where the collision bulkhead extends above the freeboard deck, the extension need only be to weathertight standards.

4.4.2 The after peak bulkhead may terminate at the first deck above the load waterline, provided that this deck is made watertight to the stern or to a watertight transom floor. In passenger ships, the after peak bulkhead is to extend watertight to the bulkhead deck. However, it may be stepped below the bulkhead deck provided the degree of safety of the ship as regards watertight subdivision is not thereby diminished.

4.4.3 The remaining watertight bulkheads are to extend to the freeboard deck. In passenger ships of restricted draught and all ships of unusual design, the height of the bulkheads will be specially considered.

4.5 Watertight recesses, flats and loading ramps

4.5.1 Watertight recesses in bulkheads are generally to be so framed and stiffened as to provide strength and stiffness equivalent to the requirements for watertight bulkheads.

4.5.2 In collision bulkheads, any recesses or steps in the bulkhead are to fall within the limits of bulkhead positions given in Pt 3, Ch 3, 4.2 Collision bulkhead. Where the bulkhead is extended above the freeboard deck or bulkhead deck, the extension need only be to weathertight standards. If a step occurs at that deck, the deck need also only be to weathertight standards in way of the step, unless the step forms the crown of a tank, see Pt 4, Ch 1, 4 Deck structure.

4.5.3 Where bow doors are fitted and a sloping loading ramp forms part of the extension of the collision bulkhead above the bulkhead deck the ramp shall be weathertight over its complete length. In cargo ships the part of the ramp which is more than 2,3 m above the bulkhead deck may extend forward of the limit specified in Pt 3, Ch 3, 4.2 Collision bulkhead or Pt 3, Ch 3, 4.2 Collision bulkhead. Ramps not meeting the above requirements shall be disregarded as an extension of the collision bulkhead.

4.5.4 The number of openings in the extension of the collision bulkhead above the freeboard deck shall be restricted to the minimum compatible with the design and normal operation of the ship. All such openings shall be capable of being closed weathertight.

4.6 Longitudinal subdivision

4.6.1 When timber load lines are to be assigned, double bottom tanks within the midship half-length are to have adequate longitudinal subdivision.

4.7 Protection of tanks carrying fuel oil, lubricating oil, vegetable or similar oils

4.7.1 Tanks carrying fuel oil or lubricating oil are to be separated by cofferdams from those carrying feed water, fresh water, edible oil or similar oils. Similarly, tanks carrying vegetable or similar oils are to be separated from those carrying fresh or feed water.

4.7.2 Lubricating oil compartments are also to be separated by cofferdams from those carrying fuel oil. However these cofferdams need not be fitted provided that:

- (a) Common boundaries of lubricating oil and fuel oil tanks have full penetration welds.
- (b) The tanks are arranged such that the fuel oil tanks are not generally subjected to a head of oil in excess of that in the adjacent lubricating oil tanks.

4.7.3 Cofferdams are not required between fuel oil double bottom tanks and deep tanks above, provided that the inner bottom plating is not subjected to a head of fuel oil.

4.7.4 Where fitted, cofferdams are to be suitably ventilated.

4.7.5 If fuel oil tanks are necessarily located within or adjacent to the machinery spaces, their arrangement is to be such as to avoid direct exposure of the bottom from rising heat resulting from an engine room fire, see SOLAS 1974 as amended Reg. II-2/ B4.2.2.3.2.

4.7.6 In passenger ships, water ballast is, in general, not to be carried in tanks intended for fuel oil. Attention is drawn to the Statutory Regulations issued by National Authorities in connection with the *International Convention for the Prevention of Pollution of the Sea by Oil*, 1973/78.

4.7.7 For vessels which do not comply with the accidental fuel oil outflow performance standard given in MARPOL Annex 1, Regulation 12A-11, fuel oil tanks are to be bounded by double bottom and double side tanks or void spaces such that the distance between the fuel oil tank boundary and the shell plating is not less than that given in Table 3.4.2 Fuel oil tank boundary requirements and Figure 3.4.1 Fuel oil tank boundary lines. For double hull oil tankers where the requirements of Pt 4, Ch 9, 1.2 Application and ship arrangement conflict with this requirement Pt 4, Ch 9, 1.2 Application and ship arrangement is to take precedent. Alternatively the accidental oil outflow performance standard specified in MARPOL Annex 1 Regulation 12A may be complied with.

Table 3.4.2: Fuel oil tank boundary requirements

Fuel oil tank capacity (C), m^3	Minimum double side width (d_s) metres	Minimum double bottom depth (d_b) metres
$C \geq 5000$	$d_s = 0,5 + \frac{C}{20000}$ or $d_s = 2,0$ whichever is the lesser, but not less than 1,0	$d_b = \frac{B}{20}$ or $d_b = 2,0$ whichever is the lesser, but not less than 0,76
$600 \leq C < 5000$	$d_s = 0,4 + \frac{2,4C}{20000}$ or $d_s = 1,0$ whichever is the greater, see Note	$d_b = \frac{B}{20}$ or $d_b = 2,0$ whichever is the lesser, but not less than 0,76
$C < 600$	$d_s = 0$	$d_b = 0$
Symbols		
<p>C = the ship's total volume of fuel oil, including that of small fuel oil tanks, in m^3, at 98 per cent tank filling</p> <p>d_b = the distance, in metres, between the bottom of the fuel oil tank and the moulded line of the bottom shell plating. In the turn of bilge area and at locations without a clearly defined turn of bilge, the fuel oil tank boundary line shall run parallel to the line of the midship flat bottom as shown in Figure 3.4.2 Definition of d_b</p> <p>d_s = the distance, in metres, between the side of the fuel oil tank and the moulded line of the side shell plating, see Figure 3.4.1 Fuel oil tank boundary lines</p>		
<p>Note 1. However, for individual tanks with an fuel oil capacity of less than 500 m^3, the minimum distance is 0,76 m.</p> <p>Note 2. Fuel oil tanks with a maximum individual capacity not greater than 30 m^3 need not comply with the requirements of this Table, provided the aggregate capacity of such excluded tanks is not greater than 600 m^3.</p> <p>Note 3. Suction wells in fuel oil tanks may protrude into the double bottom below the boundary line defined by the distance d_b, provided that such wells are as small as practicable and the distance between the well bottom and the bottom shell plating is not less than $0,5d_b$.</p>		

**Figure 3.4.1: Fuel oil tank boundary lines**

**Figure 3.4.2: Definition of d_b**

4.7.9 No individual fuel oil tank is to have a capacity greater than 2,500 m³.

4.8 Watertight tunnels and passageways

4.8.1 Where a machinery space is situated with a compartment or compartments between it and the after peak bulkhead, the shafting is to be enclosed in a watertight tunnel large enough to permit proper examination and repair of shafting. A sliding watertight door, capable of being operated locally from both sides, is to be provided at the forward end of the tunnel. Consideration may, however, be given to the omission of the watertight door, subject to satisfactory compliance with any relevant statutory requirements. Where two or more shafts are fitted, the tunnels shall be connected by an interconnecting passage. There shall be only one door between the machinery space and the tunnel spaces where two shafts are fitted and only two doors where there are more than two shafts.

4.8.2 Pipe tunnels are to have dimensions adequate for reasonable access.

4.8.3 Where fore and aft underdeck passageways are arranged at the ship's side, the after access thereto is to be by a watertight trunk led to the upper deck. Alternative arrangements to prevent the engine room being flooded, in the event of a collision or if the passageway doors are left open, will be considered.

4.9 Means of escape

4.9.1 For the requirements for means of escape, see SOLAS 1974 as amended Reg. II-2/D, 13.

4.10 Oil tankers

4.10.1 For subdivision requirements within the cargo tank region for oil tankers, see Pt 4, Ch 9, 1 General.

■ **Section 5** **Design loading**

5.1 General

5.1.1 This Section contains the design heads/pressures to be used in the derivation of scantlings for decks, tank tops and transverse bulkheads. These are given in Table 3.5.1 Design heads and permissible cargo loadings.

Structural Design**Part 3, Chapter 3***Section 5***Table 3.5.1: Design heads and permissible cargo loadings**

Structural item and position	Component	Standard stowage rate C , in m^3/tonne	Design loading p , in kN/m^2	Equivalent design head h_1 in metres	Permissible cargo loading in kN/m^2	Equivalent permissible head, in metres

Note 1. In the case of beams and longitudinals, the equivalent design head is to be used in conjunction with the appropriate formulæ.

Note 2. For forecastle decks forward of 0,12L from F.P., see Weather decks.

Note 3. For hatch covers of non-CSR bulk carriers, ore carriers and combination carriers, see Pt 4, Ch 7, 12 Steel hatch covers.

Note 4. For hatch covers of ship types excluding non-CSR bulk carriers, ore carriers and combination carriers, see Pt 3, Ch 11, 2 Steel hatch covers.

Note 5. For pontoon hatch covers, see Pt 3, Ch 11, 2.17 Pontoon covers.

5.2 Symbols

5.2.1 The symbols used in this Section are defined as follows:

L , L_{pp} , C_b , B , D and T as defined in Pt 3, Ch 1, 6.1 Principal particulars

h_i = appropriate design head, in metres

l_e = span of stiffener

p = design loading, in kN/m² (tonne-f/m²)

p_a = applied loading, in kN/m² (tonne-f/m²)

C = stowage rate, in m³/tonne

= $\frac{h_i}{p}$ generally

= volume of the hold, in m³ excluding the volume contained within the depth of the cargo hatchway, divided by the weight of cargo, in tonnes, stowed in the hold, for inner bottom

E = correction factor for height of platform

= $\frac{0,0914 + 0,003L}{D - T} - 0,15$, but not less than zero nor more than 0,147

H = height from tank top to deck at side, in metres

H_c = 'tween deck height measured vertically on the centreline of the ship from 'tween deck to underside of hatch cover stiffeners on deck above, in metres

H_{td} = cargo head in 'tween deck, in metres, as defined in Figure 3.5.1 Heads for 'tween decks.

Figure 3.5.1: Heads for 'tween decks

(a) Heads for watertight and deep tank bulkheads in intact condition

(b) Heads for watertight bulkheads in damaged condition

Figure 3.5.2: Heads for watertight and deep tank bulkheads

5.2.2 The following symbols and definitions apply in particular to the design pressures for partially filled tanks:

L_{pp} and C_b as defined in Pt 3, Ch 1, 6.1 Principal particulars

b = height of internal primary bottom members, in metres

F = fill height, in metres

F_r = effective filling ratio

$$= \frac{\pi}{L_s} \left(F - b \sqrt{\frac{n}{n+1}} \right)$$

GM = transverse metacentric height, in metres, including free surface correction, for the loading condition under consideration

H_t = tank depth, in metres, measured from the bottom of the tank to the underside of the deck at side. In the case of holds, the depth is measured from the inner bottom to the underside of the deck at hatch side, except in double skin ships with hatch coaming in line with the inner skin, in which case, the depth is measured to the top of the hatch coaming

n = number of internal primary bottom members

L_s = the effective horizontal free surface length, in metres, in the direction of angular motion (i.e. tank breadth for roll, tank length for pitch)

S_{nr} = ship's natural rolling period

$$= \frac{2,35r}{\sqrt{GM}} \text{ seconds}$$

= for ships for which either r or GM varies significantly between loading conditions (for example, bulk carriers and tankers, see Pt 3, Ch 3, 1.1 Application), S_{nr} should be evaluated for each representative loading condition considered

r = radius of gyration of roll, in metres, and may be taken as $0,34B$

S_{np} = ship's natural pitching period

$$= 3,5\sqrt{TC_b} \text{ seconds}$$

= for ships for which either T or C_b varies significantly between loading conditions (for example, bulk carriers and tankers, see Pt 3, Ch 3, 1.1 Application), S_{np} should be evaluated for each representative loading condition considered

T_{np} = fluid natural period of pitch

$$= \sqrt{\frac{4\pi L_s}{g \cdot \tanh(F_r)}} \text{ seconds}$$

T_{nr} = fluid natural period of roll

$$= \sqrt{\frac{4\pi L_s}{g \cdot \tanh(F_r)}} \text{ seconds}$$

θ_{\max} = maximum 'lifetime' pitch angle, in degrees:

$$= (32,7 - 8,2C_b) e^{-0,001L_{pp}} (4,9 + 0,5C_b)$$

φ_{\max} = maximum 'lifetime' roll angle, in degrees:

$$= \left(14,8 + 3,7 \frac{L_{pp}}{B} \right) e^{-0,0023L_{pp}}$$

5.3 Stowage rate and design loads

5.3.1 Unless it is specifically requested otherwise, the following standard stowage rates are to be used:

- (a) 1,39 m³/tonne for weather or general cargo loading on deck and inner bottom.
- (b) 0,975 m³/tonne for liquid cargo of density of 1,025 tonne/m³ or less on watertight and tank divisions. For liquid of density greater than 1,025 tonne/m³ the corresponding stowage rates are to be adopted.

5.3.2 Proposals to use a stowage rate greater than 1,39 m³/tonne for permanent structure will require special consideration, and will normally be accepted only in the case of special purpose designs such as fruit carriers, etc.

5.3.3 The design head and permissible cargo loading are shown in Table 3.5.1 Design heads and permissible cargo loadings.

5.4 Design pressure for partially filled tanks

5.4.1 When partial filling of tanks or holds is contemplated for sea-going conditions, the risk of significant loads due to sloshing induced by any of the ship motions is to be considered. An initial assessment is to be made to determine whether or not a higher level of sloshing investigation is required, using the following procedure which corresponds to the Level 1 investigation outlined in the *SDA Procedure for Sloshing loads and scantling assessment*, on tanks partially filled with liquids.

5.4.2 In general, significant dynamic magnifications of the sloshing pressures are considered unlikely for the following cases:

- (a) For internally stiffened tanks:
 - (i) Where two (or more) deck girders (in the case of rolling) or deck transverses (in the case of pitching) are located not more than 25 per cent of the tank breadth or length respectively from the adjacent tank boundary, and the fill level is greater than the tank depth minus the height of the deck girders or transverses;
 - (ii) Where the deck girders or transverses, at any location, are less than 10 per cent of the tank depth, and the fill level is greater than the tank depth minus the height of the deck girders or transverses;
 - (iii) Where the fill level is less than the height of any bottom girders or transverses.
- (b) For smooth tanks:

where the fill level is less than 10 per cent or more than 97 per cent of the tank depth.

5.4.3 Significant dynamic magnification of the fluid motions, and hence the sloshing pressure, can occur if either of the following conditions exist:

- (a) The natural rolling period, T_{nr} , of the fluid and the ship's natural rolling period, S_{nr} , are within five seconds of each other.
- (b) The natural pitching period, T_{np} , of the fluid is greater than a value of three seconds below the ship natural pitching period, S_{np} .

These values define the limits of the critical fill range for each tank.

5.4.4 The critical fill range, F_{crit} , is to be determined using the following formula:

$$F_{crit} = \left(\frac{100}{H_t} \right) \left[\left(\frac{L_s}{2\pi} \right) \ln \left(\frac{1+\eta}{1-\eta} \right) + b \sqrt{\frac{n}{n+1}} \right] \%$$

where

\ln = natural logarithm to base e

$$\eta = \frac{4\pi L_s}{[(S_{nr} - 5)^2 g]} \text{ for fill level at } S_{nr} - 5 \text{ seconds upper bound roll critical fill level}$$

$$\text{or } \eta = \frac{4\pi L_s}{[(S_{nr} + 5)^2 g]} \text{ for fill level at } S_{nr} + 5 \text{ seconds lower bound roll critical fill level}$$

$$\text{or } \eta = \frac{4\pi L_s}{[(S_{np} - 3)^2 g]} \text{ for fill level at } S_{np} - 3 \text{ seconds upper bound pitch critical fill level}$$

where

$$\text{or } \eta = \frac{4 \pi L_s}{[(S_{np})^2 g]} \text{ for fill level at } S_{np} \text{ seconds}$$

The lower bound pitch critical fill level is 0,1 per cent fill. The value of F_{crit} is limited to the range 0 to 100 per cent, see also Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks.

5.4.5 The natural periods of the ship for a given motion type are to be determined for the service loading conditions agreed between the Shipbuilder and Lloyd's Register. From this aspect, the storm-ballast and the segregated ballast conditions and the condition with all tanks partially filled could be the most critical.

5.4.6 When a ship is to be approved for Unrestricted Filling Levels - Unspecified Loading Conditions, many arbitrary ship loading conditions are possible. In order to cover the complete range of loading conditions, the fully loaded and ballast conditions are to be considered. These two conditions give an upper and lower limit for the possible range of natural periods of the ship as shown in Figure 3.5.3 Natural periods diagrams. Both the roll and pitch motion modes are to be examined.

Because of the unrestricted filling level requirement, the critical sloshing ranges extend from $[S_{nrBallast} - 5]$ to $[S_{nrLoaded} + 5]$ seconds in roll and from $[S_{npBallast} - 3]$ to $[S_{npLoaded}]$ in pitch. Also, because of unrestricted filling levels, the ship natural period range extends from $[S_{nBallast}]$ to $[S_{nLoaded}]$ for both pitch and roll.

For sloshing in the roll motion mode shown in Figure 3.5.3 Natural periods diagrams, the critical fill range extends from F_1 to F_4 . All fill levels between F_1 and F_4 are to be investigated:

- For fill levels between F_1 and F_2 , $S_{nrBallast}$ is to be used.
- For fill levels between F_3 and F_4 , $S_{nrLoaded}$ is to be used.
- For fill levels between F_2 and F_3 , S_{nr} is to be equal to T_{nr} .

Similarly, for sloshing in the pitch motion mode shown in Figure 3.5.3 Natural periods diagrams, the critical fill range extends from F_1 to F_4 . All fill levels between F_1 and F_4 are to be investigated.

- For fill levels between F_1 and F_2 , $S_{npBallast}$ is to be used.
- For fill levels between F_2 and F_3 , S_{np} is to be equal to T_{np} .
- For fill levels between F_3 and F_4 , $S_{np loaded}$ is to be used.

**Figure 3.5.3: Natural periods diagrams**

5.4.7 When a ship is to be approved for Restricted Filling Levels - Unspecified Loading Conditions, many arbitrary ship loading conditions are possible within the restrictions imposed. In order to cover the complete range of loading conditions, the fully loaded and ballast conditions are to be considered. These two conditions give an upper and lower limit for the possible range of ship natural period. It is recognised that there might be ship natural period bands which will not be applicable as a result of the limitations on the fill levels. However, it is recommended that the Unrestricted Filling Levels - Unspecified Loading Conditions procedure outlined in Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks be applied.

5.4.8 When a ship is to be approved for Unrestricted Filling Levels - Specified Loading Conditions, each specified loading condition is to be examined for the complete fill ranges to determine the critical sloshing fill range for each tank in both roll and pitch motion modes.

5.4.9 When a ship is to be approved for Restricted Filling Levels - Specified Loading Conditions, each specified loading condition is to be examined for the restricted fill ranges to determine the critical sloshing fill range for each tank in both roll and pitch motion modes.

5.4.10 Where the assessment indicates that all the intended fill levels are outside the critical fill ranges and, therefore, significant sloshing will not occur, no further evaluation is required with regard to sloshing pressure. In such cases, the scantlings of the tank boundaries are to be determined in accordance with the relevant Rule requirements.

5.4.11 Where the separation of periods defined in Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks is not met, other levels of assessment will be required as given in the *SDA Procedures for sloshing loads and scantling assessment*, on tanks partially filled with liquids.

5.4.12 The structural capability of the tank boundaries to withstand the dynamic sloshing pressures is to be examined. The magnitude of the predicted loads, together with the scantling calculations may be required to be submitted.

■ Section 6

Minimum bow heights, reserve buoyancy and extent of forecastle

6.1 Minimum bow heights

6.1.1 Ships are to comply with the Load Lines conventions, so far as these are applicable.

6.1.2 Bulk carriers, ore carriers and combination carriers are also to comply with the requirements of Pt 4, Ch 7, Pt 4, Ch 7, 14 Forecastles.

6.2 Extent of forecastle

6.2.1 Forecastles are to extend from the stem to a point at least $0,07L_L$ abaft the forward end of L_L (as defined in Pt 3, Ch 1, 6.1 Principal particulars). If the minimum bow height is obtained by increasing the sheer of the upper deck, the sheer is to extend for at least $0,15L_L$ abaft the forward end of L_L .

6.2.2 Bulk carriers, ore carriers and combination carriers are also to comply with the requirements of Pt 4, Ch 7, 14 Forecastles.

6.2.3 Forecastles are to be enclosed; that is with enclosing bulkheads of efficient construction and access openings complying with Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads and all other openings in sides or ends fitted with efficient weathertight means of closing.

■ *Section 1* **Definitions**

1.1 List of symbols

1.1.1 The following symbols definitions are applicable to this Chapter, unless otherwise stated:

$L, B, D,$ = are as defined in Pt 3, Ch 1, 6.1 Principal particulars
 C_b and
 V

k_L, k = higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel

■ *Section 2* **General**

2.1 Longitudinal strength calculations

2.1.1 Longitudinal strength calculations are to be carried out for all ships where L is greater than 65 m, covering the range of load and ballast conditions proposed, in order to determine the required hull girder strength. The calculations of still water shear forces and bending moments are to cover both departure and arrival conditions and any special mid-voyage conditions caused by changes in ballast distribution.

2.1.2 For ships where L is equal to or less than 65 m, longitudinal strength calculations may be required, dependent upon proposed loading.

2.1.3 Specific information regarding required loading conditions is given in the individual ship type Chapters.

2.2 Erections contributing to hull strength

2.2.1 In general, where a long superstructure or deckhouse of length greater than $0,15L$ is fitted, extending within the $0,5L$ amidships, the requirements for longitudinal strength in the hull and erection will be considered in each case.

2.3 Open type ships

2.3.1 For ships other than container ships which have large deck openings and where the structural configuration is such that warping stresses in excess of $14,7 \text{ N/mm}^2$ are likely to occur, local increases in section modulus, based normally on the combined

stress diagram undertaken for container ships, may be required. For calculations for container ships, see Pt 4, Ch 8, 3 Longitudinal strength.

2.3.2 For ships with large deck openings such as containerships, sections at or near to the aft and forward quarter length positions are to be checked. For such ships with cargo holds aft of the superstructure, deckhouse or engine room, strength checks of sections in way of the aft end of the aft-most holds, and the aft end of the deckhouse or engine room are to be performed.

2.4 Ships with large flare

2.4.1 In ships of length between 120 and 170 m and maximum service speed greater than 17,5 knots, in association with a bow shape factor of more than 0,15, the Rule hull midship section modulus and the distribution of longitudinal material in the forward half-length will be specially considered, see Pt 4, Ch 1, 3 Longitudinal strength.

2.5 Direct calculation procedures

2.5.1 In direct calculation procedures capable of deriving the wave induced loads on the ship, and hence the required modulus, account is to be taken of the ship's actual form and weight distribution.

2.5.2 Lloyd's Register's (hereinafter referred to as 'LR') direct calculation method involves derivation of response to regular waves by appropriate sea keeping software, short-term response to irregular waves using the sea spectrum concept, and long-term response predictions using statistical distributions of sea states. Other direct calculation methods submitted for approval should normally contain these three elements and produce similar and consistent results when compared with LR's methods.

2.6 Approved calculation systems

2.6.1 Where the assumptions, method and procedures of a longitudinal strength calculation system have received general approval from LR, calculations using the system for a particular ship may be submitted.

■ **Section 3 Application**

3.1 Symbols

3.1.1 The symbols used in this Section are defined as follows:

b = breadth, in metres, of the hatch opening. Where there are multiple openings abreast, these are regarded as a single opening, and b is to be the sum of the individual breadths of these openings

l_H = length of the hatch opening, in metres

l_{BH} = distance, in metres, between centres of the deck strip at each end of the hatch opening. Where there is no further opening beyond the one under consideration, the point to which l_{BH} is measured will be considered, see also Figure 4.3.1 Deck opening size

B_1 = extreme breadth of deck including hatch opening, measured at the mid-length of the opening, in metres.

Figure 4.3.1: Deck opening size

3.2 General

3.2.1 The requirements of this Chapter apply to sea-going steel ships, of normal form, proportions and speed, unless direct calculation procedures are adopted, in which case the assumptions made and the calculations performed are to be submitted for approval.

3.2.2 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. See Pt 1, Ch 2, 2.3 Class notations (hull).

3.3 Exceptions

3.3.1 Individual consideration based on direct calculation procedures will generally be required for ships having one or more of the following characteristics:

- Length L greater than 400 m.
- Speed V greater than that defined in Table 4.3.1 Ship speed criteria for the associated block coefficient.
- Unusual type or design.
- Unusual hull weight distribution.
- $\frac{L}{B} \leq 5$, or $\frac{B}{D} \geq 2,5$
- Large deck openings, or where warping stresses in excess of $14,7 \text{ N/mm}^2$ ($1,5 \text{ kgf/mm}^2$) are likely to occur.
- Openings for side loading in way of both sheerstrake and stringer.
- $C_b < 0,6$
- Carriage of heated cargo, see Pt 4, Ch 9, 12 Cargo temperatures.

Longitudinal Strength

Part 3, Chapter 4

Section 4

Table 4.3.1: Ship speed criteria

Ship length L , m	C_b	Speed, knots
≤ 200	$> 0,80$	17
	$= 0,70$	19,5
	$< 0,60$	22
> 200	$> 0,80$	18
	$= 0,70$	21,5
	$< 0,60$	25
NOTE Intermediate values of speed to be obtained by linear interpolation for C_b		

3.3.2 A ship is regarded as having large deck openings if both the following conditions apply to any one opening:

$$\frac{b}{B_1} > 0,6$$

$$\frac{l_H}{l_{BH}} > 0,7$$

See also Figure 4.3.1 Deck opening size.

Section 4 Information required

4.1 List of requirements

4.1.1 In order that an assessment of the longitudinal strength requirements can be made, the following information is to be submitted, in LR's standard format where appropriate.

- General arrangement and capacity plan or list, showing details of the volume and position of centre of gravity of all tanks and compartments.
- Bonjean data, in the form of tables or curves, for at least 21 equally spaced stations along the hull. A lines plan and/or tables of offsets may also be required.
- Details of the calculated lightweight and its distribution.
- Loading Manual.
- Details of the weights and centres of gravity of all deadweight items for each of the main loading conditions for individual ship types specified in Pt 4 Ship Structures (Ship Types). It is recommended that this information be submitted in the form of a preliminary Loading Manual, and that it includes the calculated still water bending moments and shear forces.

4.1.2 For final Loading Manual, see Pt 3, Ch 4, 8 Loading guidance information.

Section 5 Hull bending strength

5.1 Symbols

5.1.1 The symbols used in this Section are defined as follows:

f_1 = ship service factor

f_2 = wave bending moment factor

F_B = local scantling reduction factor for hull members below the neutral axis, see Pt 3, Ch 4, 5.7 Local reduction factors

F_D = local scantling reduction factor for hull members above the neutral axis, see Pt 3, Ch 4, 5.7 Local reduction factors

I_{\min} = minimum moment of inertia, of the hull midship section about the transverse neutral axis, in m^4

M_s = design still water bending moment, sagging (negative) and hogging (positive), in kN m (tonne-f m), to be taken negative or positive according to the convention given in Pt 3, Ch 4, 5.3 Design still water bending moments

\overline{M}_s = maximum permissible still water bending moment, sagging (negative) and hogging (positive), in kN m (tonne-f m), see Pt 3, Ch 4, 5.4 Minimum hull section modulus

M_w = design hull vertical wave bending moment amidships, sagging (negative) and hogging (positive), in kN m (tonne-f m), to be taken negative or positive according to the convention given in Pt 3, Ch 4, 5.3 Design still water bending moments

Z_c = actual hull section modulus, in m^3 , at continuous strength member above strength deck, calculated with the lever specified in Pt 3, Ch 3, 3.4 Calculation of hull section modulus

Z_D, Z_B = actual hull section moduli, in m^3 , at strength deck and keel respectively, see Pt 3, Ch 3, 3.4 Calculation of hull section modulus

Z_{\min} = minimum hull midship section modulus about the transverse neutral axis, in m^3

σ = permissible combined stress (still water plus wave), in N/mm^2 (kgf/mm^2), see Pt 3, Ch 4, 5.5 Permissible still water bending moments

σ_D, σ_B = maximum hull vertical bending stress at strength deck and keel respectively, in N/mm^2 (kgf/mm^2)

z = vertical distance from the hull transverse neutral axis to the position considered, in metres

z_M = vertical distance, in metres, from the hull transverse neutral axis to the minimum limit of higher tensile steel, as defined in Pt 3, Ch 3, 2.6 Vertical extent of higher tensile steel, above or below the neutral axis as appropriate.

5.2 Design vertical wave bending moments

5.2.1 The appropriate hogging or sagging design hull vertical wave bending moment at amidships is given by the following:

$$M_w = f_1 f_2 M_{wo}$$

where

C_b = is to be taken not less than 0,60

C_1 = is given in Table 4.5.1 Wave bending moment factor

C_2 = 1, (also defined in Pt 3, Ch 4, 5.2 Design vertical wave bending moments at other positions along the length L)

f_1 = ship service factor. To be specially considered depending upon the service restriction and in any event should be not less than 0,5. For unrestricted sea-going service $f_1 = 1,0$

f_2 = -1,1 for sagging (negative) moment

Longitudinal Strength

Part 3, Chapter 4

Section 5

where

$$f_2 = \frac{1,9C_b}{(C_b + 0,7)} \text{ for hogging (positive) moment}$$

$$\begin{aligned} M_{w0} &= 0,1C_1 C_2 L^2 B (C_b + 0,7) \text{ kN m} \\ &= (0,0102C_1 C_2 L^2 B (C_b + 0,7) \text{ tonne-f m}) \end{aligned}$$

Consideration will be given to direct calculations of long-term vertical wave bending moments, see Pt 3, Ch 4, 2.6 Approved calculation systems.

Table 4.5.1: Wave bending moment factor

Length L , in metres	Factor C_1
< 90	$0,0412L + 4,0$
90 to 300	$10,75 - \left(\frac{300 - L}{100}\right)1,5$
$> 300 \leq 350$	10,75
$> 350 \leq 500$	$10,75 - \left(\frac{L - 350}{150}\right)1,5$

5.2.2 The longitudinal distribution factor, C_2 , of wave bending moment is to be taken as follows:

- 0 at the aft end of L
- 1,0 between $0,4L$ and $0,65L$ from aft
- 0 at the forward end of L

Intermediate values are to be determined by linear interpolation.

5.2.3 For operation in sheltered water or short voyages, a higher permissible still water bending moment can be assigned based on a reduced vertical wave bending moment given by:

(a) For operating in sheltered water:

$$M_w = 0,5f_2 M_{w0}$$

(b) For short voyages:

$$M_w = 0,8f_2 M_{w0}$$

These expressions can only be used in the expression for permissible still water bending moment, see Pt 3, Ch 4, 5.4 Minimum hull section modulus, and the relevant loading conditions are to be included in the Loading Manual, see Pt 3, Ch 4, 8.1 General.

5.2.4 'Short voyages' are defined as voyages of limited duration in reasonable weather. 'Reasonable weather' and 'sheltered water' are defined in Pt 1, Ch 2, 2 Character of classification and class notations.

5.3 Design still water bending moments

5.3.1 The design still water bending moment, M_s , hogging and sagging is the maximum moment calculated from the loading conditions, given in Pt 3, Ch 4, 5.3 Design still water bending moments, and is to satisfy the following relationship:

$$|M_s| \leq |\overline{M}_s|$$

5.3.2 Still water bending moments are to be calculated along the ship length. For these calculations, downward loads are to be taken as positive values and are to be integrated in the forward direction from the aft end of L . Hogging bending moments are positive.

5.3.3 In general, the following loading conditions, based on amount of bunkers, fresh water and stores at departure and arrival, are to be considered.

Longitudinal Strength

Part 3, Chapter 4

Section 5

-
- (a) General cargo ships, container ships, passenger ships, roll on-roll off ships and refrigerated cargo carriers:
- (i) Homogeneous loading conditions, at maximum draught.
 - (ii) Ballast conditions.
 - (iii) Special loading conditions, e.g. container or light load conditions at less than the maximum draught, heavy cargo, empty holds or non-homogeneous cargo conditions, deck cargo conditions, etc. where applicable.
- (b) Bulk carriers (see Pt 3, Ch 4, 3.2 General), ore carriers and combination carriers
- (i) For ships of length, L , less than 150 m:

Alternate hold loading conditions at maximum draught, where applicable.

Homogeneous loading conditions at maximum draught.

Ballast conditions, including intermediate conditions associated with ballast exchange at sea.

Special conditions, e.g. deck cargo conditions.

For combination carriers, the conditions as specified in (c) for oil tankers are also to be considered.
 - (ii) For ships of length, L , 150 m or above:

Alternate light and heavy cargo loading conditions at maximum draught, where applicable.

Homogeneous light and heavy cargo loading conditions at maximum draught.

Ballast conditions. Where vessels are designed with a ballast hold adjacent to topside wing, hopper and double bottom tanks, the structure design is to be such that the ballast hold can be filled with all adjacent tanks empty;

Short voyage conditions where the ship is loaded to maximum draught with reduced bunkers, where applicable.

Multiple port loading/unloading conditions, where applicable.

Deck cargo conditions, where applicable.

Typical loading and discharging sequences from commencement to end of cargo operation, for homogeneous, alternate and part load conditions, where applicable.

Typical sequences for exchange of ballast at sea, where applicable.

For combination carriers, the conditions as specified in (c) for oil tankers are also to be considered.

For bulk carriers, the conditions as specified in Pt 3, Ch 4, 5.4 Minimum hull section modulus for the relevant notation are also to be considered.
- (c) Oil tankers (see Pt 3, Ch 4, 3.2 General):
- (i) Homogeneous loading conditions (excluding dry and clean ballast tanks) and ballast or part loaded conditions.
 - (ii) Any specified non-uniform distribution of loading.
 - (iii) Mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions.
- (d) Chemical tankers:
- (i) Conditions as specified for oil tankers.
 - (ii) Conditions for high density or segregated cargo.
- (e) Liquefied gas carriers:
- (i) Homogeneous loading conditions for all approved cargoes.
 - (ii) Ballast conditions.
 - (iii) Cargo conditions where one or more tanks are empty or partially filled or where more than one type of cargo having significantly different densities is carried.
- (f) All ships:
- (i) Any other loading condition likely to result in high bending moments and/or shear forces (including docking conditions, as appropriate).

5.3.4 Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also where any ballasting and/or de-ballasting is intended during voyage, calculations of the intermediate condition just before and just

after ballasting and/or de-ballasting any tank are to be submitted and, where approved, included in the loading manual for guidance.

5.3.5 Ballast loading conditions involving partially filled peak and/or other ballast tanks at departure, arrival or during intermediate conditions are not permitted as design conditions unless the design stress limits are satisfied for all filling levels between empty and full, and for bulk carriers the requirements of Pt 4, Ch 7, 3 Longitudinal strength, as applicable, are to be complied with for all filling levels between empty and full. To demonstrate compliance with all filling levels between empty and full, it will be acceptable if, in each condition at departure, arrival and where required by Pt 3, Ch 4, 5.3 Design still water bending moments, any intermediate condition, the tanks intended to be partially filled are assumed to be:

- empty
- full
- partially filled at intended level.

Where multiple tanks are intended to be partially filled, all combinations of empty, full or partially filled at intended level for those tanks are to be investigated. However, for conventional ore carriers with large wing water ballast tanks in cargo area, where empty or full ballast water filling levels of one or maximum two pairs of these tanks lead to the ship's trim exceeding one of the following conditions, it is sufficient to demonstrate compliance with maximum, minimum and intended partial filling levels of these one or maximum two pairs of ballast tanks such that the ship's condition does not exceed any of these trim limits. Filling levels of all other wing ballast tanks are to be considered between empty and full. The trim conditions mentioned above are:

- trim by stern of 3 per cent of the ship's length, or
- trim by bow of 1.5 per cent of ship's length, or
- any trim that cannot maintain propeller immersion (I/D) not less than 25 per cent, where;

I = the distance from propeller centreline to the waterline, see Figure 4.5.1 Propeller immersion

D = propeller diameter, see Figure 4.5.1 Propeller immersion

The maximum and minimum filling levels of the above mentioned pairs of side ballast tanks are to be indicated in the loading manual.

5.3.6 When considering cargo loading conditions, the requirements of Pt 3, Ch 4, 5.3 Design still water bending moments apply to peak tanks only.

Figure 4.5.1: Propeller immersion

5.3.7 When considering ballast water exchange using the sequential method, the requirements of Pt 3, Ch 4, 5.3 Design still water bending moments and Pt 3, Ch 4, 5.3 Design still water bending moments do not apply. However, bending moment and shear force calculations for each de-ballasting or ballasting stage in the ballast water exchange sequence are to be included in the loading manual or ballast water management plan of any vessel that intends to employ the sequential ballast water exchange method.

5.4 Minimum hull section modulus

5.4.1 The hull midship section modulus about the transverse neutral axis, at the deck or the keel, is to be not less than:

$$Z_{\min} = f_1 k_L C_1 L^2 B (C_b + 0,7) \times 10^{-6} \text{ m}^3$$

= and f_1 is to be taken not less than 0,5.

5.4.2 For materials to be included in the calculation of actual hull section properties, see Pt 3, Ch 3, 3 Structural idealisation.

5.4.3 The midship section modulus for ships with a service restriction notation is to be not less than half the minimum value required for unrestricted service.

5.4.4 Scantlings of all continuous longitudinal members of the hull girder based on the minimum section modulus requirements given in Pt 3, Ch 4, 5.4 Minimum hull section modulus are to be maintained within 0,4L amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the 0,4L part, bearing in mind the desire not to inhibit the vessel's loading flexibility.

5.4.5 Outside 0,4L amidships, as a minimum, hull girder bending strength checks are to be carried out at the following locations:

- (a) In way of the forward end of the engine room.
- (b) In way of the forward end of the foremost cargo hold.
- (c) At any locations where there are significant changes in hull cross-section.
- (d) At any locations where there are changes in the framing system.

5.5 Permissible still water bending moments

5.5.1 The permissible still water bending moments sagging and hogging are to be taken as the lesser of the following:

- (a) $|\overline{M}_s| = F_D \sigma Z_D \times 10^3 - |M_w| \text{ kN m (tonne-f m)}$
- (b) $|\overline{M}_s| = F_B \sigma Z_B \times 10^3 - |M_w| \text{ kN m (tonne-f m)}$

where

σ = the permissible combined stress in N/mm² (kgf/mm²) is given in Pt 3, Ch 4, 5.6 Permissible hull vertical bending stresses and F_D and F_B are defined in Pt 3, Ch 4, 5.7 Local reduction factors. M_w is the design wave bending moment, sagging or hogging as appropriate, in accordance with Pt 3, Ch 4, 5.2 Design vertical wave bending moments.

5.6 Permissible hull vertical bending stresses

5.6.1 The permissible combined (still water plus wave) stress for hull vertical bending, σ , is given by:

(a) Within 0,4L amidships

$$\sigma = \frac{175}{k_L} \text{ N/mm}^2 \left(\frac{17,84}{k_L} \text{ kgf/mm}^2 \right)$$

(b) for continuous longitudinal structural members outside 0,4L amidships

$$\sigma = \left(75 + 543 \frac{d}{L} - 699 \left(\frac{d}{L} \right)^2 \right) \frac{1}{k_L} \text{ N/mm}^2$$

$$\left(\sigma = \left(75 + 543 \frac{d}{L} - 699 \left(\frac{d}{L} \right)^2 \right) \frac{0,102}{k_L} \text{ kgf/mm}^2 \right)$$

where d is the distance, in metres, from the F.P. (for the fore end region) or from the A.P. (for the aft end region), as appropriate, to the location under consideration.

Special consideration will be given to increasing the permissible stress outside $0,4L$ amidships to

$$\frac{175}{k_L} \text{ N/mm}^2 \left(\frac{17,84}{k_L} \text{ kgf/mm}^2 \right)$$

provided that sufficient buckling checks are carried out.

5.6.2 The requirements for ships of special or unusual design and for the carriage of special cargoes will be individually considered.

5.7 Local reduction factors

5.7.1 The maximum hull vertical bending stresses at deck, σ_D , and keel, σ_B , are given by the following, using the appropriate combination of bending moments to give sagging and hogging stresses:

$$\sigma_D = \frac{|\overline{M}_s + M_w|}{Z_D} \times 10^{-3} \text{ N/mm}^2 (\text{kgf/mm}^2)$$

$$\sigma_B = \frac{|\overline{M}_s + M_w|}{Z_B} \times 10^{-3} \text{ N/mm}^2 (\text{kgf/mm}^2)$$

Where the ship is always in the hogging condition, the sagging bending moment is to be specially considered.

5.7.2 Where the maximum hull vertical bending stress at deck or keel is less than the permissible combined stress, σ , reductions in local scantlings within $0,4L$ amidships may be permitted. The reduction factors applicable in Pt 4 Ship Structures (Ship Types) are defined as follows:

(a) For hull members above the neutral axis

$$F_D = \frac{\sigma_D}{\sigma}$$

(b) For hull members below the neutral axis

$$F_B = \frac{\sigma_B}{\sigma}$$

In general, the values of σ_D and σ_B to be used are the greater of the sagging or hogging stresses, and F_D and F_B are not to be taken less than 0,67 for plating and 0,75 for longitudinal stiffeners.

5.7.3 Where higher tensile steel is used in the hull structure, the values of F_D and F_B for the mild steel part are to be taken as not less than $\frac{Z}{Z_M}$.

5.8 Hull moment of inertia

5.8.1 The hull midship section moment of inertia about the transverse neutral axis is to be not less than the following using the maximum total bending moment, sagging or hogging:

$$I_{\min} = \frac{3L(|\overline{M}_s + M_w|)}{k_L \sigma} \times 10^{-5} \text{ m}^4$$

where values of σ are given in Pt 3, Ch 4, 5.6 Permissible hull vertical bending stresses.

In addition for vessels with $L \geq 90$ m the hull midship section moment of inertia is not to be less than the following:

$$I_{\min} = 3C_1 L^3 B(C_B + 0,7) \times 10^{-8} \text{ m}^4$$

where C_1 is given in Pt 3, Ch 4, 5.2 Design vertical wave bending moments.

5.9 Continuous strength members above strength deck

5.9.1 Where trunk decks or continuous hatch coamings are effectively supported or deck longitudinals or girders are fitted above the strength deck, the modulus Z_c is to be not less than Z_{\min} . The scantling reduction factor, F_D , referred to strength deck

at side, is applicable and, in addition to the requirement given in Pt 3, Ch 4, 5.5 Permissible still water bending moments, the permissible still water bending moments, sagging and hogging, are not to exceed:

$$|\overline{M}_s| = \alpha Z_c \times 10^3 - |M_w| \text{ kN m (tonne-f m)}$$

where

M_w = is the design wave bending moment sagging or hogging, as appropriate, in accordance with Pt 3, Ch 4, 5.2 Design vertical wave bending moments.

■ Section 6 Hull shear strength

6.1 Symbols

6.1.1 The symbols used in this Section are defined as follows:

I = the inertia of the hull about the horizontal neutral axis at the section concerned, in cm^4

Az = the first moment, in cm^3 , about the neutral axis, of the area of the effective longitudinal members between the vertical level under consideration, and the vertical extremity of the effective longitudinal members, taken at the section under consideration

Q_s = design hull still water shear force, in kN (tonne-f), to be taken as negative or positive according to the convention given in Pt 3, Ch 4, 6.4 Design still water shear force

\overline{Q}_s = permissible hull still water shear force, in kN (tonne-f), see Pt 3, Ch 4, 6.5 Permissible still water shear force

Q_w = design hull wave shear force, in kN (tonne-f), to be taken as negative or positive according to the convention given in Pt 3, Ch 4, 6.4 Design still water shear force

τ = permissible combined shear stress (still water plus wave), in N/mm^2 (kgf/mm^2), see Pt 3, Ch 4, 6.6 Permissible shear stress

τ_A = design shear stress, in N/mm^2 (kgf/mm^2), as given in Pt 3, Ch 4, 6.7 Design shear stress for use in Pt 3, Ch 4, 7.4 Design stress.

6.2 General

6.2.1 For ships with length L greater than 65 m, the shear forces on the hull structure are to be investigated.

6.2.2 For L greater than 200 m, where double skin construction of the side shell in association with topside and hopper tanks is proposed, shear flow calculations may be required to be submitted.

6.2.3 Where shear flow calculation procedures, other than those available within ShipRight are employed, the requirements of Pt 3, Ch 1, 3 Equivalents are to be complied with.

6.2.4 For passenger ships, the assessment of permissible still water shear forces is to take into consideration the effectiveness of the continuous superstructures and the sizes and arrangements of window and door openings.

6.2.5 Where longitudinal bulkheads are perforated by cut-outs, the assessment of permissible still water shear forces is to take into consideration the loss of material.

6.3 Design wave shear force

6.3.1 The design hull wave shear force, Q_w , at any position along the ship is given by:

$$Q_w = K_1 K_2 Q_{w0} \text{ kN (tonne - f)}$$

where

$$Q_{w0} = 0,3C_1 LB (C_B + 0,7) \text{ kN}$$

$$(0,0306C_1 LB (C_B + 0,7) \text{ tonne-f})$$

and C_B is to be taken not less than 0,6

K_1 is to be taken as follows, see also Figure 4.6.1 Shear force factor K_1 :

(a) Positive shear force

$$\begin{aligned} K_1 &= 0 \text{ at aft end of } L \\ &= \frac{1,589C_b}{(C_b + 0,7)} \text{ between } 0,2L \text{ and } 0,3L \text{ from aft} \\ &= 0,7 \text{ between } 0,4L \text{ and } 0,6L \text{ from aft} \\ &= 1,0 \text{ between } 0,7L \text{ and } 0,85L \text{ from aft} \\ &= 0 \text{ at forward end of } L \end{aligned}$$

(b) Negative shear force

$$\begin{aligned} K_1 &= 0 \text{ at aft end of } L \\ &= -0,92 \text{ between } 0,2L \text{ and } 0,3L \text{ from aft} \\ &= -0,7 \text{ between } 0,4L \text{ and } 0,6L \text{ from aft} \\ &= \frac{-1,727C_B}{(C_B + 0,7)} \text{ between } 0,7L \text{ and } 0,85L \text{ from aft} \\ &= 0 \text{ at forward end of } L \\ &= \text{Intermediate values to be determined by linear interpolation} \end{aligned}$$

$$\begin{aligned} K_2 &= 1,0 \text{ for unrestricted sea-going service conditions} \\ &= 0,8 \text{ for short voyages} \\ &= 0,5 \text{ for operating in sheltered water.} \end{aligned}$$

Figure 4.6.1: Shear force factor K_1

6.4 Design still water shear force

6.4.1 The design still water shear force, Q_s , at each transverse section along the hull is to be taken as the maximum positive and negative value found from the longitudinal strength calculations for each of the loading conditions given in Pt 3, Ch 4, 5.3 Design still water bending moments and is to satisfy the following relationship:

$$|q_s| \leq |\bar{q}_s|$$

6.4.2 Still water shear forces are to be calculated at each section along the ship length. For these calculations, downward loads are to be taken as positive values and are to be integrated in a forward direction from the aft end of L . The shear force is positive when the algebraic sum of all vertical forces aft of the section is positive.

6.4.3 For hull configuration Types A, D, G, H and I, as indicated in Table 4.6.1 factors where loading conditions are featuring either:

- cargo loading with specified or alternative cargo holds (or cargo tanks) empty; or
- ballasting of cargo hold(s);

the actual shear forces obtained from the longitudinal strength calculations may be corrected for the effect of local forces at the transverse bulkheads. The calculation of these local forces is to be submitted for approval or, alternatively, the proportion of the double bottom load carried by the transverse bulkhead may be arrived at by using the following bulkhead factor F :

$$F = \frac{1}{1 + 1,5 \alpha^{1,65}}$$

where

l_F = span of floors measured to intersection of hopper side or ship's side, and inner bottom, in metres

S_H = length of hold measured between bulkhead stools, where fitted, at the level of the inner bottom on the centreline, in metres

$$\alpha = \frac{S_H}{l_F}$$

Longitudinal Strength

<p>Symbols</p> <p>i = structural member index for different hull configurations for types A, B, C, D, E, F and G, i may take the value of 1, 2 or 3.</p> <p>for $i = 1$, the side shell at the section is under consideration</p> <p>for $i = 2$ and 3, the longitudinal bulkheads at the section are under consideration</p> <p>for types H and I, i may take the value of 1, 2, 3, 4, 5, 6, 7 or 8</p> <p>for $i = 1$, the part of side shell in way of topside tank is under consideration</p> <p>for $i = 2$, the topside slope is under consideration</p> <p>for $i = 3$, the part of side shell between topside tank and hopper tank is under consideration</p> <p>for $i = 4$, the inner hull is under consideration</p> <p>for $i = 5$, the part of side shell in way of hopper tank is under consideration</p> <p>for $i = 6$, the hopper slope is under consideration</p> <p>for $i = 7$, the vertical strake at topside tank is under consideration</p> <p>for $i = 8$, the double bottom girder at hopper tank is under consideration</p> <p>for types J, K and L, i may take the value of 1 or 2:</p>	

for $i = 1$, the side shell at the section is under consideration

for $i = 2$, the longitudinal bulkheads at the section are under consideration

A_i = the area of structural member i at the section under consideration in cm^2

In the event of part of the structural member being non-vertical, A_i is to be calculated using the projected area in the vertical direction, see Figure 4.6.4 Calculation of A_i for non-vertical parts of structural members, except for members 2 and 6 for types H and I, where the inclined area is to be applied.

Note 1. For hull configurations not included above, f_i factors are to be specially considered.

Note 2. Where it is necessary to increase the thickness of the side shell or longitudinal bulkhead(s) to meet these requirements, the original thicknesses are to be used in the calculation of the cross-sectional areas of A_i .

6.4.4 If the hull shear forces in kN (tonne-f) at transverse bulkheads A and B are calculated to be Q_A and Q_B respectively (with appropriate algebraic signs), the excess load or buoyancy over hold AB is given by $Q_B - Q_A$ and the load transmitted to each bulkhead is:

(a) $0,5F(Q_B - Q_A)$ kN (tonne-f)

where F is the bulkhead factor as given in Pt 3, Ch 4, 6.4 Design still water shear force.

See Figure 4.6.2 Shear force correction.

Figure 4.6.2: Shear force correction

6.4.5 The corrected shear forces, Q'_A and Q'_B , at bulkheads A and B with respect to hold AB are then obtained from:

$$Q'_A = Q_A + 0,5F(Q_B - Q_A) \text{ kN (tonne-f)}$$

$$Q'_B = Q_B - 0,5F(Q_B - Q_A) \text{ kN (tonne-f)}$$

6.5 Permissible still water shear force

6.5.1 The permissible hull still water shear force is given by the minimum value obtained from:

$$|Q_s| = \tau \frac{I \delta_i}{100 A_{z[d1]}} - |Q_w| \text{ kN(tonne - f)}$$

when

$$\delta_i = \frac{t_i}{f_i + m_i}$$

i = structural member index for the hull configuration under consideration, see Table 4.6.1 f_i factors .

t_i = the plate thickness of the structural member at the vertical level and section under consideration, in mm

f_i, m_i = factors determined from Table 4.6.1 f_i factors and Table 4.6.2 m_i factors respectively, for the hull configuration under consideration.

6.5.2 The permissible shear forces assigned for approved loading instruments will normally be based on Pt 3, Ch 4, 6.5 Permissible still water shear force. However, where use is made of an approved loading instrument incorporating a facility to calculate the transverse distribution of shear forces, separate permissible still water shear forces, Q_{si} may be assigned for the structural members indicated in Table 4.6.1 f_i factors for the hull configuration under consideration.

$$|Q_{si}| = (f_i + m_i) |Q_s| \text{ kN (tonne-f)}$$

6.5.3 Individual loading conditions in the ship's loading manual may be specially considered on a similar basis to that in Pt 3, Ch 4, 6.5 Permissible still water shear force with the factors being determined by direct calculation.

6.5.4 For hull configuration types B and E (see Table 4.6.1 f_i factors), where loading conditions are such that hull girder torsion may be induced, direct calculations may be required.

6.5.5 The calculation of shear forces immediately beyond the ends of the longitudinal bulkheads will be considered in relation to the arrangement of structure in these regions.

6.6 Permissible shear stress

6.6.1 The permissible combined shear stress (still water plus wave) is to be taken as:

$$\tau = \frac{110}{k_L} \text{ N/mm}^2 \left(\frac{11,2}{k_L} \text{ kgf/mm}^2 \right)$$

6.6.2 Where a plate is tapered, the permissible combined shear stress is not to be exceeded at any point in way of the taper, see Figure 4.6.3 Tapered plates.

Figure 4.6.3: Tapered plates

Table 4.6.2: m_i factors

Hull configuration, see Table 4.6.1	m_i factors
Type A	$m_1 = 0$
Type B	$m_1 = \frac{m_2}{2}, m_2 = (0, 1 + r)0,5$
Type C	$m_1 = m_2, m_2 = (0, 1 + r)\frac{b_2}{B}$
Type D	$m_1 = 0$
Type E	$m_1 = \frac{m_3}{4}, m_2 = \frac{m_3}{4}, m_3 = (0, 1 + r)0,5\left(1 - \frac{b_2}{B}\right)$
Type F	$m_1 = \frac{m_3}{2}, m_2 = \frac{m_3}{2}, m_3 = (0, 1 + r)\left(\frac{b_3 - 0,5b_2}{B}\right)$
Type G	$m_1 = 0$
Type H	$m_1 = 0$
Type I	$m_1 = 0$
Type J	$m_1 = 0$
Type K	$m_1 = 0$
Type L	$m_1 = 0$

<p>NOTE</p> <p>For hull configurations not included above, m_i factors are to be specially considered.</p>	

6.7 Design shear stress

6.7.1 The design shear stress for use in Pt 3, Ch 4, 7.4 Design stress is to be taken as:

$$\tau_A = 100Az \frac{|Q_s| + |Q_w|}{I \delta_i} \quad \text{N/mm}^2$$

$$\left(10,2Az \frac{|Q_s| + |Q_w|}{I \delta_i} \quad \text{kgf/mm}^2 \right)$$

**Figure 4.6.4: Calculation of A_i for non-vertical parts of structural members**

■ Section 7 Hull buckling strength

7.1 Application

7.1.1 These requirements apply to plate panels and longitudinals subjected to hull girder compression and shear stresses based on design values for still water and wave bending moments and shear forces.

7.1.2 The hull buckling strength requirements are applicable within $0,4L$ amidships to ships of 90 m or greater in length.

7.1.3 Hull buckling strength for ships less than 90 m in length will be specially considered.

7.1.4 Hull buckling strength outside $0,4L$ amidships of members contributing to the longitudinal strength and subjected to compressive and shear stresses is to be checked, in particular in regions where changes in the framing system or significant changes in the hull cross-section occur.

7.2 Symbols

7.2.1 The symbols used in this Section are defined as follows:

d_t = standard deduction for corrosion, see Table 4.7.1 Standard deduction for corrosion, d_t

s = spacing of secondary stiffeners, in mm. In the case of symmetrical corrugations, s is to be taken as b or c in Figure 3.3.1 Corrugation dimensions in Ch 3, whichever is the greater

t = as built thickness of plating, stiffener flange and web used in Table 4.7.1 Standard deduction for corrosion, d_t in calculating standard deduction d_t , in mm

t_p = as built thickness of plating less standard deduction d_t , in mm, (i.e. $t_p = t - d_t$)

E = modulus of elasticity, in N/mm² (kgf/mm²)

= 206000 N/mm² (21000 kgf/mm²) for steel

S = spacing of primary members, in metres

σ_o = specified minimum yield stress, in N/mm² (kgf/mm²)

σ_A = design longitudinal compressive stress in N/mm² (kgf/mm²)

σ_{CRB} = critical buckling stress in compression, in N/mm² (kgf/mm²) corrected for yielding effects

σ_E = elastic critical buckling stress in compression, in N/mm² (kgf/mm²)

τ_A = design shear stress in N/mm² (kgf/mm²)

τ_{CRB} = critical buckling stress in shear, N/mm² (kgf/mm²) corrected for yielding effects

τ_E = elastic critical buckling stress in shear, in N/mm² (kgf/mm²)

$$\tau_o = \frac{\sigma_o}{\sqrt{3}}$$

7.3 Elastic critical buckling stress

7.3.1 The elastic critical buckling stress of plating is to be determined from Table 4.7.2 Elastic critical buckling strength of plating.

7.3.2 The elastic critical buckling stress of longitudinals is to be determined from Table 4.7.3 Elastic critical buckling strength of longitudinals

7.4 Design stress

7.4.1 Design longitudinal compressive stress, σ_A , is to be determined in accordance with Pt 3, Ch 4, 5 Hull bending strength :

$$\text{minimum } \sigma_A = \frac{30}{k_L} \text{ N/mm}^2 \left(\frac{3,06}{k_L} \text{ kgf/mm}^2 \right)$$

for structural members above the neutral axis,

$$\sigma_A = \sigma_D \frac{z}{z_D}$$

for structural members below the neutral axis,

$$\sigma_A = \sigma_B \frac{z}{z_B}$$

σ_D based on sagging moment and σ_B based on hogging moment are determined in Pt 3, Ch 4, 5.8 Hull moment of inertia.

Longitudinal Strength

Part 3, Chapter 4

Section 7

where

z = vertical distance from the hull transverse neutral axis to the position considered, excluding deck camber, in metres

z_D, z_B = vertical distances from the hull transverse neutral axis to the deck and keel respectively, in metres

For initial design purposes, the hull transverse neutral axis may be taken at a distance $\frac{D}{2}$ above keel, where D is the depth of the ship, in metres, as defined in Pt 3, Ch 1, 6 Definitions.

Table 4.7.1: Standard deduction for corrosion, d_t

Structure		d_t mm	d_t range mm min. - max.
(a) Compartments carrying dry bulk cargoes	–	0,05t	0,5 - 1
(b) One side exposure to water ballast and/or liquid cargo.	Vertical surfaces and surfaces sloped at an angle greater than 25° to the horizontal line.		
(c) One side exposure to water ballast and/or liquid cargo.	Horizontal surfaces and surfaces sloped at an angle less than 25° to the horizontal line.	0,10t	2 - 3
(d) Two side exposure to water ballast and/or liquid cargo.	Vertical surfaces and surfaces sloped at an angle greater than 25° to the horizontal line.		
(e) Two side exposure to water ballast and/or liquid cargo.	Horizontal surfaces and surfaces sloped at an angle less than 25° to the horizontal line.	0,15t	2 - 4
Note 1. The standard deduction d_t is to be taken as appropriate and within the range given above.			
Note 2. For direct calculation purposes, standard deductions will be specially considered.			

Table 4.7.2: Elastic critical buckling strength of plating

Mode	Elastic critical buckling stress, N/mm ² (kgf/mm ²)
(a) Compression of plating with longitudinal stiffeners (parallel to compressive stress), see Note	$\sigma_E = 3,6E \left(\frac{t_p}{s} \right)^2$
(b) Compression of plating with transverse stiffeners (perpendicular to compressive stress), see Note	$\sigma_E = 0,9 \left[1 + \left(\frac{s}{1000S} \right)^2 \right]^2 E \left(\frac{t_p}{s} \right)^2$ where $c = 1,3$ when plating stiffened by floors or deep girders $= 1,21$ when stiffeners are built up profiles or rolled angles $= 1,10$ when stiffeners are bulb plates $= 1,05$ when stiffeners are flat bars
(c) Shear, see Note	$\tau_E = 3,6 \left[1,335 + \left(\frac{s}{1000S} \right)^2 \right] E \left(\frac{t_p}{s} \right)^2$
Note Where the elastic critical buckling stress, as evaluated from (a), (b) or (c), exceeds 50 per cent of specified minimum yield stress of the material, the corrected critical buckling stresses in compression (σ_{CRB}) and shear (τ_{CRB}) are given by:	
$\sigma_{CRB} = \sigma_E \quad \text{when } \sigma_E \leq \frac{\sigma_o}{2}$ $= \sigma_o \left(1 - \frac{\sigma_o}{4\sigma_E} \right) \quad \text{when } \sigma_E > \frac{\sigma_o}{2}$ $\tau_{CRB} = \tau_E \quad \text{when } \tau_E \leq \frac{\tau_o}{2}$ $= \tau_o \left(1 - \frac{\tau_o}{4\tau_E} \right) \quad \text{when } \tau_E > \frac{\tau_o}{2}$	
	N/mm ² (kgf/mm ²)
	N/mm ² (kgf/mm ²)

7.4.2 Design shear stress, τ_A , is to be determined in accordance with Pt 3, Ch 4, 6 Hull shear strength.

For initial design purposes, τ_A may be taken as:

$$\tau_A = \frac{110}{k_L} \text{ N/mm}^2 \left(\frac{11,2}{k_L} \text{ kgf/mm}^2 \right)$$

7.5 Scantling criteria

7.5.1 The corrected critical buckling stress in compression, σ_{CRB} , of plate panels and longitudinals, as derived from Table 4.7.2 Elastic critical buckling strength of plating and Table 4.7.3 Elastic critical buckling strength of longitudinals, is to satisfy the following:

$$\sigma_{CRB} \geq \beta \sigma_A$$

where

$\beta = 1$ for plating and for web plating of longitudinals (local buckling)

$\beta = 1,1$ for longitudinals

7.5.2 The corrected critical buckling stress in shear, τ_{CRB} , of plate panels, as derived from Table 4.7.2 Elastic critical buckling strength of plating, is to satisfy the following:

$$\tau_{CRB} \geq \tau_A$$

Figure 4.7.1: Dimensions of longitudinals

Table 4.7.3: Elastic critical buckling strength of longitudinals

Mode	Elastic critical buckling stress, N/mm ² (kgf/mm ²)
(a) Column buckling (perpendicular to plane of plating) without rotation of cross section, see Note 1	$\sigma_E = 0,001E \frac{I_a}{A_t S^2}$
(b) Torsional buckling, see Note 1	$\sigma_E = \frac{0,001EI_w}{I_p S^2} \left(m^2 + \frac{K}{m^2} \right) + 0,385E \frac{I_t}{I_p}$
(c) Web buckling, see Notes 1 and 3 (flat bars are excluded)	$\sigma_E = 3,8E \left(\frac{t_w}{d_w} \right)^2$
Symbols and Parameters	
d_w = web depth, in mm	

Longitudinal Strength

Part 3, Chapter 4

Section 7

t_w = as built web thickness less standard deduction d_t as specified in Table 4.7.1 Standard deduction for corrosion, d_t , in mm, (i.e. $t_w = t - d_t$). For webs in which the thickness varies, a mean thickness is to be used

b_f = flange width, in mm

t_f = as built flange thickness less standard deduction d_t as specified in Table 4.7.1 Standard deduction for corrosion, d_t , in mm, (i.e. $t_f = t - d_t$). For bulb plates, the mean thickness of the bulb may be used, see Figure 4.7.1 Dimensions of longitudinals

A_t = cross-sectional area, in cm^2 , of longitudinal, including attached plating, taking account of standard deductions, see Note 4

I_a = moment of inertia, in cm^4 , of longitudinal, including attached plating, taking account of standard deductions, see Note 4

I_t = St.Venant's moment of inertia, in cm^4 , of longitudinal (without attached plating)

$$= \frac{d_w t_w^3}{3} 10^{-4} \text{ for flat bars}$$

$$= \frac{1}{3} \left[d_w t_w^3 + b_f t_f^3 \left(1 - 0,63 \frac{t_f}{b_f} \right) \right] 10^{-4} \text{ for built up profiles, rolled angles and bulb plates}$$

I_p = polar moment of inertia, in cm^4 , of profile about connection of stiffener to plating

$$= \frac{d_w^3 t_w}{3} 10^{-4} \text{ for flat bars}$$

$$= \left(\frac{d_w^3 t_w}{3} + d_w^2 b_f t_f \right) 10^{-4} \text{ for built up profiles, rolled angles and bulb plates}$$

I_w = sectorial moment of inertia, in cm^6 , of profile about connection of stiffener to plating

$$= \frac{d_w^3 t_w^3}{36} 10^{-6} \text{ for flat bars}$$

$$= \frac{t_f b_f^3 d_w^2}{12} 10^{-6} \text{ for 'Tee' profiles}$$

$$= \frac{b_f^3 d_w^2}{12(b_f + d_w)^2} \left[t_f (b_f^2 + 2b_f d_w + 4d_w^2) + 3t_w b_f d_w \right] 10^{-6} \text{ for 'L' profiles, rolled angles and bulb plates}$$

$$K = \frac{1,03CS^4}{EI_w} 10^4$$

m is determined as follows:

m	K range
1	$0 < K \leq 4$
2	$4 < K \leq 36$
3	$36 < K \leq 144$

Longitudinal Strength

Part 3, Chapter 4

Section 8

4	$144 < K \leq 400$
5	$400 < K \leq 900$
6	$900 < K \leq 1764$
m	$(m - 1)^2 m^2 < K \leq m^2 (m + 1)^2$
<p>C = spring stiffness exerted by supporting plate panel</p> <p>$k_p = 1 - \eta_p$, and is not to be taken less than zero. For built up profiles, rolled angles and bulb plates, k_p need not be taken less than 0,1</p> <p>$n_p = \frac{\sigma_A}{\sigma_{EP}}$ where σ_{EP} = elastic critical buckling stress (σ_E) of supporting plate derived from Table 4.7.2 Elastic critical buckling strength of plating</p> <p>All other symbols as defined in Pt 3, Ch 4, 7.2 Symbols .</p> <p>Note 1. Where the elastic critical buckling stress, as evaluated from (a), (b) or (c), exceeds 50 per cent of specified minimum yield stress of the material, the corrected critical buckling stress in compression (σ_{CRB}) is given by: $\sigma_{CRB} = \sigma_o \left(1 - \frac{\sigma_o}{4 \sigma_E} \right) \text{N/mm}^2 (\text{kgf/mm}^2)$</p> <p>Note 2. Figure 4.7.1 Dimensions of longitudinals shows the dimensions of longitudinals.</p> <p>Note 3. For flanges on angles and T-sections of longitudinals, the following requirement is to be satisfied:</p> <p>$\frac{b_f}{t} \leq 15$ for angles, $\frac{b_f}{t} \leq 30$ for 'Tee' profiles,</p> <p>where</p> <p>t = as built flange thicknesses, in mm</p> <p>Note 4. The area of attached plating is to be calculated using actual spacing of secondary stiffeners.</p>	

Section 8

Loading guidance information

8.1 General

8.1.1 Sufficient information is to be supplied to the Master of every ship to enable him to arrange loading and ballasting in such a way as to avoid the creation of unacceptable stresses in the ship's structure.

8.1.2 This information is to be provided by means of a Loading Manual and in addition, where required, by means of an approved loading instrument.

8.2 Loading Manual

8.2.1 A Loading Manual is to be supplied to all ships where longitudinal strength calculations have been required, see Pt 3, Ch 4, 2 General. The Manual is to be submitted for approval in respect of strength aspects. Where both Loading Manual and loading instrument are supplied, the Loading Manual must nevertheless be approved from the strength aspect. In this case, the Manual is to be endorsed to the effect that any departures from these conditions in service are to be arranged on the basis of the loading instrument and the allowable local loadings shown in the Manual, see Pt 3, Ch 4, 8.2 Loading Manual.

8.2.2 The Manual is to be based on the final data of the ship and is to include well-defined lightweight distribution and buoyancy data.

8.2.3 Details of the loading conditions given in Pt 3, Ch 4, 5.3 Design still water bending moments are to be included in the Manual as applicable.

8.2.4 The Manual is also to contain the following:

- (a) Values of actual and permissible still water bending moments and shear forces and, where applicable, limitations due to torsional loads.
- (b) The allowable local loadings for the structure such as the hatch covers, decks and double bottoms. If the ship is not approved to carry load on the deck or hatch covers, this is to be clearly stated.
- (c) Details of cargo carriage constraints imposed by the use of an accepted coating in association with a system of corrosion control, see Pt 3, Ch 2, 3.6 Application of coatings and alternative means of protection.
- (d) A note saying:

'Scantlings approved for minimum draught forward of ...m with ballast tanks No... filled. In heavy weather conditions the forward draught should not be less than this value. If, in the opinion of the Master, sea conditions are likely to cause regular slamming, then other appropriate measures such as change in speed, heading or an increase in draught forward may also need to be taken.'

- (e) The maximum unladen weight, in tonnes, of grab that is considered suitable for the approved thickness of the hold inner bottom for bulk carriers and ore or oil carriers that are regularly discharged by grabs. This maximum unladen weight may differ for adjacent holds, see Pt 3, Ch 9, 8.2 Inner bottom plating and Pt 4, Ch 7, 8.1 General. This weight does not preclude the use of heavier grabs, but is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.

8.2.5 In addition to the requirements of Pt 3, Ch 4, 8.2 Loading Manual, the Manual is to contain the following information for bulk carriers (see Pt 3, Ch 4, 3.2 General), ore carriers and combination carriers of length, L , 150 m or above:

- (a) The cargo hold(s) or combination of cargo holds that may be empty at maximum draught. If no cargo hold is permitted to be empty at maximum draught, this is to be clearly stated in the Manual.
- (b) Maximum allowable and minimum required mass of cargo and double bottom ballast for each hold as a function of the draught at mid-hold position.
- (c) Maximum allowable and minimum required mass of cargo and double bottom ballast for any two adjacent holds as a function of the mean draught in way of these holds. The mean draught may be calculated by averaging the draught at the two mid-hold positions.
- (d) Maximum allowable inner bottom loading together with specification of the nature of the cargo, for cargoes other than bulk cargoes.
- (e) The maximum rate of ballast exchange, together with advice that a load plan is to be agreed with the terminal on the basis of achievable rates of exchange.

For bulk carriers for which it is required to undertake longitudinal strength calculations in the flooded condition, see Pt 4, Ch 7, 3.1 General, the Manual is also to contain envelope results and permissible limits of still water bending moments and shear forces for hold flooded conditions, see Pt 4, Ch 7, 3.4 Flooded conditions.

8.2.6 Where applicable, the Manual is also to contain the procedure for ballast exchange and sediment removal at sea.

8.2.7 Where alteration to structure, lightweight, cargo distribution or draught is proposed, revised information is to be submitted for approval.

8.3 Loading instrument

8.3.1 In addition to a Loading Manual, an approved type loading instrument is to be provided for all ships where L is greater than 65 m and which are approved for non-uniform distribution of loading. The following ships are exempt from this requirement:

- (a) Ships with very limited possibilities for variations in the distribution of cargo and ballast.
- (b) Ships with a regular or fixed trading pattern.
- (c) Ships exempt by individual Chapters in Pt 4 Ship Structures (Ship Types).

8.3.2 The loading instrument is to be capable of calculating shear forces and bending moments, in any load or ballast condition at specified readout points and is to indicate the permissible values. On container ships and other ships with large deck openings, (see Pt 3, Ch 4, 3.3 Exceptions) cargo torque is also to be calculated.

8.3.3 For bulk carriers, ore carriers and combination carriers of length, L , 150 m or above, the loading instrument is to be additionally capable of verifying that the following are within permissible limits:

- (a) the mass of cargo and double bottom ballast in way of each hold as a function of the draught at the mid-hold position.
- (b) the mass of cargo and double bottom ballast for any two adjacent holds as a function of the mean draught in way of these holds. The mean draught may be calculated by averaging the draught at the two mid-hold positions.

For bulk carriers for which it is required to undertake longitudinal strength calculations in the flooded condition, see Pt 4, Ch 7, 1.2 Application, the loading instrument is also to be capable of verifying that the still water bending moments and shear forces in hold flooded conditions (see Pt 4, Ch 7, 3.4 Flooded conditions) are within permissible limits.

8.3.4 If the approved loading manual utilises bulkhead correction factors for shear force distribution, then the loading instrument must also have the capability to account for the bulkhead correction factors.

8.3.5 The instrument is to be certified in accordance with LR's document entitled *Approval of Longitudinal Strength and Stability Calculations Programs*.

8.3.6 The instrument readout points are usually selected at the position of the transverse bulkheads or other obvious boundaries. As many readout points as considered necessary by LR are to be included, e.g. between bulkheads.

8.3.7 A notice is to be displayed on the loading instrument stating:

- (a) 'Scantlings approved for minimum draught forward of ...m with ballast tanks No... filled. In heavy weather conditions, the forward draught should not be less than this value. If, in the opinion of the Master, sea conditions are likely to cause regular slamming, then other appropriate measures such as change in speed, heading or an increase in draught forward may also need to be taken.'

8.3.8 Where alteration to structure, lightweight or cargo distribution is proposed, the loading instrument is to be modified accordingly and details submitted for approval.

8.3.9 The operation of the loading instrument is to be verified by the Surveyors upon installation and at Annual and Periodical Surveys as required in Pt 1, Ch 3 Periodical Survey Regulations. An Operation Manual for the instrument is to be verified as being available on board.

8.3.10 Where an onboard computer system having a strength computation capability is provided as an Owner's option, it is recommended that the system be certified in accordance with LR's document entitled *Approval of Longitudinal Strength and Stability Calculations Programs*. For systems having a stability computation capability and installed on a new ship, see also Pt 1, Ch 2, 1.1 General. For systems having a stability computation capability and installed on an existing ship, it is recommended that the system be certified in accordance with LR's document entitled *Approval of Longitudinal Strength and Stability Calculation Programs*.

8.4 Onboard lashing program

8.4.1 An onboard lashing program to calculate forces acting on the container stowage arrangement may be provided, see Pt 3, Ch 14 Cargo Securing Arrangements. This may be an extension to the loading instrument covered under Pt 3, Ch 4, 8.3 Loading instrument. If the software to carry out lashing calculations is installed and maintained in accordance with the Rules, the ship will be eligible to be assigned the special features notation **BoxMax**, with one or more of the supplementary letters **V** and **W**.

8.4.2 To qualify for the notation **BoxMax** the following requirements must be satisfied:

- (a) The onboard lashing program is to be certified in accordance with LR's *Approval of Longitudinal Strength and Stability Calculation Programs*.
- (b) Where alteration to the container stowage arrangements is proposed, the onboard lashing program is to be modified accordingly and details submitted for approval.
- (c) The operation of the onboard lashing program is to be verified by the Surveyors upon installation and at Annual and Periodical Surveys as required in Pt 1, Ch 3 Periodical Survey Regulations. An Operation Manual for the onboard lashing program is to be verified as being available on board.

8.4.3 The onboard lashing program may also have the capability to take account of the various sea areas through which the container ship may trade. If the software to carry out lashing calculations is installed and maintained in accordance with the Rules and includes the functionality to take account of voyage route using the methodology and factors supplied by LR, the ship will be eligible to be assigned the special features notation **BoxMax(V)**.

8.4.4 To qualify for the notation **BoxMax(V)** the following requirements must be satisfied:

- (a) The requirements for **BoxMax** must be satisfied.
- (b) The benefits of the notation may only be applied in sea areas for which LR has provided the factors for the ship. Elsewhere, the weather-dependent factors must be set to the values defined for unrestricted worldwide service, see Pt 3, Ch 14, 1.5 Symbols and definitions.

-
- (c) The voyage-specific aspects of the onboard lashing program are to be verified by the Surveyors upon installation and at Annual and Periodical Surveys as required in Pt 1, Ch 3 Periodical Survey Regulations. An Operations Manual for these aspects of the onboard lashing program is to be verified as being available on board.

8.4.5 The onboard lashing program may also have the capability to take account of the various seasons during which the container ship may trade. If the software to carry out lashing calculations is installed and maintained in accordance with the Rules and includes the functionality to take account of voyage route and season using the methodology and factors supplied by LR, the ship will be eligible to be assigned the special features notation **BoxMax(V,W)**.

8.4.6 To qualify for the notation **BoxMax(V,W)** the following requirements must be satisfied:

- (a) The requirements for **BoxMax(V)** must be satisfied.
- (b) The benefits of the notation may only be applied in sea areas and during seasons for which LR has provided the factors for the ship. If the required sea areas and seasons are not fully covered by the factors provided by LR, the weather-dependent factors must be set to the values defined for the notation **BoxMax(V)**, if available, or for unrestricted worldwide service, see Pt 3, Ch 14, 1.5 Symbols and definitions.
- (c) The voyage- and season-specific aspects of the onboard lashing program are to be verified by the Surveyors upon installation and at Annual and Periodical Surveys as required in Pt 1, Ch 3 Periodical Survey Regulations. An Operation Manual for these aspects of the onboard lashing program is to be verified as being available on board.

- 6 **Fore peak structure**
- 7 **Forward deep tank structure**

■ *Section 1* **General**

1.1 Application

1.1.1 This Chapter applies to all types of ship covered by Pt 4 Ship Structures (Ship Types) except where specifically stated otherwise.

1.1.2 The requirements given are those specific to fore ends and relate to structure situated in the region forward of 0,3L from the forward perpendicular.

1.1.3 Requirements for cargo space structure within this region not dealt with in this Chapter are to be as detailed in the relevant Chapter of Pt 4 Ship Structures (Ship Types) for the particular ship type.

1.1.4 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. See Pt 1, Ch 2, 2.3 Class notations (hull).

1.2 Structural configuration

1.2.1 The Rules provide for both longitudinal and transverse framing systems.

1.2.2 In the case of container ships and open type ships, additional requirements may apply as detailed in Pt 4, Ch 8 Container Ships.

1.2.3 In the case of fast cargo ships, the additional requirements given in Pt 4, Ch 1, 3 Longitudinal strength are to be complied with where applicable.

1.2.4 The requirements regarding minimum bow height given in Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle are to be complied with where applicable.

1.3 Structural continuity

1.3.1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes.

1.3.2 Where longitudinal framing terminates and is replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover. Where a forecastle is fitted extending aft of 0,15L from the F.P., longitudinal framing at the upper deck and topsides is generally to be continued forward of the end bulkhead of this superstructure. In bulk carriers and oil tankers (see Pt 3, Ch 5, 1.1 Application) the longitudinal framing at the upper deck is to be maintained over the cargo space region and continued over the fore peak region.

1.3.3 In container or similar ships having continuous side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are to be continued as far forward as is practicable and are to be suitably tapered at their ends. Where, due to the ship's form, such bulkheads are stepped, suitable scarfing is to be arranged.

1.3.4 In bulk carriers (see Pt 3, Ch 5, 1.1 Application) the topside tank and double bottom hopper tank structures are to be maintained over the cargo space region, and suitable taper brackets are to be arranged in line with the end of these tank structures in the fore peak region. In addition, in way of the cargo space forward bulkhead, a girder or intercostal bulb plate stiffeners (fitted between and connected to the bulkhead vertical stiffeners), are to be arranged on the forward side in line with the sloped bulkheads of the topside and hopper tanks clear of the taper brackets.

1.4 Symbols and definitions

1.4.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L, B, D = as defined in Pt 3, Ch 1, 6.1 Principal particulars

T, C_b
and V

$k_L k$ = higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel

l = overall length of stiffening member, in metres, see Pt 3, Ch 3, 3.3 Determination of span point

l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3, 3.3 Determination of span point

s = spacing of secondary stiffeners, in mm

t = thickness of plating, in mm

I = inertia of stiffening member, in cm^4 , see Pt 3, Ch 3, 3.2 Geometric properties of section

S = spacing, or mean spacing, of primary members, in metres

Z = section modulus of stiffening member, in cm^3 , see Pt 3, Ch 3, 3.2 Geometric properties of section

ρ = relative density (specific gravity) of liquid carried in a tank and is to be taken not less than 1,025.

1.4.2 For the purpose of this Chapter the forward perpendicular, F.P., is defined as the forward limit of the Rule length L .

1.5 Strengthening of bottom forward

1.5.1 The bottom forward of a sea-going ship is to be additionally strengthened, except where the ship is so designed that a minimum draught forward, T_{FB} , of $0,045L$ can be achieved for any ballast or part loaded condition. This draught is to be indicated on the shell expansion plan, the plan showing the internal strengthening, the Loading Manual and loading instrument, where fitted, see Pt 3, Ch 4, 8 Loading guidance information.

1.5.2 The requirements for the additional strengthening apply to ships where L is greater than 65 m. Where a ship is classed for service in protected waters or extended protected waters, compliance with the requirements of this Section may be modified or waived altogether.

1.5.3 The additional strengthening is to extend forward of $0,3L$ from the F.P. over the flat of bottom and adjacent plating with attached stiffeners up to a height of $0,002L$ above the base line or 300 mm whichever is the lesser.

1.5.4 The scantling requirements outside the areas defined in Pt 3, Ch 5, 1.5 Strengthening of bottom forward are to be suitably tapered to maintain adequate continuity of strength in both longitudinal and transverse directions.

1.5.5 The requirements for the additional strengthening within the region defined in Pt 3, Ch 5, 1.5 Strengthening of bottom forward are given in Table 5.1.1 Additional strengthening of bottom forward, or may be obtained by direct calculation. Where T_{FB} is less than $0,01L$, the additional strengthening is to be specially considered.

1.5.6 Bottom longitudinals are to pass through and be supported by the webs of primary members. The vertical web stiffeners are to be connected to the bottom longitudinals. The cross-sectional area of the connections is to comply with the requirements given in Table 5.1.1 Additional strengthening of bottom forward.

1.5.7 The scantlings required by this Section must in no case be less than those required by the remaining Sections in Pt 3, Ch 5 Fore End Structure.

1.5.8 For minimum draught forward, T_{FB} between $0,01L$ and $0,045L$, the equivalent slamming pressure expressed as a head of water, h_s , is to be obtained from Figure 5.1.1 Pressure heads, where h_{max} is calculated from the following expressions:

$$65 < L \leq 169 \text{ m}, h_{max} = 10\sqrt{L} F \text{ m}$$

$$169 < L \leq 180 \text{ m}, h_{max} = 130F \text{ m}$$

$$L > 180 \text{ m}, h_{max} = 130 F e^{-0,0125(L-180)^{0,705}} \text{ m}$$

where

$$F = 5,95 - 10,5 \left(\frac{T_{FB}}{L} \right)^{0,2}$$

= and

e = base of natural logarithms, 2,7183

- The application of the maximum pressure for forward of $0,3L$ from the F.P. is as indicated in Figure 5.1.1 Pressure heads. For C_b between $0,70$ and $0,80$ its position may be obtained by linear interpolation.
- Where the bottom plating forms the boundary of a double bottom tank, deep tank or double skin tank which is full in all ballast conditions, then for such conditions the head, h_s , may be reduced by 1,25 times the head, in metres, of ballast water to top of tank.
- For bulk carriers (see Pt 3, Ch 5, 1.1 Application) the reduction to the head, h_s , is not to exceed the head, in metres, of ballast water to the top of the hopper tank or 1,25 times the depth, in metres, of the double bottom tank, whichever is the greater.
- For ballast and part loaded conditions where the draught forward is less than $0,045L$ and the reduction to the head, h_s , has been applied, the ballast tanks are to be filled and a note added to the loading booklet to this effect, see Pt 3, Ch 4, 8.2 Loading Manual.

Figure 5.1.1: Pressure heads

1.6 Strengthening against bow flare slamming

1.6.1 The requirements of this Section apply to all ships except those defined in Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships and Pt 4, Ch 8 Container Ships.

1.6.2 The side structure in the area forward of $0,075L$ from the F.P. and above the summer load waterline is to be strengthened against bow flare impact pressure. The strengthening is to extend vertically to the uppermost deck level, including the forecastle deck, if fitted, but need not exceed the level of $T + 1,65H_b$ above the base line, where H_b is the minimum bow height, in metres, as derived in Pt 3, Ch 1, 6.1 Principal particulars.

1.6.3 The flare angle, α , is the angle between the vertical axis and the tangent of the outer shell measured normal to the shell in a vertical plane, at the point under consideration. The entry angle, β , is the angle between the longitudinal axis and the

Fore End Structure

Part 3, Chapter 5

Section 1

waterplane tangent measured on the outer shell, at the point under consideration. The flare angle may normally be derived in accordance with Figure 5.1.2 Flare angle determination.

Part 3, Chapter 5

Section 1

<p>(4) Primary structure in way of single bottoms</p>	<p>(a) Centre girder:</p> <p>Scantlings as required by item (1) in Table 5.5.1 Single bottom construction forward, except that in determining Z in way of a deep tank forward of $0,2L$ from the F.P. the value of h_5 is to be increased by the following percentages:</p> <p>where $T_{FB} \leq 0,03L_2$, 30 per cent</p> <p>where $T_{FB} \geq 0,04L_2$, 0 per cent</p> <p>The increase in h_5 for intermediate values of T_{FB} to be obtained by interpolation</p> <p>(b) Floors:</p> <p>Scantlings as required by item (2) in Table 5.5.1 Single bottom construction forward, except that in way of dry cargo spaces the minimum face area is to be increased by the following percentages:</p> <p>where $T_{FB} \leq 0,03L_2$, 50 per cent</p> <p>where $T_{FB} \geq 0,04L_2$, 0 per cent</p> <p>The increase of minimum face area for intermediate values of T_{FB} is to be obtained by interpolation</p> <p>(c) Side girders:</p> <p>Arrangement and scantlings as required by Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing and Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing, with the addition of intermediate half-height girders or equivalent fore and aft stiffening</p>	<p>(a) Ships having one or more longitudinal bulkheads:</p> <p>(i) Centre girder</p> <p>Scantlings as required by item (4) in Table 5.5.1 Single bottom construction forward and (iii)</p> <p>(ii) Bottom transverses</p> <p>Maximum spacing</p> <p>As for midships region</p> <p>Scantlings as required by Pt 4, Ch 9, 9 Primary members supporting longitudinal framing or Pt 4, Ch 10, 2 Primary members supporting longitudinal framing</p> <p>(iii) For horizontally stiffened longitudinal bulkheads and girders the depth to thickness ratio of the panel attached to the bottom shell plate is not to exceed $55\sqrt{k}$</p> <p>(iv) Where $T_{FB} < 0,025L_2$ the scantlings and arrangements will receive individual consideration</p> <p>(b) Other ship arrangements will receive individual consideration</p>
<p>(5) Primary structure in way of double bottoms, see Note 3</p>	<p>(a) Plate floors:</p> <p>Maximum spacing, every frame</p> <p>Scantlings as required by Pt 4, Ch 1, 8 Double bottom structure</p> <p>(b) Centre and side girders:</p> <p>Maximum spacing, $0,003S_F$ m</p> <p>(c) Intermediate half-height girders to be arranged midway between side girders:</p> <p>Scantlings as required for non watertight side girders by Pt 4, Ch 1, 8 Double bottom structure</p>	<p>(a) Plate floors:</p> <p>Maximum spacing:</p> <p>$0,002s_F$ m for $T_{FB} < 0,04L_2$</p> <p>$0,003s_F$ m for $T_{FB} \geq 0,04L_2$</p> <p>but not to exceed that required by item (2) in Table 5.5.2 Double bottom construction forward</p> <p>Scantlings as required by Pt 4, Ch 1, 8 Double bottom structure</p> <p>(b) Centre and side girders:</p> <p>Maximum spacing:</p> <p>$0,003s_L$ m for $T_{FB} < 0,04L_2$</p> <p>$0,004s_L$ m for $T_{FB} > 0,04L_2$</p>

Fore End Structure

Part 3, Chapter 5

Section 1

		but not to exceed that required by item (4) in Table 5.5.2 Scantlings as required by Pt 4, Ch 1, 8 Double bottom structure
(6) Primary structure in way of double bottoms supported by longitudinal bulkheads	–	The scantlings and arrangements will receive individual consideration on the basis of direct calculations using, if necessary, a suitably defined two-dimensional grillage model, see Pt 3, Ch 1, 3 Equivalents
Symbols		
<p>L, T, s, k as defined in Pt 3, Ch 5, 1.4 Symbols and definitions</p> <p>$c = 1,0$ for $S \leq 2,5$ m $= (0,87 + 0,16S) c_1$ for $S > 2,5$ m</p> <p>$c_1 = 1,0$ for $S \leq 1,0$ m $= (1,14 - 0,14S)$ for $1,0 \text{ m} < S \leq 4,0$ m $= \frac{2,32}{S}$ for $S > 4,0$ m</p> <p>d_w = web depth, in mm, which for bulb flats may be taken as 0,9 times the section height</p> <p>$f = \left(1,1 - \frac{s}{2500S}\right)$ $=$ but not greater than 1,0</p> <p>h_s = equivalent slamming pressure, in metres obtained from Pt 3, Ch 5, 1.5 Strengthening of bottom forward</p> <p>$l_s = l_e$, in metres, as defined in Pt 3, Ch 5, 1.4 Symbols and definitions where in way of a double bottom $= S$, in metres, where in way of a single bottom</p> <p>S = spacing of primary members, in metres</p> <p>$p = 9,81 h_s c_1 \left[S - \frac{s}{2000}\right] \times 10^{-3}$ kN $= \left(h_s c_1 \left[S - \frac{s}{2000}\right] \times 10^{-3} \text{ tonne} - f\right)$</p> <p>$s_F$ = spacing of transverse frames, in mm, for longitudinally framed side and bottom construction s_F may be taken as s_L</p> <p>s_L = spacing of bottom longitudinals, in mm</p> <p>t_w = web thickness, in mm</p> <p>A_f = cross-sectional area of primary member web stiffener, in cm^2</p> <p>A_{fc} = effective area of primary member web stiffener in way of butted end connection to the longitudinal, in cm^2</p>		

A_L = area of weld of lapped connection, in cm², calculated as total length of weld, in cm × throat thickness, in cm

A_w = area of weld of lug and web connection to the longitudinal, in cm², calculated as total length of weld in cm × throat thickness, in cm

A_1 = effective total cross-sectional area of the lug and web connection to the longitudinal, in cm²

L_2 = L but need not be taken greater than 215 m

T_{FB} = draught, in metres, at the F.P., as defined in Pt 3, Ch 5, 1.5 Strengthening of bottom forward

α = $A_f \bar{\sigma}$ for the web stiffeners

= $A_{fc} \bar{\sigma}$ for a butted connection to the longitudinals

= $A_L \bar{\tau}$ for a lapped connection

$\bar{\sigma}$ = permissible direct stress, in N/mm² (kgf/mm²), given in Table 5.1.2 Permissible stresses

$\bar{\tau}$ = permissible shear stress, in N/mm² (kgf/mm²), given in Table 5.1.2 Permissible stresses

Note 1. If intermediate stiffening is fitted the thickness of the bottom shell plating may be 80 per cent of that required by (1) but is to be not less than the normal taper thickness.

Note 2. For transverse framing the bottom shell plating is to be specially considered.

Note 3. Particular care is to be taken to limit the size and number of openings in way of the ends of floors or girders or to fit suitable reinforcement where such openings are essential.

Note 4. The welding requirements of Pt 3, Ch 10 Welding and Structural Details, and in cargo oil tanks of tankers, the requirements of Pt 4, Ch 9, 10.14 Arrangements at intersections of continuous secondary and primary members or Pt 4, Ch 10, 7.14 Arrangements at intersections of continuous secondary and primary members, are also to be complied with.

1.6.4 The equivalent bow flare slamming head, h_s , is to be taken as:

$$h_s = 0,8(0,2 + 1,5 \tan \alpha) \left(0,51V \sin \beta \cos \alpha + \frac{\pi}{\sqrt{L}} \delta \right)^2 \text{ m}$$

where

V = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions

α = flare angle, in degrees, at the point under consideration

β = entry angle, in degrees, at the point under consideration

$\delta = \left(\frac{\pi}{30} L e^{-0,0033L} - 0,5d \right)$ and is not to be taken less than zero

e = base of natural logarithms 2,7183

d = vertical distance, in metres, between the waterline at draught T and the point under consideration.

1.6.5 The thickness of the side shell is to be not less than:

$$t = 3,2s_C \sqrt{kh_s} C_R \times 10^{-2} \text{ mm}$$

where

s_C = spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 5.1.3 Chord spacing and mean chord spacing for secondary members

h_S = bow flare slamming head, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming

C_R = panel ratio factor

$$= \left(\frac{l}{s_C} \right)^{0,41} \text{ but is not to be taken less than } 0,06 \text{ or greater than } 0,1$$

l = overall panel length, in metres, measured along a chord between the primary members.

1.6.6 The scantlings of secondary stiffeners are not to be less than:

(a) Section modulus of secondary stiffeners

$$Z = 3,6 s_{CM} k h_s l_e^2 \times 10^{-3} \text{ cm}^3$$

(b) Web area of secondary stiffeners

$$A = 3,7 s_{CM} k h_s (l_e - s_{CM}/2000) \times 10^{-4} \text{ cm}^2$$

where

s_{CM} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 5.1.3 Chord spacing and mean chord spacing for secondary members

h_S = bow flare slamming head, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming

= Other symbols are as defined in Pt 3, Ch 5, 1.4 Symbols and definitions.

Table 5.1.2: Permissible stresses

Item		Direct stress, σ in N/mm ² (kgf/mm ²) see Note	Shear stress, τ in N/mm ² (kgf/mm ²)
Primary member web stiffener on area A_f	(a) Flat bars see Note	$\frac{10,3}{k} \left[33 - \frac{d}{t\sqrt{k}} \right]$ $\left(\frac{1,05}{k} \left[33 - \frac{d}{t\sqrt{k}} \right] \right)$	— —
	(b) Bulb plates see Note	$\frac{8,6}{k} \left[40 - \frac{d}{\left(\frac{100A_f}{d} - \frac{t}{6} \right) \sqrt{k}} \right]$ $\left(\frac{0,88}{k} \left[40 - \frac{d}{\left(\frac{100A_f}{d} - \frac{t}{6} \right) \sqrt{k}} \right] \right)$	— —
	(c) Inverted angles	$\frac{220}{k} \left(\frac{22,4}{k} \right)$	—

Fore End Structure

Part 3, Chapter 5

Section 1

Primary member web stiffener on area A_{fc}		$\frac{245}{k} \left(\frac{25}{k} \right)$	—
Primary member web stiffener lapped to secondary member on area A_L		—	$\frac{167}{k} \left(\frac{17}{k} \right)$
Lug or web connection on area A_1	Single	—	$\frac{124}{k} \left(\frac{12,6}{k} \right)$
	Double	—	$\frac{141}{k} \left(\frac{14,4}{k} \right)$
Symbols			
A_f, A_L, A_1 as defined in Table 5.1.1 Additional strengthening of bottom forward d = stiffener depth, in mm k = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions t = stiffener web thickness, in mm			
Note σ to be taken not greater than $\frac{220}{k} \left(\frac{22,4}{k} \right)$			

1.6.7 The scantlings of primary members are not to be less than:

(a) Section modulus of primary members

$$Z = 2S_{CM} k h_s l_e^2 \text{ cm}^3$$

(b) Web area of primary members

$$A = 0,2S_{CM} k h_s l_e \text{ cm}^2$$

where

S_{CM} = mean spacing of primary members, in metres, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 5.1.4 Mean chord spacing for primary members

h_s = bow flare slamming head, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming
= Other symbols are as defined in Pt 3, Ch 5, 1.4 Symbols and definitions.

1.6.8 For primary members with cut-outs for the passage of secondary stiffeners, and which may have web stiffeners connected to the secondary stiffener, buckling checks are to be carried out to ensure that the primary member web plating and web stiffener will not buckle under the design load. The buckling procedure to be followed is given in Table 5.1.3 Buckling procedure for primary member web plating and web stiffener. Where the web stiffener is fitted with a bracket, the buckling capability of the web stiffener in way of the cut-out is to take account of the bracket. Where no web stiffener is fitted, the buckling capability of the primary member web plating is to be checked for the total load transmitted to the connection.

1.6.9 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered from 0,075L aft of fore perpendicular to meet the normal requirements at 0,15L aft of the fore perpendicular.

1.6.10 Where the stiffener web is not perpendicular to the plating, tripping brackets may need to be fitted in order to obtain adequate lateral stability.

1.6.11 For stiffeners and primary structure, where the angle between the stiffener web and the plating is less than 70°, the effective section modulus and shear area are to take account of the non-perpendicularity.

1.6.12 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of Pt 3, Ch 5 Fore End Structure.

Figure 5.1.2: Flare angle determination

Figure 5.1.3: Chord spacing and mean chord spacing for secondary members

Figure 5.1.4: Mean chord spacing for primary members

Figure 5.1.5: Dimensions of critical areas of (a) primary member web plating and (b) primary web stiffener

Table 5.1.3: Buckling procedure for primary member web plating and web stiffener

Steps	Members	
	Primary member web plating	Primary member web stiffener
Determination of the design compressive stress, σ_A , N/mm ² (kgf/mm ²)	$\sigma_A = \frac{1000P_W}{A_W}$	$\sigma_A = \frac{1000P_S}{A_S}$
Determination of the elastic critical buckling stress, σ_E , in compression, N/mm ² (kgf/mm ²)	$\sigma_E = \frac{9,87EI_W}{l_W^2 A_W}$	$\sigma_E = \frac{9,87EI_S}{l_S^2 A_S}$
Determination of the corrected critical buckling stress, σ_{CR} , in compression, N/mm ² (kgf/mm ²)	$\sigma_{CR} = \sigma_o \left(1 - \frac{\sigma_o}{4 \sigma_E} \right) \text{ where } \sigma_E > \frac{\sigma_o}{2}$ $\sigma_{CR} = \sigma_E \text{ where } \sigma_E \leq \frac{\sigma_o}{2}$	
Requirement	$\sigma_{CR} \geq \sigma_A$	
Symbols		
b_W, b_S, l_W , and l_S are dimensions, in mm, as shown in Figure 5.1.5 Dimensions of critical areas of (a) primary member web plating and (b) primary web stiffener		
h_S = equivalent bow flare slamming head, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming		
s_{CM} = mean spacing of secondary stiffeners, in mm, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming		
t_W = thickness of primary member web plating, in mm		
t_S = thickness of primary member web stiffener, in mm		
$A_W = b_W t_W \text{ mm}^2$		
$A_S = b_S t_S \text{ mm}^2$		
E = modulus of elasticity, in N/mm ² (kgf/mm ²) = 206000 N/mm ² (21000 kgf/mm ²) for steel		
$I_W = \frac{b_W t_W^3}{12} \text{ mm}^4$		
$I_S = \frac{b_S t_S^3}{12} \text{ mm}^4$		
P = total load transmitted to the connection = 10,06 $S_{CM} s_{CM} h_S \times 10^{-3}$ kN		
$(P = 1,025 S_{CM} s_{CM} h_S \times 10^{-3}$ tonne-f)		

P_W = load transmitted through the primary member web stiffener, in kN (tonne-f)

= $P - P_S$, or by direct calculations

P_S = load transmitted through the primary member web stiffener, in kN (tonne-f), to be determined from Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members, or by direct calculations

S_{CM} = mean spacing of primary members, in metres, as defined in Pt 3, Ch 5, 1.6 Strengthening against bow flare slamming

σ_o specified minimum yield stress, in N/mm²(kgf/mm²)

■ *Section 2* **Deck structure**

2.1 General

2.1.1 Where the upper deck is longitudinally framed outside the line of openings in the midship region, this system of framing is to be carried as far forward as possible. In the case of oil tankers (see Pt 3, Ch 5, 1.1 Application) longitudinal framing is to extend to at least the forward end of the cargo tank section.

2.2 Deck plating

2.2.1 The thickness of strength/weather deck plating is to comply with the requirements of Table 5.2.1 Strength/weather deck plating forward (excluding forecastle deck).

2.2.2 The thickness of lower deck plating is to comply with the requirements of Table 5.2.2 Lower deck plating forward.

2.2.3 The taper thickness of the strength deck stringer plate is to be increased by 20 per cent at the end of a forecastle or bridge where the end bulkhead is situated aft of 0,25L from the F.P. No increase is required where the end bulkhead lies forward of 0,2L from the F.P. The increase at intermediate positions is to be determined by interpolation.

2.2.4 The deck plating thickness and supporting structure are to be suitably reinforced in way of the anchor windlass and other deck machinery, and in way of cranes, masts or derrick posts.

2.2.5 Where long, wide hatchways are arranged at lower decks, it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

2.3 Deck stiffening

2.3.1 The scantlings of strength/weather deck longitudinals are to comply with the requirements of Table 5.2.3 Strength/weather deck longitudinals forward.

2.3.2 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements given in Table 1.4.4 Cargo and accommodation deck longitudinals in Pt 4, Ch 1 General Cargo Ships.

2.3.3 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength.

2.3.4 The scantlings of weather deck beams are to comply with the requirements of Table 5.2.4 Weather deck beams forward.

2.3.5 The scantlings of lower deck beams are to comply with the requirements of Table 1.4.5 Strength/weather, cargo and accommodation deck beams in Pt 4, Ch 1 General Cargo Ships.

Fore End Structure

Part 3, Chapter 5

Section 2

Table 5.2.1: Strength/weather deck plating forward (excluding forecastle deck)

Symbols	Location	Thickness, in mm
L, D, T, s, S, k, ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions $C = \left(\frac{D + 2,3 - T}{\text{height of deck above load waterline at F.P.}} \right)$ but is to be taken not greater than 1,0 nor less than 0,9	(1) Forward of 0,075L from the F.P.	$t = (6,5 + 0,02L) C \sqrt{\frac{k s_1}{s_b}}$
$s_1 = s$, but to be taken not less than s_b s_b = standard frame spacing as follows: (a) forward of 0,05L from the F.P.: $s_b = \left(470 + \frac{L}{0,6} \right)$ mm or 600 mm,	(2) Between 0,075L and 0,2L from the F.P.	The greater of the following: (a) $t = (5,5 + 0,02L) C \sqrt{\frac{k s_1}{s_b}}$ (b) the taper thickness (see Notes 1, 2 and 3) (c) For oil tankers, the thickness is also to be in accordance with Pt 4, Ch 9, 4.3 Deck plating
whichever is the lesser	(3) Aft of 0,2L from the F.P.	The taper thickness (see Notes 1, 2 and 3) or as (2) (c) whichever is the greater
(b) between 0,05L and 0,2L from the F.P.:	(4) Inside forecastle extending aft of 0,15L from the F.P.	As for a lower deck (see Note 4)
$s_b = \left(470 + \frac{L}{0,6} \right)$ mm or 700 mm, whichever is the lesser $f = 1,1 - \frac{s}{2500S}$ but to be taken not greater than 1,0 h_4 = tank head, in metres, as defined in Ch 3,5	(5) In way of crown of a tank	$t = 0,004 s f \sqrt{\frac{\rho k h_4}{1,025}} + 3,5$ or as in (1) to (4) as applicable, whichever is the greater but not less than: 7,5 mm where $L \geq 90$ m, or 6,5 mm where $L < 90$ m
<p>Note 1. The taper thickness is to be determined from Table 3.2.1 Taper requirements for hull envelope.</p> <p>Note 2. For taper area requirements, see Table 3.2.1 Taper requirements for hull envelope.</p> <p>Note 3. For thickness of upper deck plating in way of the cargo and fore peak tanks of oil tankers or ore carriers, see also Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.</p> <p>Note 4. The exposed deck taper thickness is to extend into a forecastle or bridge for at least one-third of the breadth of the ship from the superstructure end bulkhead.</p> <p>Note 5. The taper requirements from Table 3.2.1 Taper requirements for hull envelope in Pt 3, Ch 3 Structural Design do not apply to container ships or open ship types, see Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. See also Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.</p>		

Table 5.2.2: Lower deck plating forward

Symbols	Location	Thickness, in mm
<p>L, s, S, k, ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions</p> <p>b = breadth of increased plating, in mm</p> <p>$f = 1, 1 - \frac{s}{2500S}$ but is to be taken not greater than 1,0</p> <p>h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>K_2 = 2,5 mm at bottom tank, or = 3,5 mm at crown of tank</p> <p>s_1 = s, but is to be taken not less than $\left(470 + \frac{L_1}{0,6}\right)$ mm</p> <p>A_f = girder face area, in cm²</p> <p>L_1 = L, but need not be taken greater than 190 m</p> <p>Note 1. Where the deck loading exceeds 43,2 kN/m² (4,4 tonne-f/m²), the thickness of plating will be specially considered. This is equivalent to a 'tween deck height of 6,1 m in association with the standard stowage rate 1,39 m³/tonne.</p> <p>Note 2. For minimum thickness of deck plating in oil tankers, see Pt 4, Ch 9, 10.2 Compartment minimum thickness.</p>	(1) Forward of 0,075L from the F.P.	$t = 0,01s_1\sqrt{k}$ but not less than 6,5 mm
	(2) Aft of 0,075L from the F.P., inside line of openings	$t = 0,01s_1\sqrt{k}$ but not less than 6,5 mm
	(3) Aft of 0,075L from the F.P., outside line of openings	As determined by a taper line from the midship thickness to the end thickness given by (1)
	(4) In way of crown or bottom of tank	$t = 0,004fs\sqrt{\frac{\rho kh_4}{1,025}} + K_2$ or as in (1), (2) or (3) as applicable, whichever is the greater but not less than: = 7,5 mm where $L \geq 90$ m, = 6,5 mm where $L < 90$ m
	(5) Plating forming the upper flange of underdeck girders	<p>Clear of cargo hatches $t = \sqrt{\frac{A_f}{1,8k}}$</p> <p>In way of hatch side girders $t = 1,1\sqrt{\frac{A_f}{1,8k}}$</p> <p>Minimum breadth $b = 760$ mm</p>

2.3.6 End connections of beams are to be in accordance with the requirements of Pt 3, Ch 10, 3 Secondary member end connections.

2.4 Deck supporting structure

2.4.1 The arrangements and scantlings of supporting structure are generally to be in accordance with the requirements given in Pt 4, Ch 1, 4 Deck structure using the heads given in Pt 3, Ch 3, 5 Design loading for the particular region concerned, except as required by Pt 3, Ch 5, 2.4 Deck supporting structure to Pt 3, Ch 5, 2.4 Deck supporting structure.

2.4.2 The spacings of girders and transverses are generally not to exceed the values given in Table 5.2.5 Spacing of girders and transverses under strength/weather decks forward.

2.4.3 Primary structure in the topside tanks of bulk carriers is to comply with the requirements of Pt 4, Ch 7, 7 Topside tank structure.

2.4.4 Primary structure in the cargo tanks of oil tankers and ore carriers is to be determined from Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.

2.5 Deck openings

2.5.1 In dry cargo ships the requirements for deck openings given in Pt 4, Ch 1, 4 Deck structure are generally applicable throughout the forward region, except that forward of 0,25L from the F.P.:

- The radii or dimensions of the corners of main cargo hatchway openings on the strength deck are to be in accordance with the requirements of Pt 4, Ch 1, 4.5 Deck openings. The thickness of the insert plates, where required, is not to be less than 20 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 3 mm.
- Insert plates will be required at lower decks in way of any rapid change in hull form to compensate for loss of deck cross-sectional area. Otherwise, insert plates will not normally be required.
- Compensation and edge reinforcement for openings outside the line of main hatchways will be considered, bearing in mind their position, the deck arrangements and the type of ship concerned.

2.5.2 For deck openings in way of the cargo tanks in oil tankers and ore carriers, see *a/s* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable. For main cargo hatchway openings on bulk carriers and container ships, see *a/s* Pt 4, Ch 7 Bulk Carriers and Pt 4, Ch 8 Container Ships, as applicable.

Table 5.2.3: Strength/weather deck longitudinals forward

Location	Modulus, cm ³	Inertia, cm ⁴
(1) Forward of 0,075L from the F.P.	The greater of the following: (a) $Z = sk(635h_1 + 0,0078(l_e L_1)^2) \times 10^{-4}$ (b) $Z = 0,0127skh_1 l_e^2$	—
(2) At 0,075L from the F.P., for end modulus for taper	The greater of the following: (a) $Z_e = sk(485h_0 + 0,0062(l_{e1} L_1)^2) \times 10^{-4}$ (b) $Z_e = 0,009skh_0 l_{e1}^2$	—
(3) Aft of 0,075L from the F.P., outside line of openings	As given by (4) or as determined from Table 3.2.1 Taper requirements for hull envelope whichever is the greater, see Note 1	—
(4) At 0,075L and between 0,075L and 0,12L from the F.P.	The greater of the following: (a) $Z = sk(570h_1 + 0,0072(l_e L_1)^2) \times 10^{-4}$ (b) $Z = 0,0127skh_1 l_e^2$	—
(5) Aft of 0,12L from the F.P., inside line of main cargo hatchways openings	The greater of the following: (a) $Z = sk(400h_1 + 0,005(l_e L_1)^2) \times 10^{-4}$ (b) $Z = 0,007skh_1 l_e^2$	—
(6) In way of the crown of a tank	As (1) to (5), as applicable, or $Z = \frac{0,0113 \rho skh_4 l_e^2}{b}$ whichever is the greater	$I = \frac{2,3}{k} l_e Z$
Symbols		
L, s, k _L , k _p as defined in Pt 3, Ch 5, 1.4 Symbols and definitions		
b = 1,4 for rolled or built sections = 1,6 for flat bars		
d _w = web depth of longitudinal, in mm		

$h_o = 1,2$ m for dry cargo ships

$= \frac{L_1}{56}$ m for oil tankers (see Pt 3, Ch 5, 1.1 Application)

$h_1 =$ weather head, in metres, as defined in Pt 3, Ch 3, 5 Design loading for dry cargo ships

$= \frac{L_1}{70}$ m for oil tankers (see Pt 3, Ch 5, 1.1 Application)

$h_4 =$ tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading

l_e as defined in Pt 3, Ch 5, 1.4 Symbols and definitions, but is to be taken not less than 1,5 m

l_{e1} is to be taken as the maximum span in metres in the midship cargo tank region for oil tankers (see Pt 3, Ch 5, 1.1 Application) and equal to l_e for dry cargo ships

$L_1 = L$ but need not be taken greater than 190 m

Note 1. For area taper requirements, see *also* Table 3.2.1 Taper requirements for hull envelope.

Note 2. Where weather decks are intended to carry deck cargo and the loading is in excess of 8,5 kN/m² (0,865 tonne-f/m²), the scantlings of longitudinals may be required to be increased to comply with the requirements for location (1) in Table 1.4.4 Cargo and accommodation deck longitudinals using the equivalent design head, for specified cargo loadings, for weather decks given in Table 3.5.1 Design heads and permissible cargo loadings.

Note 3. For the scantlings of deck longitudinals forward in way of the cargo tanks of oil tankers (see Pt 3, Ch 5, 1.1 Application) or ore carriers, see *also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.

Note 4. The thickness of flat bar longitudinals situated outside the line of openings is to be not less than the following: (a) $t = \frac{d_w}{18\sqrt{k_L}}$ mm

where longitudinal continuous through bulkhead (b) $t = \frac{d_w}{15\sqrt{k_L}}$ mm where longitudinal cut at bulkhead

Note 5. The web depth of longitudinal, d_w , is to be not less than 60 mm.

Note 6. The taper requirements from Table 3.2.1 Taper requirements for hull envelope in Pt 3, Ch 3 Structural Design do not apply to container ships or open ship types, see Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. See *also* Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.

(4) Elsewhere in way of dry cargo spaces or deep tanks, see Note 1	—	3,8 m where $L \leq 100$ m (3,2 + 0,006L) m where $L > 100$ m
Note 1. For the maximum spacing of transverses in the cargo tanks of oil tankers or ore carriers, see Pt 4, Ch 9, 9 Primary members supporting longitudinal framing. Note 2. For the maximum spacing of transverses in dredgers, see Pt 4, Ch 12, 5 Shell envelope framing.		

Section 3

Shell envelope plating

3.1 General

3.1.1 Where the shell is longitudinally framed in the midship region, this system of framing is to be carried as far forward as practicable. In the case of oil tankers (see Pt 3, Ch 5, 1.1 Application), longitudinal framing is to extend at least to the forward end of the cargo tanks.

3.2 Keel

3.2.1 The scantlings of bar keels at the fore end are to be the same as in the midship region as required by Pt 4, Ch 1, 5 Shell envelope plating.

3.2.2 The thickness and width of plate keels in the forward region are to be the same as required in the midship region for the particular type of ship concerned, see Pt 4 Ship Structures (Ship Types).

3.3 Stem

3.3.1 Bar stems may be either steel castings or steel forgings complying with the requirements of Ch 3 Rolled Steel Plates, Strip, Sections and Bars of the Rules for Materials for rolled steel flat bars or Ch 5 Steel Forgings of the Rules for Materials for solid round bars. The scantlings of bar stems are to comply with Table 5.3.1 Shell plating forward.

3.3.2 The scantlings of plate stems are to be determined from Table 5.3.1 Shell plating forward. Plate stems are to be supported by horizontal diaphragms positioned in line with the side stringers or perforated flats with intermediate breasthook diaphragms. Diaphragms are to be spaced not more than 1,5 m apart, measured along the stem. Where the stem plate radius is large, a centreline stiffener or web will be required.

3.4 Bottom shell and bilge

3.4.1 The thickness of bottom shell and bilge plating in the forward region for ships not requiring additional strengthening of bottom is to comply with Table 5.3.1 Shell plating forward.

3.4.2 For thickness of bottom shell and keel when additional bottom strengthening is required, see Pt 3, Ch 5, 1.5 Strengthening of bottom forward.

3.4.3 Where longitudinals are omitted in way of radiused bilge plating amidships, the plating thickness forward will be considered in relation to the support derived from the hull form and internal stiffening arrangements.

3.5 Side shell and sheerstrake

3.5.1 The thickness of side shell and sheerstrake plating in the forward region is to be not less than the values given in Table 5.3.1 Shell plating forward, but may be required to be increased locally on account of high shear forces, in accordance with Pt 3, Ch 4, 6.5 Permissible still water shear force.

3.5.2 For transversely framed side shells where panting stringers are omitted, see Pt 3, Ch 5, 4.4 Panting stringers in way of transverse framing, the side shell plating in the region concerned is to be increased in thickness by the percentages given below:

- (a) 15 per cent, where $L \leq 150$ m
- (b) 5 per cent, where $L \geq 215$ m

For intermediate values of L , the percentage increase is to be obtained by interpolation.

3.5.3 The side shell plating of increased thickness required by Pt 3, Ch 5, 3.5 Side shell and sheerstrake is to be continued forward past the fore peak or collision bulkhead. In addition, horizontal brackets in line with the fore peak stringers are to be fitted at the aft side of the bulkhead where practicable. The brackets are to be the same thickness as the side shell and are to extend from the bulkhead to the adjacent shell frame and be connected thereto. Transversely the toes of the brackets are to extend past the outboard stiffener of the bulkhead to clear any cut out in the bulkhead stringer.

3.5.4 The sheerstrake taper thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side irrespective of position. Similar strengthening is to be fitted in way of the end of a forecastle if this occurs at a position aft of $0,25L$ from the F.P. No increase is required if the forecastle end bulkhead lies forward of $0,2L$ from the F.P. The increase at intermediate positions of end bulkhead is to be obtained by interpolation.

3.5.5 The shell plating may be required to be increased in thickness locally in way of hawse pipes, see Pt 3, Ch 13, 8.10 Structural requirements associated with anchoring.

3.5.6 The shell plating is to be increased in thickness locally in way of a bulbous bow, see Pt 3, Ch 5, 6.5 Bulbous bow.

3.6 Shell openings

3.6.1 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale, or for any deck openings situated outside the line of main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

3.6.2 Sea inlet and other openings are to have well rounded corners. The thickness of sea inlet box plating is generally to be the same as the adjacent shell. It is however, to be not less than 12,5 mm, and need not exceed 25 mm.

Table 5.3.1: Shell plating forward

Location		Thickness, in mm	
(1)	Bottom shell and bilge, <i>see also</i> 1.5 and Note 5:		Note 1. For ships where $L \leq 70$ m this thickness may be reduced by 1 mm, but it is to be not less than 6 mm.
(a)	Forward of $0,075L$ from the F.P.	$t = (6,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}}$ (see Note 1)	Note 2. The taper thickness is to be determined from Table 3.2.1 Taper requirements for hull envelope
(b)	Between $0,075L$ and $0,25L$ from the F.P., <i>see</i> Note 7	As (1)(a) or the taper thickness, whichever is the greater	Note 3. For thickness of shell plating in way of the cargo and fore peak tanks of oil tankers or ore carriers, <i>see also</i> Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

Region		Bottom shell s _b	Side shell s _b
Forward of 0,05L from the F.P.		$\left(470 + \frac{L}{0,6}\right)$ or 600*	$\left(470 + \frac{L}{0,6}\right)$ or 600*
Between 0,05L and 0,2L from the F.P.		$\left(470 + \frac{L}{0,6}\right)$ or 700*	$\left(470 + \frac{L}{0,6}\right)$ or 700*

Between 0,2L and 0,25L from the F.P.

$$\left(510 + \frac{L_2}{0,6} \right)$$

* whichever is the lesser

A_1 = cross-sectional area of bar stem below load waterline, in cm²

A_2 = cross-sectional area of bar stem at stem head, in cm²

L_2 = L , but need not be taken greater than 215 m

■ Section 4

Shell envelope framing

4.1 General

4.1.1 Requirements are given in this Section for both longitudinal and transverse framing systems. Where longitudinal framing is adopted in the midship region it is to be carried as far forward as practicable. In the case of oil tankers (see Pt 3, Ch 5, 1.1 Application), longitudinal framing is to be continued at least to the fore end of the cargo tanks.

4.1.2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength, see also Pt 3, Ch 10, 3 Secondary member end connections. Where L exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length.

4.1.3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and 0,8D above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations.

4.1.4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and 0,8D above the base line. Particular attention is to be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations.

4.1.5 For ships intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

4.2 Shell longitudinals

4.2.1 The scantlings of bottom and side shell longitudinals in the forward region are to comply with the requirements given in Table 5.4.1 Shell framing (longitudinal) forward. For the scantlings of bottom shell longitudinals where additional bottom strengthening is required, see Pt 3, Ch 5, 1.5 Strengthening of bottom forward.

Table 5.4.1: Shell framing (longitudinal) forward

Location	Modulus, in cm ³
(1) Side longitudinals in forecastle	$Z = 0,0075s k l_e^2 (0,6 + 0,167D_1)$
(2) Side longitudinals in way of dry spaces including double skin construction:	
(a) Forward of the collision bulkhead	$Z = 0,007s k h_{T1} l_e^2 F_s$ but not to be less than as required by (1)
(b) Between the collision bulkhead and 0,2L from the F.P.	As (a) above or as required in the midship region for the particular type of ship concerned, whichever is the greater. However, not to be taken less than as required by (1).

Fore End Structure

Part 3, Chapter 5

Section 4

(c) Aft of 0,2L from the F.P.	As required in the midship region for the particular type of ship concerned.
(3) Side longitudinals in way of double skin tanks or deep tanks	The greater of the following: (a) Z as from (2) (b) As required by Pt 4, Ch 1, 9 Bulkheads for deep tanks.
(4) Bottom and bilge longitudinals	The greater of the following: (a) As required in the midship region for the particular type of ship concerned. (b) As required by Pt 3, Ch 5, 1.5 Strengthening of bottom forward, strengthening of bottom forward, where applicable.
Symbols	
<p>L, D, T, s, k, as defined in Pt 3, Ch 5, 1.4 Symbols and definitions</p> <p>l_e = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions, but is to be taken not less than 1,5m</p> <p>L_1 = L but need not be taken greater than 190 m</p> <p>F_s is a fatigue factor to be taken as follows:</p> <p>(a) For built sections and rolled angle bars:</p> $F_s = \frac{1,1}{k} \left[1 - \frac{2b_f}{b_f} (1 - k) \right] \text{ at } 0,6D_1 \text{ above the base line}$ <p>= 1,0 at D_1 and above, and F_{sb} at the base line intermediate values by linear interpolation</p> <p>F_{sb} is a fatigue factor for bottom longitudinals</p> <p>= 0,5 (1 + F_s at 0,6D_1)</p> <p>(b) For flat bars and bulb plates $\frac{b_f}{b_f}$ may be taken as 0,5</p> <p>where</p> <p>b_{f1} = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, see Fig. 9.5.1 in Pt 4, Ch 9</p> <p>b_f = the width of the face plate, in mm, of the side longitudinal under consideration, see Fig. 9.5.1 in Pt 4, Ch 9</p> <p>T_1 = T but not to be taken less than 0,65D_1</p> <p>D_1 = $T + H_b$ metres, where H_b is the minimum bow height, in metres, obtained from Pt 3, Ch 1, 6.1 Principal particulars</p> <p>h_{T1} = $f_w c_w \left(1 - \frac{h_6}{D_1 - T_1} \right) F_\lambda F_\lambda$, in metres, for longitudinals above the waterline at draught T_1 where</p> <p>$f_w \left(1 - \frac{h_6}{D_1 - T_1} \right)$ is not to be taken less than 0,7</p> <p>= $\left[h_6 + f_w c_w \left(1 - \frac{h_6}{2T_1} \right) \right] F_\lambda$, in metres, for longitudinals below the waterline at draught T_1</p>	

where

$f_w = 1,0$ at $0,2L$ from the F.P. and $1,71$ at, and forward of, $0,15L$ from the F.P. Intermediate positions by interpolation

$h_6 =$ vertical distance, in metres, from the waterline at draught T_1 , to the longitudinal under consideration

$F_{\lambda} = 1,0$ for $L \leq 200$ m
 $= [1,0 + 0,0023 (L - 200)]$ for $L > 200$ m

$C_w =$ a wave head, in metres $= 7,71 \times 10^{-2} L e^{-0,0044L}$

where

$e =$ base of natural logarithms $2,7183$

NOTE

Where struts are fitted midway between transverses in double skin construction, the modulus of the side longitudinals may be reduced by 50k per cent from that obtained for locations (2) and (3) as applicable.

4.2.2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and so far as practicable, direct continuity of longitudinal strength, see also Pt 3, Ch 10, 3 Secondary member end connections.

4.3 Shell framing

4.3.1 The scantlings of side frames in the forward region are to comply with the requirements given in Table 5.4.2 Shell framing (transverse) forward.

4.3.2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.

4.3.3 End connections of transverse main and 'tween deck frames are to be in accordance with Pt 3, Ch 10, 3 Secondary member end connections. For bulk carriers the end connections of main frames in cargo holds are to be in accordance with Pt 4, Ch 7, 6.2 Transverse stiffening to Pt 4, Ch 7, 6.2 Transverse stiffening. Where brackets are omitted at the foot of main frames in cargo spaces, small easing brackets are to be fitted forward of $0,15L$ from the F.P.

4.4 Panting stringers in way of transverse framing

4.4.1 In lower hold or deep tank spaces panting stringers are generally to be fitted in line with each stringer or flat in the fore peak space and extending back to $0,15L$ from the F.P. These stringers may be omitted if the shell plating is increased in thickness as required by Pt 3, Ch 5, 3.5 Side shell and sheerstrake. Where the span of the main frames exceeds 9 m, panting stringers are to be fitted irrespective of whether the shell plating is increased in thickness or not. These stringers are to be arranged in line with alternate stringers or flats in the fore peak and are to extend back to $0,2L$ from the F.P.

4.4.2 In 'tween deck spaces in the region forward of $0,15L$ from the F.P., where the unsupported length of frame exceeds 2,6 m in a lower 'tween deck or 3,0 m in an upper 'tween deck, intermediate panting stringers are generally to be fitted. These stringers may be omitted if the shell plating is increased in thickness as required by Pt 3, Ch 5, 3.5 Side shell and sheerstrake.

4.4.3 The scantlings of panting stringers are to be determined from Table 5.4.2 Shell framing (transverse) forward.

Table 5.4.2: Shell framing (transverse) forward

Location	Modulus, in cm^3	Inertia, in cm^4
(1) Frames in fore peak spaces and lower 'tween decks over, see Note 1	$Z = K_1 s k T D_2 S_1 \times 10^{-3}$	$I = \frac{3,5}{k} S_1 Z$
(2) Frames in upper 'tween decks and forecastles forward of the collision bulkhead, see Notes 1, 2 and 8	The greater of the following: (a) $Z = C s k h_{T1} H^2 \times 10^{-3}$ (b) $Z = 9,1 s k D_1 \times 10^{-3}$	$I = \frac{3,5}{k} H Z$

Section 4

(3) Main and 'tween deck frames (including forecastle) between the collision bulkhead and 0,15L from the F.P., see Notes 1 to 4 and 8	The greater of the following: (a) $Z = C s k h_{T1} H^2 \times 10^{-3}$ (b) $Z = 9,1 s k D_1 \times 10^{-3}$	$I = \frac{3,5}{k} HZ$
(4) Main and 'tween deck frames between 0,15L and 0,2L from the F.P. in dry cargo spaces, see Notes 1 to 4 and 8	The greater of the following: (a) $Z = C s k h_{T1} H^2 \times 10^{-3}$ (b) $Z = 9,1 s k D_1 \times 10^{-3}$	$I = \frac{3,2}{k} HZ$
(5) Panting stringers, see Note 5	Web depth, d_w , same depth as frames Web thickness, $t = 6 + 0,025L_2$ mm Face area, $A = kS_2 (H + 1)$ cm ²	
(6) Main and 'tween deck frames elsewhere, see Notes 1 to 4	As required in the midship region for the particular type of ship concerned	
Symbols		
L, D, T, s, k as defined in Pt 3, Ch 5, 1.4 Symbols and definitions		
$L_2 = L$, but need not be taken greater than 215 m		
$D_1 = T + H_b$, in metres, where H_b is defined in Pt 3, Ch 1, 6.1 Principal particulars		
$D_2 = D_1$, but is to be taken not greater than 16 m, nor less than 6,0 m		
$H = H_{MF}$ or H_{TF} as applicable, see Note 7		
H_{MF} = vertical framing depth, in metres, of main frames as shown in Fig. 5.4.1 but is to be taken not less than 3,5 m, see Note 6		
H_{TF} = vertical framing depth, in metres, of 'tween deck frames as shown in Fig. 5.4.1 but is to be taken not less than 2,5 m		
$K_1 = 2,3$ for peak tanks = 1,87 for 'tween decks over peak tanks		
S_1 = vertical spacing of peak stringers or height of lower 'tween deck above the peak, in metres, as applicable		
S_2 = vertical spacing of panting stringers, in metres		
C = end connection factor = 3,4 where two Rule standard brackets fitted = 3,4 (1,8 - 0,8 (l_a / l)) where one Rule standard bracket and one reduced bracket is fitted = 3,4 (2,15 - 1,15 ($l_{a\text{mean}} / l$)) where two reduced brackets are fitted = 6,1 where one Rule standard bracket is fitted = 6,1 (1,2 - 0,2 (l_a / l)) where one reduced bracket is fitted. = 7,3 where no brackets are fitted = The requirements for frames where brackets larger than Rule standard are fitted will be specially considered		
l = length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets		

l_a = equivalent arm length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets

l_{amean} = mean equivalent arm length, in mm, for both brackets

T_1 = T but not to be taken less than $0,65D_1$

h_{T1} = head, in metres, at mid-length of H

= $f_w C_w \left(1 - \frac{h_6}{D_1 - T_1} \right) F_\lambda$, in metres for frames where the mid-length of frame is above the waterline, at draught T_1

where $f_w \left(1 - \frac{h_6}{D_1 - T_1} \right)$ is not to be taken less than 0,7

= $\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1} \right) \right] F_\lambda$, in metres for frames where the mid-length of frame is below the waterline at draught T_1

where

f_w = 1,0 at 0,2L from F.P. and 1,71 at, and forward of, 0,15L from F.P. Intermediate positions by interpolation

h_6 = vertical distance, in metres, from the waterline at draught T_1 to the mid-length of H

F_λ = 1,0 for $L \leq 200$ m

= $[1,0 + 0,0023 (L - 200)]$ for $L > 200$ m

C_w = a wave head, in metres

= $7,71 \times 10^{-2} L e^{-0,0044L}$

where e = base of natural logarithms 2,7183

NOTES

1. For framing in the fore end of fishing vessels, see Pt 4, Ch 6, 6 Shell envelope framing
2. In offshore supply ships the moduli of main and 'tween deck frames are to be 25 per cent greater than given in (2), (3) and (4).
3. In way of the cargo tanks of oil tankers or ore carriers, the scantlings of frames are also to comply with the requirements for frames in the midship region of such ships, see Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.
4. In bulk carriers the scantlings of frames are also to comply with the requirements of Pt 4, Ch 7, 6 Shell envelope framing in which the requirements of Table 7.6.1 location (1) are to be multiplied by the following factor:
Between 0,15L and 0,2L from the F.P., $C_1 = (0,018D_2 + 0,82)$, but not to be taken less than 1,0.
Between collision bulkhead and 0,15L from the F.P., $C_1 = (0,021D_2 + 0,96)$.
5. Panting stringers are not required in tugs less than 46 m in length, see Pt 4, Ch 3, 4 Panting and strengthening of bottom forward.
6. Where the frames are supported by fully effective horizontal stringers, these may be considered as decks for the purpose of determining H_{MF} .
7. Where frames are inclined at more than 15° to the vertical, H_{MF} or H_{TF} is to be measured along a chord between span points of the frame.
8. Except for main frames the modulus for these members need not exceed that derived from (1) using H_{TF} in place of S_1 .

4.5 Primary structure at sides

4.5.1 For the arrangement of primary structure in peak tanks and deep tanks forward, see also Pt 3, Ch 5, 6 Fore peak structure and Pt 3, Ch 5, 7 Forward deep tank structure.

Fore End Structure

Part 3, Chapter 5

Section 4

4.5.2 The spacing of side transverses and web frames is generally not to exceed the values given in Table 5.4.3 Spacing of side transverses and web frames forward.

Table 5.4.3: Spacing of side transverses and web frames forward

Location	Maximum spacing	
	Web frames in association with transverse framing system	Side transverses in association with longitudinal framing system
(1) Forward of the collision bulkhead	5 frame spaces	2,5 m where $L \leq 100\text{m}$ 3,5 m where $L \geq 300$ Intermediate values by interpolation
(2) In way of a forward deep tank adjacent to the collision bulkhead	5 frame spaces	3,0 m where $L \leq 100\text{m}$ 4,2 m where $L \geq 300\text{m}$ Intermediate values by interpolation
(3) Elsewhere in way of dry cargo spaces or deep tanks	See Note 1	3,8 m where $L \leq 100\text{m}$ (0,006L + 3,2) m where $L > 100\text{m}$
(4) In way of the cargo tanks of oil tankers, chemical tankers or ore or oil carriers	—	3,6 m where $L \leq 180\text{ m}$ 0,02L where $L > 180\text{ m}$
Note 1. In 'tween decks above deep tanks situated adjacent to the collision bulkhead, web frames are to be fitted in line with those in the tanks.		
Note 2. For the maximum spacing of transverses in dredgers, see Pt 4, Ch 12, 5 Shell envelope framing		

4.5.3 The scantlings of side transverses supporting longitudinal framing and stringers and webs supporting transverse framing in the forward region are to be determined from Table 5.4.4 Primary structure forward.

Table 5.4.4: Primary structure forward

Item and location	Modulus, in cm ³	Inertia, in cm ⁴
Longitudinal framing system		
(1) Side transverses in dry spaces forward of 0,2L from the F.P., see Note 5: (a) Holds (b) 'tween decks	$Z = 10kSh_{T1}l_e^2$ $Z = C_2kSTH_{TF} \sqrt{D}$	—
(2) Side transverses in peak and deep tanks forward of 0,2L from the F.P., see Notes 1 and 4: (a) where no struts fitted (b) where struts fitted	$Z = 14,1 \rho kSh_4l_e^2 \gamma$ or as (1) above, whichever is the greater As in Pt 4, Ch 9, 9 Primary members supporting longitudinal framing	$I = \frac{2,5}{k} l_e Z$
(3) Side transverses in dry spaces and deep tanks aft of 0,2L from the F.P.	As in Pt 4, Ch 1, 6 Shell envelope framing, see Notes 1 and 2	
Transverse framing system		

Fore End Structure

Part 3, Chapter 5

Section 4

(4)	Side stringers supported by webs in dry spaces forward of 0,2L from the F.P., see Note 3 or as (4) above, whichever is the greater	$Z = 7,75kSh_{T1}l_e^2$	—
(5)	Side stringers supported by webs in peak or deep tanks forward of 0,2L from the F.P., see Notes 1 and 3	$Z = 11,7\rho kSh_4l_e^2$ or as (4) above, whichever is the greater	$I = \frac{2,5}{k}l_eZ$
(6)	Web frames supporting side stringers forward of 0,2L from the F.P., see Notes 1, 2 and 3	Z to be determined from the calculations based on the following assumptions: (a) Fixed ends (b) Point loadings from stringers (c) Head γh_4 or γh_{T1} as applicable (d) Bending stress $\frac{93,2}{k}$ N/mm ² $\left(\frac{9,5}{k}$ kgf/mm ²) (e) Shear stress $\frac{83,4}{k}$ N/mm ² $\left(\frac{8,5}{k}$ kgf/mm ²)	In deep tanks $I = \frac{2,5}{k}l_eZ$
(7)	Web frames in 'tween decks, not supporting side stringers, forward of 0,2L from the F.P.	$Z = C_3kSTH_{TF}\sqrt{D}$	—
(8)	Side stringers and web frames in dry spaces and deep tanks aft of 0,2L from the F.P.	As in Pt 4, Ch 1, 6 Shell envelope framing, see Notes 1 and 2	
Symbols			
D, T, S, l _e , k, ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions			
B_f = bow fullness factor determined from Fig 5.4.3 to be taken as 1,0 for framing members located at and abaft 0,2L from the forward perpendicular			
h₄ = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading			
h_{T1} = head, in metres, at mid-length of span			
= $f_W C_W \left(1 - \frac{h_6}{D_1 - T_1}\right) F_\lambda$, in metres, where the mid-length of span is above the waterline at draught T ₁			
where $f_W \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be taken less than 0,7			
= $\left[h_6 + f_W C_W \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$, in metres, where the mid-length of span is below the waterline at draught T ₁			
where			
f_W = 1,0 at 0,2L from F.P. and 1,71 at, and forward of, 0,15L from F.P. Intermediate positions by interpolation			
h₆ = vertical distance, in metres, from the waterline at draught T ₁ to the mid-length of span			
F_λ = 1,0 for L ≤ 200 m			
= [1,0 + 0,0023 (L -200)] for L > 200 m			

C_W = a wave head, in metres

$$= 7,71 \times 10^{-2} L e^{-0,0044 L}$$

where e = base of natural logarithms 2,7183

D_1 = $T + H_b$, in metres, where H_b is defined in Pt 3, Ch 1, 6.1 Principal particulars

T_1 = T but not to be taken less than $0,65D_1$

C_2, C_3 = factors obtained from Figure 5.4.2 Framing factors for primary members

H_{TF} = vertical height of 'tween decks, in metres, as shown in Figure 5.4.

γ is to be measured at the mid-span of the member as follows:

γ_1 = 1,0 at base line

γ_2 = bow fullness factor (B_t) at $0,6D$ above base

$\gamma_3 = \left(\frac{B_f - 1}{2} \right) + 1,0$ at depth D above base

Intermediate values are to be determined by interpolation.

Minimum value = 1,0

Note 1. In way of the cargo tanks, fore peak tanks and dry spaces of oil tankers or ore carriers the scantlings of primary structure are to comply with the requirements of Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

Note 2. For bulk carriers see Pt 4, Ch 7, 6.2 Transverse stiffening.

Note 3. For stringers and webs in fore peaks or deep tanks, see also Pt 3, Ch 5, 6.3 Side structure – Transverse framing and Pt 3, Ch 5, 7.3 Side structure – Transverse framing.

Note 4. In the fore peak, the breadth S should be measured along the line of shell. The effective length l_e of the vertical webs should be measured along the line of shell from horizontal flat to horizontal flat, except that it may be taken to the underside of a transverse or strut where fitted.

Note 5. The web depth of side transverses forward of $0,2L$ from the F.P. is to be not less than 2,5 times the depth of the longitudinals supported. The web depth of stringers forward of $0,2L$ is to be not less than 2,2 times the depth of the frames supported.

Note 6. For the primary structure at sides in dredgers with restricted service notations, see Table 12.5.2 Primary supporting structure at sides.

4.5.4 The web thickness, stiffening arrangements and end connections of primary supporting members are to be in accordance with the requirements of Pt 3, Ch 10, 4 Construction details for primary members.

Conditions for ϕ

1. ϕ to be deduced at 0,025L aft of fore perpendicular
2. Aft of fore peak tank ϕ to be deduced at section being considered
3. For ships with a bulbous bow the angle ϕ is to be measured from the narrowest point of the bow between 0,6D from base and upper deck

Bow fullness factor
 $B_f = 2,45 \cos \phi \tan \theta$
 but not to be taken less than 1,0

Figure 5.4.3: Illustration of bow fullness factor determination

■ Section 5

Single and double bottom structure

5.1 General

5.1.1 For dry cargo ships exceeding 120 m in length and for all ships which have the notation 'strengthened for heavy cargoes', longitudinal framing is, in general, to be adopted (see also Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers and Pt 4, Ch 10 Single Hull Oil Tankers).

5.1.2 For ships requiring additional strengthening of bottom forward the requirements given in 1.5 are also to be complied with, as applicable.

5.1.3 For ships having the notation 'strengthened for heavy cargoes' the requirements of Pt 4, Ch 7, 8 Double bottom structure are also to be complied with, as applicable.

5.1.4 For ships intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

5.1.5 Provision is to be made for the free passage of water and/or air from all parts of single or double bottoms to bilge or tank suction, account being taken of the pumping rates required.

5.1.6 For passenger ships, see Pt 4, Ch 2, 6 Double bottom.

5.2 Single bottoms – Transverse framing

5.2.1 In fore peak spaces, for ships of full form the floors are to be supported by a centreline girder or a centreline wash bulkhead. In other cases the centreline girder is to be carried as far forward as practicable. The arrangement and scantlings of the floors and centreline girder are to be sufficient to give adequate stiffness to the structure, but are to be not less than required by Table 5.5.1 Single bottom construction forward. The floor panels and the upper edges of the floors and centreline girder are to be suitably stiffened.

Table 5.5.1: Single bottom construction forward

Item	Parameter	Requirement
Transverse framing system		
(1) Centre girder:		The greater of the following:
(a) In fore peak tank, or deep tank, forward of 0,2L from the F.P.	Modulus	$Z = 8,5 k S h d_e^2 \text{ cm}^3$, or $Z = 9,75 \rho k S h d_e^2 \text{ cm}^3$
	Inertia	$I = \frac{2,5}{k} l_e Z \text{ cm}^4$
	Web thickness	$t = t_w$ as in Pt 3, Ch 10, 4.4 Geometric properties and proportions
(b) In dry spaces	Web thickness	Forward of 0,075L from the F.P., $t = (\sqrt{Lk} + 0,5) \text{ mm}$ or 6 mm, whichever is the greater. Between 0,075L and 0,3L from the F.P. the thickness may taper from the midship thickness to the end thickness above
	Web depth and face area	As in Pt 4, Ch 1, 7 Single bottom structure
(2) Floors:		
(a) In fore peak tank, or deep tank, forward of 0,2L from the F.P.	Maximum spacing	Every frame
	Web depth (at centreline)	$d_f = (83D + 150) \text{ mm}$ or 1400 mm, whichever is the lesser
	Web thickness	$t = (6,0 + 0,025L_2) \sqrt{\frac{S_2}{800}} \text{ mm}$
	Minimum face plate area in deep tank	$A_f = 0,85kB \text{ cm}^2$
(b) In dry cargo spaces	Maximum spacing	Every frame
	Scantlings	As in Pt 4, Ch 1, 7.2 Girders and floors
(3) Intercostal side girders:		

Fore End Structure

Part 3, Chapter 5

Section 5

(a) In deep tank, forward of 0,2L from the F.P.	Maximum spacing	0,003s _F m
	Web depth	As floors
	Web thickness	$t = t_w$ as in Pt 3, Ch 10, 4.4 Geometric properties and proportions
	Minimum face plate area	Suitable stiffener
(b) In dry cargo spaces	Maximum spacing	0,003s _F m
	Scantlings	As in Pt 4, Ch 1, 7 Single bottom structure
Longitudinal framing system		
(4) Centre girder:		
(a) In deep tanks forward of 0,2L from the F.P.	Scantlings	As in Pt 4, Ch 9, 9 Primary members supporting longitudinal framing
(b) In dry spaces	Scantlings	To be specially considered
(5) Bottom transverses:		
(a) In deep tanks forward of 0,2L from the F.P., see Note 4	Maximum spacing	3,0 m for $L \leq 100$ m 4,2 m for $L \geq 300$ m Spacing at intermediate lengths by interpolation
	Scantlings	As in Pt 4, Ch 9, 9 Primary members supporting longitudinal framing
	Scantlings	To be specially considered
(b) In dry spaces	Scantlings	To be specially considered
(6) Intercostal side girders	Scantlings	To be specially considered
Symbols		
<p>L, B, D, S, l_e, k, ρ as defined in Pt 3, Ch 5, 1.4 Symbols and definitions</p> <p>h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>h_5 = distance, in metres, from mid-point of span to the following positions:</p> <p>(a) forward of 0,15L from the F.P., 3 m above the deck height obtained from Pt 3, Ch 1, 6.1 Principal particulars</p> <p>(b) at 0,2L from the F.P. the upper deck at side</p> <p>(c) between 0,15L and 0,2L from the F.P., by interpolation between (a) and (b)</p> <p>s_F = transverse frame spacing, in mm</p> <p>s_2 = spacing of stiffener, in mm, but to be taken not less than 800 mm</p> <p>L_2 = L but need not be taken greater than 215 m</p>		
<p>Note 1. For single bottom construction in way of the cargo tanks of oil tankers, see Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers and Pt 4, Ch 10 Single Hull Oil Tankers</p> <p>Note 2. For minimum thickness of structure within cargo tanks and fore peak tanks in oil tankers, see Pt 4, Ch 9, 10.2 Compartment minimum thickness and Pt 4, Ch 10, 7.2 Compartment minimum thickness.</p> <p>Note 3. For single bottom construction in dredgers, see Pt 4, Ch 12, 6 Bottom structure.</p> <p>Note 4. For ships having one or more longitudinal bulkheads the maximum spacing may be increased but is not to exceed that for the midship region.</p>		

5.2.2 In deep tanks forward of 0,2L from the F.P. floors are to be supported by a primary centreline girder or centreline bulkhead together with intercostal side girders. In the case of an oil tanker (see Pt 3, Ch 5, 1.1 Application) or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a centreline bulkhead. The arrangement and scantlings of centreline girder, floors and side girders are to be determined from Table 5.5.1 Single bottom construction forward, but in way of web frames the depth of the floor and size of the face bar are to be not less than those of the web frame. In general, floors are not to be flanged.

5.2.3 In way of dry cargo spaces forward, the arrangement and scantlings of transversely framed single bottoms are to be generally as required in the midship region as given in Pt 4, Ch 1, 7 Single bottom structure, except as required by Table 5.5.1 Single bottom construction forward. The girders forward are to scarf into the normal girder arrangement in the midship region. In ships having considerable rise of floor towards the fore end, the depth of the floors may be required to be increased or the top edge sloped upwards towards the outboard end. In general, floors are not to be flanged.

5.3 Single bottoms – Longitudinal framing

5.3.1 In deep tanks forward of 0,2L from the F.P., bottom transverses are to be supported by a primary centreline girder or a centreline bulkhead. In addition, an intercostal side girder is generally to be fitted port and starboard. In the case of an oil tanker (see Pt 3, Ch 5, 1.1 Application) or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a primary centreline support and intercostal girders. The spacing of bottom transverses and scantlings of the centreline girder, bottom transverses and side girders are to be as required by Table 5.5.1 Single bottom construction forward.

5.3.2 The requirements for longitudinally framed single bottoms in way of dry cargo spaces will be specially considered.

5.4 Double bottoms

5.4.1 The minimum depth of centre girder forward is generally to be the same as that required in the midship region by Pt 4 Ship Structures (Ship Types) for the particular type of ship concerned, but in ships with considerable rise of floor, a greater depth may be required at the fore end to provide adequate access throughout the double bottom tank.

5.4.2 Where the height of the double bottom varies, this variation is generally to be made gradual by sloping the inner bottom over an adequate longitudinal extent. Knuckles in the plating are to be arranged close to plate floors. Otherwise, suitable scarfing arrangements are to be made.

5.4.3 The arrangement and scantlings of girders, floors and inner bottom plating and the section modulus of inner bottom stiffening are to be determined from Table 5.5.2 Double bottom construction forward. In other respects the structural arrangements are to be as detailed in Pt 4 Ship Structures (Ship Types) for the particular type of ship concerned.

5.4.4 For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, see also Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

Table 5.5.2: Double bottom construction forward

Item and parameter	Requirements	
	Transverse framing	Longitudinal framing
(1) Centre girder:	$t = (0,008d_{DB} + 2)\sqrt{k} \text{ mm}$	
(a) Thickness forward of 0,075L from the F.P.		
(b) Thickness between 0,075L and 0,3L from the F.P.	As determined by a taper line from the midship thickness given in Pt 4, Ch 1, 8 Double bottom structure to the end thickness as for (1) (a)	
(2) Plate floors:		
(a) Maximum spacing forward of 0,2L from the F.P.	0,002s _F m	2,5 m
(b) Maximum spacing aft of 0,2L from the F.P.	As for midship region	As for midship region (see Note 5)
(c) Scantlings	As in Pt 4, Ch 1, 8 Double bottom structure	As in Pt 4, Ch 1, 8 Double bottom structure

Fore End Structure

Part 3, Chapter 5

Section 5

(3) Watertight floors and bracket floors	As in Pt 4, Ch 1, 8 Double bottom structure	As in Pt 4, Ch 1, 8 Double bottom structure
(4) Side girders, see Note 1: (a) Maximum spacing forward of 0,2L from the F.P. (b) Maximum spacing aft of 0,2L from the F.P. (c) Scantlings	0,003s _F m As for midship region As in Pt 4, Ch 1, 8 Double bottom structure	0,004s _L or 3,7 m whichever is the lesser As for midship region, see Note 5 As in Pt 4, Ch 1, 8 Double bottom structure
(5) Inner bottom plating, see Note 2: (a) Thickness at or forward of 0,075L from the F.P. (b) Thickness between 0,075L and 0,3L from the F.P. (c) In way of deep tanks or holds used for the carriage of water ballast or where the double bottom tank is common with a wing ballast tank.	$t = (0,00127(s + 660) \sqrt[4]{k^2LT})$ mm or 6,5 mm, whichever is the greater, see Notes 3, 4 and 5 As determined by a taper line from the midship thickness given in Pt 4, Ch 1, 8 Double bottom structure to the end thickness as for (5) (a), but not less than 6,5 mm, see Notes 3, 4 and 5 $t = (0,004 s f \sqrt{\frac{\rho k h_4}{1,025}} + 2,5)$ mm or 6,5 mm, whichever is the greater	
(6) Inner bottom longitudinals	As in Pt 4, Ch 1, 8 Double bottom structure, see Notes 2 and 5	
Symbols		
<p>L, T, S, s, = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions</p> <p>k, p</p> <p>d_{DB} = minimum depth of centre girder as required by Pt 4, Ch 1, 8 Double bottom structure</p> <p>f = $1, 1 - \frac{s}{2500S}$ but to be taken not greater than 1,0</p> <p>h₄ = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>s_F = transverse frame spacing, in mm</p> <p>s_L = spacing of bottom longitudinals, in mm</p>		
<p>Note 1. The girders forward of 0,2L are to be suitably scarfed into the midship girder arrangement.</p> <p>Note 2. For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, see also Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.</p> <p>Note 3. In way of hatches the tank top taper thickness is to be increased by 2 mm if no ceiling is fitted, but is to be taken not less than 7,5 mm.</p> <p>Note 4. Where cargo is to be regularly discharged by grabs the tank top taper thickness is to be increased by 5,0 mm if no ceiling is fitted, or by 3,0 mm where ceiling is fitted.</p> <p>Note 5. For ships having the notation 'strengthened for heavy cargoes', the requirements of Pt 4, Ch 7, 8 Double bottom structure are also to be complied with.</p>		

Section 6 Fore peak structure

6.1 General

6.1.1 The requirements given in this Section apply to the arrangement of primary structure supporting the peak side framing and bulbous bow, the arrangement and scantlings of wash bulkheads and perforated flats, and the scantlings of collision bulkheads.

6.1.2 In ships of very full form it is recommended that transverse framing and side transverses supporting longitudinal framing, together with attached floors and beams, be inclined at an angle to the centreline of ship so that the frames or transverses lie as near normal to the shell plating as possible.

6.2 Bottom structure

6.2.1 The bottom of the peak space is generally to be transversely framed with arrangements and scantlings as detailed in Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing. Longitudinally framed bottom structure will be specially considered.

6.3 Side structure – Transverse framing

6.3.1 Above the floors, transverse side framing is to be supported by one of the following arrangements:

- Side stringers spaced about 2,0 m apart and supported by struts fitted at alternate frames. The struts are to be bracketed to the frames and where the span is long, supported at the centreline by a complete or partial wash bulkhead or equally effective structure. Intermediate frames are to be bracketed to the stringer plates.
- Side stringers spaced about 2,0 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams or buttresses which should generally form a ring structure.
- Perforated flats spaced not more than 2,5 m apart. The area of perforations in each flat is to be not less than 10 per cent of the total area of the flat. The plating is to be suitably framed in way of openings.
- A combination of the above arrangements.

6.3.2 Where the depth of the peak space exceeds 10 m, a perforated flat is to be arranged at about mid-depth.

6.3.3 Where the length of the space exceeds 10 m and the side framing is supported as required by Pt 3, Ch 5, 6.3 Side structure – Transverse framing or Pt 3, Ch 5, 6.3 Side structure – Transverse framing, additional transverse strengthening in the form of transverse wash bulkheads or web frames is to be provided.

6.3.4 The scantlings of side stringers supported by struts, and also of the struts and their brackets, are to be determined from Table 5.6.1 Fore peak structure.

Table 5.6.1: Fore peak structure

Item	Parameter	Requirement
(1) Unflanged stringers supported by panting beams at alternate frames	Web thickness	$t = (6,0 + 0,025L_2)\sqrt{\frac{s_1}{600}} \text{ mm}$
	Web depth	$d_w = (400 + 3,3L)\frac{s_1}{2,0} \text{ mm}$
(2) Struts	Cross-sectional area	$A = (2,5B_1 - 0,04L_2)k \text{ cm}^2$
	Least inertia	$I = S_1S_2h_5l_e^2 \text{ cm}^4$
(3) Brackets supporting stringers and beams	Thickness	$t = (6,0 + 0,025L_2)\sqrt{\frac{s_1}{600}} \text{ mm}$
	Arm length	$l_e = \frac{150A}{t} \text{ mm in way of struts}$ $l_e = 0,5d_w \text{ mm at intermediate frames}$

Fore End Structure

Part 3, Chapter 5

Section 6

(4) Perforated flats and wash bulkheads (excluding lowest strake of plating) see Notes 1, 2 and 3	Plating thickness Stiffener modulus	$t = (6,0 + 0,015L)\sqrt{\frac{s_2}{800}} \text{ mm}$ $Z = \frac{0,0057skh_6l^2}{b} \text{ cm}^3$
(5) Diaphragms in bulbous bows and lowest strake of wash bulkhead	Plating thickness	$t = (6,0 + 0,025L_2)\sqrt{\frac{s_2}{800}} \text{ mm}$
Symbols		
<p>L, B, S, s, k = as defined in Pt 3, Ch 5, 1.4 Symbols and definitions</p> <p>b = 1,4 for rolled or built sections = 1,6 for flat bars</p> <p>h_5 = vertical distance, in metres, from the stringer to a position 3 m above the deck height obtained from Pt 3, Ch 1, 6.1 Principal particulars</p> <p>h_6 = vertical distance, in metres, from mid-depth of tank to top of tank</p> <p>l_e = effective length of stiffening member, in metres, see Table 1.9.1 Watertight and deep tank bulkhead scantlings and Table 1.9.3 Bulkhead end constraint factors in Pt 4, Ch 1</p> <p>s_1 = spacing of peak frames, in mm, but to be taken not less than 600 mm</p> <p>s_2 = spacing of stiffeners, in mm, but to be taken not less than 800 mm</p> <p>B_1 = B, but need not be taken greater than 32 m</p> <p>L_2 = L, but need not be taken greater than 215 m</p> <p>S_1 = vertical spacing or mean spacing of stringers, in metres</p> <p>S_2 = horizontal spacing of struts, in metres</p>		
Note 1. For oil tankers, see <i>also</i> Pt 4, Ch 9, 10.7 Application of stiffening requirements		
Note 2. For horizontal flats supporting vertical webs in the fore peak tank, the thickness of the flat in way of the web is to comply with Table 9.7.1 Transverse oiltight bulkhead scantlings.		
Note 3. For minimum thickness within fore peak tanks of oil tankers, see <i>also</i> Pt 4, Ch 9, 10.2 Compartment minimum thickness.		

6.3.5 The scantlings of side stringers supported by web frames, and also of the web frames, are to be determined from Pt 3, Ch 5, 4.5 Primary structure at sides.

6.3.6 The scantlings of perforated flats are to be determined from Table 5.6.1 Fore peak structure.

6.4 Side structure – Longitudinal framing

6.4.1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by Pt 3, Ch 5, 4.5 Primary structure at sides.

6.4.2 Where the depth of a tank exceeds 10 m, side transverses are generally to be supported by one or more perforated flats or an arrangement of struts.

6.4.3 Suitable transverses or deep beams are to be arranged at the top of the tank and at perforated flats to provide end rigidity to the side transverses.

6.5 Bulbous bow

6.5.1 Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.

6.5.2 At the fore end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced about 1,0 m apart in conjunction with a deep centreline web.

6.5.3 In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.

6.5.4 In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is generally to be fitted.

6.5.5 In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames spaced about five frame spaces apart are generally to be fitted.

6.5.6 The shell plating is to be increased in thickness at the fore end of the bulb and in other areas likely to be damaged by the anchors and chain cables. The increased plate thickness is to be the same as that required for plated stems by Pt 3, Ch 5, 3.3 Stem.

6.6 Wash bulkhead

6.6.1 Where a fore peak space is used as a tank and the breadth of the tank at its widest point exceeds $0,5B$, a complete or partial centreline wash bulkhead is to be fitted.

6.6.2 Wash bulkheads are to have an area of perforations not less than five per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings.

6.6.3 The scantlings of wash bulkheads are to be determined from Table 5.6.1 Fore peak structure. Stiffeners are to be bracketed at top and bottom.

6.7 Collision bulkhead

6.7.1 The position and height of the collision bulkhead are to be in accordance with the requirements of Pt 3, Ch 3, 4 Bulkhead requirements.

6.7.2 The scantlings are to comply with the requirements of Pt 4, Ch 1, 9 Bulkheads except that the thickness of plating and modulus of stiffeners are to be not less than 12 per cent greater and 25 per cent greater, respectively, than would be required for a dry space. If the collision bulkhead forms the boundary of a cargo tank or cofferdam in an oil tanker or ore carrier the minimum thickness requirements of Pt 4, Ch 9, 10 Construction details and minimum thickness are also to be complied with.

6.7.3 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the freeboard deck, see *also* Pt 5, Ch 13, 3 Drainage of compartments, other than machinery spaces. The number of openings in collision bulkheads above the freeboard deck is to be kept to a minimum compatible with the design and proper working of the ship. All such openings are to be fitted with means of closing to weathertight standards.

■ *Section 7*
Forward deep tank structure

7.1 General

7.1.1 The requirements given in this Section apply to the arrangement of primary structure supporting the side framing, the arrangement and scantlings of wash bulkheads and perforated flats, and the scantlings of boundary bulkheads in way of deep tanks situated forward of $0,2L$ from the F.P.

7.1.2 For deep tanks situated aft of this position, see Pt 4, Ch 1, 9 Bulkheads.

7.2 Bottom structure

7.2.1 The bottom structure is to comply with the requirements given in Pt 3, Ch 5, 5.2 Single bottoms – Transverse framing, Pt 3, Ch 5, 5.3 Single bottoms – Longitudinal framing and Pt 3, Ch 5, 5.4 Double bottoms, as applicable.

7.3 Side structure – Transverse framing

7.3.1 Above the floors, transverse framing is to be supported by one of the following arrangements:

- (a) Side stringers spaced not more than 5 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams or buttresses which should generally form a ring system.
- (b) Side stringers spaced not more than 5 m apart and spanning from bulkhead to bulkhead. The ends of these stringers are to be connected to horizontal stringers on the transverse bulkheads to form a ring system.
- (c) In the case of narrow tanks, perforated flats spaced not more than 5 m apart. The area of perforations is to be not less than 10 per cent of the area of the flat, and the plating is to be suitably stiffened in way of openings.

7.3.2 Where the side framing is supported as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing and the depth of the tank exceeds 16 m, the web frames are to be supported by one of the following:

- (a) One or more side stringers spanning from bulkhead to bulkhead.
- (b) One or more perforated flats having deep beams or transverses in way of the web frames.
- (c) One or more cross ties.

7.3.3 Where the side framing is supported as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing and the length of the tank exceeds 14 m, additional transverse strengthening in the form of transverse wash bulkheads or web frames is to be provided.

7.3.4 The scantlings of stringers and web frames as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing are to be determined from Pt 3, Ch 5, 4.5 Primary structure at sides.

7.3.5 The scantlings of side stringers supporting framing as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing are to be determined from Item (5) in Table 5.4.4 Primary structure forward.

7.3.6 The scantlings of side stringers supporting web frames as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing are to be determined from Item (6) in Table 5.4.4 Primary structure forward.

7.3.7 The scantlings of perforated flats as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing or Pt 3, Ch 5, 7.3 Side structure – Transverse framing are to be determined from Table 5.6.1 Fore peak structure.

7.3.8 The scantlings of cross ties are to be determined as for cross ties in the cargo tanks of oil tankers, see Pt 4, Ch 9, 9 Primary members supporting longitudinal framing. Where the span between the side shell and longitudinal bulkhead exceeds $0,3B$, additional fore and aft or vertical support for the struts may be required.

7.4 Side structure – Longitudinal framing

7.4.1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by Pt 3, Ch 5, 4.5 Primary structure at sides.

7.4.2 Where the depth of the tank exceeds 16 m, the side transverses are to be supported as required by Pt 3, Ch 5, 7.3 Side structure – Transverse framing.

7.5 Wash bulkheads

7.5.1 Where the breadth of the tank at its widest point exceeds $0,5B$, a centreline wash bulkhead is generally to be fitted. If the maximum breadth of tank exceeds $0,7B$, it is recommended that the centreline bulkhead be made intact. In the case of an oil tanker or similar ship having longitudinal bulkheads port and starboard, these may be extended to the fore end of the deep tank in lieu of a centreline bulkhead.

7.5.2 Wash bulkheads are to have an area of perforations not less than 5 per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings.

7.5.3 The scantlings of wash bulkheads are generally to be as required by Table 5.6.1 Fore peak structure, but see *also* Pt 3, Ch 5, 7.5 Wash bulkheads to Pt 3, Ch 5, 7.5 Wash bulkheads. Stiffeners are to be bracketed at top and bottom.

7.5.4 The thickness of longitudinal bulkheads may be required to be increased to ensure compliance with the shear strength requirements of Pt 3, Ch 4, 6 Hull shear strength. In the case of a centreline or perforated wing bulkhead, the proportion of the total shear force absorbed by the bulkhead will be specially considered.

7.5.5 The thickness of plating of wash bulkheads may also be required to be increased to take account of shear buckling.

7.5.6 Where longitudinal wash bulkheads support bottom transverses, the lower section of the bulkhead is to be kept free of non-essential openings for a depth equal to 1,75 times the depth of the transverses, and the plating thickness may be required to be increased to meet local buckling requirements.

7.6 Transverse boundary bulkheads

7.6.1 The transverse bulkheads forming the forward and after boundaries of the tank are generally to comply with the requirements of Pt 4, Ch 1, 9 Bulkheads, except that when the after bulkhead forms the boundary of a cargo tank or cofferdam in an oil tanker or ore carrier, the minimum thickness requirements of Pt 4, Ch 9, 10 Construction details and minimum thickness are also to be complied with.

- 7 **Sternframes and appendages**

■ *Section 1* **General**

1.1 Application

1.1.1 This Chapter applies to all types of ship covered by Pt 4 Ship Structures (Ship Types), except where specifically stated otherwise.

1.1.2 The requirements given are those specific to aft ends and relate to structure situated in the region aft of $0,3L$ from the after perpendicular.

1.1.3 Requirements for cargo space structure within this region not dealt with in this Chapter are to be as detailed in the relevant Chapter of Pt 4 Ship Structures (Ship Types) for the particular ship type.

1.1.4 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. See Pt 1, Ch 2, 2.3 Class notations (hull).

1.2 Structural configuration

1.2.1 The Rules provide for both longitudinal and transverse framing systems.

1.2.2 In the case of container ships and open type ships additional requirements may apply as detailed in Pt 4, Ch 8 Container Ships.

1.3 Structural continuity

1.3.1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes.

1.3.2 Where longitudinal framing terminates and is replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover. Where a poop is fitted extending forward of $0,15L$ from the A.P., longitudinal framing at the upper deck and topsides is generally to be continued aft of the forward bulkhead of this superstructure. In bulk carriers and oil tankers (see Pt 3, Ch 6, 1.1 Application) the longitudinal framing at the upper deck is to be maintained over the cargo space region and continued over the aft end region.

1.3.3 In oil tankers (see Pt 3, Ch 6, 1.1 Application) with machinery aft, continuity of the longitudinal bulkheads is to be maintained as far as is practicable into the machinery space, and suitable taper brackets are to be fitted at their ends.

1.3.4 In bulk carriers (see Pt 3, Ch 6, 1.1 Application) with machinery aft, continuity of the topside tank and double bottom hopper tank structure is to be maintained over the cargo space region and as far as is practicable continued into the machinery space, and suitable taper brackets are to be arranged at their ends. Also a vertical taper bracket in line with the vertical strake of the topside tank is to be fitted at the forward side of the aft bulkhead of the cargo space region. Where the topside tank and double bottom hopper tank structures terminate at the cargo space aft bulkhead, the vertical strake of the topside tank is to be arranged with an integral taper bracket and continued through the bulkhead into the machinery space for a distance of $0,2B$, and the ends of the hopper and topside structures are to be arranged with suitable taper brackets. In addition, in way of the cargo

space aft bulkhead, a girder or intercostal bulb plate stiffeners (fitted between and connected to the bulkhead vertical stiffeners), are to be arranged on the aft side in line with the sloped bulkheads of the topside and hopper tanks clear of the taper brackets.

1.3.5 In container or similar ships having continuous side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are to be continued as far aft as is practicable and are to be suitably tapered at their ends. Where, due to the ship's form, such bulkheads are stepped, suitable scarfing is to be arranged.

1.4 Symbols and definitions

1.4.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L, B, D, T = as defined in Pt 3, Ch 1, 6.1 Principal particulars

k_L, k = higher tensile steel factor as defined in Pt 3, Ch 2, 1.2 Steel

l = overall length of stiffening member, in metres, see Pt 3, Ch 3, 3.3 Determination of span point

l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3, 3.3 Determination of span point

s = spacing of secondary stiffeners, in mm

t = thickness of plating, in mm

S = spacing, or mean spacing, of primary members, in metres

Z = section modulus of stiffening member, in cm^3 , see Pt 3, Ch 3, 3.2 Geometric properties of section

ρ = relative density (specific gravity) of liquid carried in a tank and is to be taken not less than 1,025

I = inertia of stiffening member, in cm^4 , see Pt 3, Ch 3, 3.2 Geometric properties of section.

1.4.2 For the purpose of this Chapter, the after perpendicular, A.P., is defined as the after limit of the Rule length L .

■ **Section 2** **Deck structure**

2.1 General

2.1.1 Where the upper deck is longitudinally framed outside the line of openings in the midship region, this system of framing is to be carried as far aft as possible. See *also* Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers.

2.2 Deck plating

2.2.1 The thickness of strength/weather deck plating is to comply with the requirements of Table 6.2.1 Strength/weather deck plating aft (excluding poop deck).

2.2.2 The thickness of lower deck plating is to comply with the requirements of Table 6.2.2 Lower deck plating aft.

2.2.3 The taper thickness of the strength deck stringer plate is to be increased by 20 per cent at the ends of a poop or bridge where the end bulkhead is situated forward of $0,25L$ from the A.P. No increase is required where the end bulkhead lies aft of $0,2L$ from the A.P. The increase at intermediate positions is to be determined by interpolation.

2.2.4 The deck plating thickness and supporting structure are to be suitably reinforced in way of deck machinery, and in way of cranes, masts or derrick posts.

2.2.5 Where long, wide hatchways are arranged at lower decks it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

2.3 Deck stiffening

2.3.1 The scantlings of strength/weather deck longitudinals are to comply with the requirements of Table 6.2.3 Strength/weather deck longitudinals aft.

2.3.2 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements given in Table 1.4.4 Cargo and accommodation deck longitudinals.

2.3.3 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and so far as practicable, direct continuity of longitudinal strength.

2.3.4 The scantlings of weather deck beams are to comply with the midship requirements for the particular ship type.

2.3.5 The scantlings of lower deck beams are to comply with the requirements of Table 1.4.5 Strength/weather, cargo and accommodation deck beams in Pt 4, Ch 1 General Cargo Ships.

2.3.6 End connections of beams are to be in accordance with the requirements of Pt 3, Ch 10, 3 Secondary member end connections.

Aft End Structure

Part 3, Chapter 6

Section 2

Table 6.2.1: Strength/weather deck plating aft (excluding poop deck)

Symbols	Location	Thickness, in mm
L, s, S, k, p as defined in Pt 3, Ch 6, 1.4 Symbols and definitions $f = 1,1 - \frac{s}{2500S}$ but is to be taken not greater than 1,0	(1) Aft of 0,075L from the A.P.	$t = (5,5 + 0,02L)\sqrt{\frac{ks_1}{s_b}}$
h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading s_b = standard frame spacing as follows:	(2) Between 0,075L and 0,15L from the A.P.	The greater of the following: (a) $t = (5,5 + 0,02L)\sqrt{\frac{ks_1}{s_b}}$ (b) the taper thickness, see Notes 1, 2 and 3 (c) for oil tankers, the thickness is also to be in accordance with Pt 4, Ch 9, 4.3 Deck plating
Aft of 0,15L from the A.P.: $s_b = \left(510 + \frac{L}{0,6}\right)$ mm or 850 mm,	(3) Forward of 0,15L from the A.P.	The taper thickness, see Notes 1, 2 and 3, or as (2)(c) whichever is the greater
whichever is the lesser $s_1 = s$, but is to be taken not less than s_b	(4) Inside poop extending forward of 0,15L	As for a lower deck, see Note 4
	(5) In way of the crown of a tank	$t = 0,004sf\sqrt{\frac{rkh_4}{1,025}} + 3,5$ or (1) to (4) as applicable, whichever is the greater but not less than 7,5 mm where $L \geq 90$ m, or 6,5 mm where $L < 90$ m

Note 1. The taper thickness is to be determined from Table 3.2.1 Taper requirements for hull envelope in Chapter 3.

Note 2. For taper area requirements, see Table 3.2.1 Taper requirements for hull envelope in Chapter 3.

Note 3. For thickness of upper deck plating in way of the cargo tanks of oil tankers or ore carriers, see also Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers.

Note 4. The exposed weather deck taper thickness is to extend into a poop or bridge for at least one-third of the breadth of the ship from the superstructure end bulkhead.

Note 5. The taper requirements from Table 3.2.1 Taper requirements for hull envelope in Pt 3, Ch 3 Structural Design do not apply to container ships or open ship types, see Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. See also Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.

Aft End Structure

Part 3, Chapter 6

Section 2

Table 6.2.2: Lower deck plating aft

Symbols	Location	Thickness, in mm
<p>L, s, S, k, p as defined in Pt 3, Ch 6, 1.4 Symbols and definitions</p> <p>b = breadth of increased plating, in mm</p> <p>$f = 1,1 - \frac{s}{2500S}$ but is to be taken not greater than 1,0</p> <p>h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>K_2 = 2,5 mm at bottom of tank or 3,5 mm at crown of tank</p> <p>s_1 = s, but is to be taken not less than $\left(470 + \frac{L_1}{0,6}\right)$ mm</p> <p>A_f = girder face area, in cm^2</p> <p>L_1 = L, but need not be taken greater than 190 mm</p>	(1) Aft of 0,075L from the A.P.	$t = 0,01s_1\sqrt{k}$ but not less than 6,5 mm
	(2) Forward of 0,075L from the A.P., inside line of openings	$t = 0,01s_1\sqrt{k}$ but not less than 6,5 mm
	(3) Forward of 0,075L from the A.P., outside line of openings	As determined by a taper line from the midship thickness to the end thickness given by (1)
	(4) In way of the crown or bottom of a tank	$t = 0,004sf\sqrt{\frac{rkh_4}{1,025}} + K_2$ or (1), (2) or (3) as applicable, whichever is the greater but not less than 7,5 mm where $L \geq 90$ m, or 6,5 mm where $L < 90$ m
	(5) Plating forming upper flange of underdeck girders	Clear of cargo hatches $t = \sqrt{\frac{A_f}{1,8k}}$ In way of hatch side girders $t = 1,1\sqrt{\frac{A_f}{1,8k}}$ Minimum breadth $b = 760$ mm
<p>Note Where the deck loading exceeds 43,2 kN/m², (4,4 tonne-f/m²), the thickness of plating will be specially considered. This is equivalent to a 'tween deck height of 6,1 m in association with the standard stowage rate of 1,39 m³/tonne.</p>		

Table 6.2.3: Strength/weather deck longitudinals aft

Location	Modulus, in cm^3	Inertia, in cm^4
(1) Aft of 0,075L from the A.P.	The greater of the following: (a) $Z = sk(400h_1 + 0,005(l_e L_1)^2) \times 10^{-4}$ (b) $Z = 0,0074skh_1 l_e^2$	—
(2) Forward of 0,075L from the A.P., inside line of openings	As (1)	—

(3) Forward of 0,075L from the A.P., outside line of openings	As determined from Table 3.2.1 Taper requirements for hull envelope in Chapter 3, see Note 1 For oil tankers (see Pt 3, Ch 6, 1.1 Application) and dry cargo ships the end modulus for taper at 0,075L from the A.P. is to be derived from Table 5.2.3 Strength/weather deck longitudinals forward item (2)	—
(4) In way of the crown of a tank	$Z = \frac{0,0113 r s k h_4 l^2}{b} e$ or as (1) to (3) as applicable, whichever is the greater	$l = \frac{2,3}{k} l_e Z$
Symbols		
<p>L, s, k_L, k, ρ as defined in Pt 3, Ch 6, 1.4 Symbols and definitions</p> <p>$b = 1,4$ for rolled or built sections $= 1,6$ for flat bars</p> <p>$d_w =$ web depth of longitudinal, in mm</p> <p>$h_1 =$ weather head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>$h_4 =$ tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>$l_e =$ as defined in Pt 3, Ch 6, 1.4 Symbols and definitions, but is to be taken not less than 1,5 m</p> <p>$L_1 = L$ but need not be taken greater than 190 m</p>		
<p>Note 1. For taper area requirements, see Table 3.2.1 in Chapter 3.</p> <p>Note 2. Where weather decks are intended to carry deck cargo and the loading is in excess of 8,5 kN/m² (0,865 tonne-f/m²) the scantlings of longitudinals are also to comply with the requirements for location (1) in Table 1.4.4 Cargo and accommodation deck longitudinals using the equivalent design head, for specified cargo loadings, for weather decks given in Table 3.5.1 Design heads and permissible cargo loadings.</p> <p>Note 3. For the scantlings of deck longitudinals aft in way of the cargo tanks of oil tankers (see Pt 3, Ch 6, 1.1 Application) or ore carriers, see also Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers as applicable.</p> <p>Note 4. The thickness of flat bar longitudinals, situated outside the line of openings is to be not less than the following:</p> <p>Note (a) $t = \frac{d_w}{18\sqrt{k_L}}$ mm where longitudinal continuous through bulkhead</p> <p>Note (b) $t = \frac{d_w}{15\sqrt{k_L}}$ mm where longitudinal cut at bulkhead</p> <p>Note 5. The web depth of longitudinal, d_w, to be not less than 60 mm.</p> <p>Note 6. The taper requirements from Table 3.2.1 Taper requirements for hull envelope in Pt 3, Ch 3 Structural Design do not apply to container ships or open ship types, see Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. See also Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.</p>		

2.4 Deck supporting structure

2.4.1 The arrangements and scantlings of supporting structure are generally to be in accordance with the requirements given in Pt 4, Ch 1, 4 Deck structure except as required by Pt 3, Ch 6, 2.4 Deck supporting structure to Pt 3, Ch 6, 2.4 Deck supporting structure.

2.4.2 At upper and lower decks above the after peak, deep beams are generally to be fitted in way of web frames. Deck girders are generally to be spaced not more than 3,0 m apart.

2.4.3 Primary structure in the topside tanks of bulk carriers is to comply with the requirements of Pt 4, Ch 7, 7 Topside tank structure.

2.4.4 Primary structure in the cargo tanks of oil tankers, or ore carriers, is to be determined from Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.

2.5 Deck openings

2.5.1 In dry cargo ships, the requirements for deck openings given in Pt 4, Ch 1, 4 Deck structure are generally applicable throughout the aft region except that aft of 0,25L from the A.P.:

- (a) The radii or dimensions of the corners of main cargo hatchway openings of the strength deck are to be in accordance with the requirements of Pt 4, Ch 1, 4.5 Deck openings. The thickness of the insert plates, where required, is not to be less than 20 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 3 mm.
- (b) Insert plates will be required at lower decks in way of any rapid change in hull form to compensate for loss of deck cross-sectional area. Otherwise, insert plates will not normally be required.
- (c) Compensation and edge reinforcement for openings outside the line of main hatchways will be considered, bearing in mind their position, the deck arrangements and the type of ship concerned.

2.5.2 For deck openings in way of cargo tanks in oil tankers and ore carriers, see *also* Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable. For main cargo hatchway openings on bulk carriers and container ships, see *also* Pt 4, Ch 7 Bulk Carriers and Pt 4, Ch 8 Container Ships, as applicable.

■ **Section 3** **Shell envelope plating**

3.1 General

3.1.1 Where the shell is longitudinally framed in the midship region, this system of framing is to be carried as far aft as practicable.

3.2 Keel

3.2.1 The scantlings of bar keels at the aft end are to be the same as in the midship region as required by Pt 4, Ch 1, 5 Shell envelope plating.

3.2.2 The thickness and width of plate keels in the aft region are to be the same as required in the midship region for the particular type of ship concerned, see Pt 4 Ship Structures (Ship Types).

3.3 Bottom shell and bilge

3.3.1 The thickness of bottom shell and bilge plating in the aft region is to comply with the requirements of Table 6.3.1 Shell plating aft.

3.3.2 Where the bottom is transversely framed and there are large flat areas of shell plating, the buckling stability of the plating will be specially considered, and increased plate thickness or additional stiffening may be required, see *also* Pt 3, Ch 6, 5.2 Single bottoms – Transverse framing.

3.3.3 Where longitudinals are omitted in way of radiused bilge plating amidships, the plating thickness aft will be considered in relation to the support derived from the hull form and internal stiffening arrangements.

3.4 Side shell and sheerstrake

3.4.1 The thickness of side shell and sheerstrake plating in the aft region is to be not less than the values given in Table 6.3.1 Shell plating aft, but may be required to be increased locally on account of high shear forces, in accordance with Pt 3, Ch 4, 6.5 Permissible still water shear force.

3.4.2 Increased shell plate thickness may be required where the panting stringers required by Pt 3, Ch 6, 4.4 Panting stringers in way of transverse framing are omitted. The extent and amount of the increase will be specially considered.

3.4.3 The thickness of shell plating is to be increased locally in way of the sternframe, propeller brackets or rudder horn. The increased plate thickness is to be not less than 50 per cent greater than the basic shell end thickness.

3.4.4 The sheerstrake thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side, irrespective of position. Similar strengthening is to be fitted in way of the end of a poop if this occurs at a position forward of 0,25L from the A.P. No increase is required if the poop end bulkhead lies aft of 0,2L from the A.P. The increase at intermediate positions of end bulkhead is to be obtained by interpolation.

3.5 Shell openings

3.5.1 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale, or for any deck openings situated outside the line of main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

Table 6.3.1: Shell plating aft

Location	Thickness, in mm	NOTES
<p>(1) Bottom shell and bilge, see Notes 4 and 5:</p> <p>(a) Aft of 0,075L from the A.P.</p> <p>(b) Between 0,075L and 0,15L from the A.P., see Note 6</p> <p>(c) Forward of 0,15L from the A.P., see Note 6</p>	$t = (6,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}} \text{ (see Note 1)}$ <p>As (1)(a) or the taper thickness, whichever is the greater, see Note 2</p> <p>The taper thickness, see Note 2</p>	<p>Note 1. For ships where $L \leq 70$ m this thickness may be reduced by 1 mm, but it is to be not less than 6 mm.</p> <p>Note 2. The taper thickness is to be determined from Table 3.2.1 Taper requirements for hull envelope, see Note 7.</p> <p>Note 3. For thickness of shell plating in way of the cargo tanks of oil tankers or ore carriers, see also Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as applicable.</p> <p>Note 4. In offshore supply ships the thickness of side shell is to be not less than 9 mm.</p> <p>Note 5. For trawlers and fishing vessels see Pt 4, Ch 6, 5 Shell envelope plating.</p> <p>Note 6. For oil tankers the thickness is also to be in accordance with Pt 4, Ch 9, 4.3 Deck plating</p> <p>Note 7. The taper requirements from Table 3.2.1 Taper requirements for hull envelope in Pt 3, Ch 3 Structural Design do not apply to container ships or open ship types, see Pt 3, Ch 4, 2.3 Open type ships, where the requirements of Pt 4, Ch 8, 3.2 Longitudinal strength are applicable, nor to fast cargo ships where the requirements of Pt 4, Ch 1, 3 Longitudinal strength are applicable. See also Pt 3, Ch 4, 5 Hull bending strength for hull section modulus requirement away from the midship area.</p>
<p>(2) Side shell, see Notes 4 and 5:</p> <p>(a) Aft of 0,075L from the A.P.</p> <p>(b) Between 0,075L and 0,15L from the A.P., see also Pt 3, Ch 6, 3.4 Side shell and sheerstrake</p> <p>(c) Forward of 0,15L from the A.P.</p>	$t = (6,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}} \text{ (see Note 1)}$ <p>As (2)(a) or the taper thickness, whichever is the greater, see Note 2</p> <p>The taper thickness, see Note 2</p>	
<p>(3) Sheerstrake, see Notes 4 and 5</p> <p>(a) Aft of 0,075L from the A.P.:</p> <p>where $\frac{T}{D} > 0,7$</p> <p>where $\frac{T}{D} \leq 0,7$</p> <p>(b) Between 0,075L and 0,15L from the A.P., see Note 6</p> <p>(c) Forward of 0,15L from the A.P., see Note 6</p>	<p>As (2)(a) for side shell</p> <p>As (4) for a poop</p> <p>As (3)(a) or as determined from Table 3.2.1 Taper requirements for hull envelope</p> <p>The taper thickness, see Note 2</p>	
<p>(4) Poop, see Notes 4 and 5</p>	$t = (6,5 + 0,017L) \sqrt{\frac{ks_1}{s_b}}$	
Symbols		

L, B, D, T, s, k as defined in Pt 3, Ch 6, 1.4 Symbols and definitions

$s_1 = s$ but to be taken as not less than s_b

$s_b =$ standard frame spacing, in mm, as follows:

Region	Bottom shell s_b	Side shell s_b
Aft of 0,05L from the A.P.	$\left(470 + \frac{L}{0,6}\right)$ or 600*	below the deck next above the load waterline
	or $\left(470 + \frac{L}{0,6}\right)$ or 700*	above the deck next above the load waterline
Between 0,05L and 0,15L from the A.P.	$\left(510 + \frac{L}{0,6}\right)$ or 850*	

*whichever is the lesser

3.5.2 Sea inlet and other openings are to have well rounded corners and so far as possible, should be kept clear of the bilge radius. The thickness of sea inlet box plating is generally to be the same as the adjacent shell. It is not, however, to be less than 12,5 mm, and need not exceed 25 mm.

■ Section 4

Shell envelope framing

4.1 General

4.1.1 Requirements are given in this Section for both longitudinal and transverse framing systems. Where longitudinal framing is adopted in the midship region, it is to be carried as far aft as practicable.

4.1.2 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and, so far as practicable, direct continuity of longitudinal strength, see also Pt 3, Ch 10, 3 Secondary member end connections. Where L exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length.

4.1.3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and 0,8D above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations.

4.1.4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and 0,8D above the base line. Particular attention is to be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations.

4.1.5 For ships intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

4.2 Shell longitudinals

4.2.1 The scantlings of bottom and side shell longitudinals in the aft region are to comply with the requirements given in Table 6.4.1 Shell framing (longitudinal) aft.

4.3 Shell framing

4.3.1 The scantlings of side frames in the aft region are to comply with the requirements given in Table 6.4.2 Shell framing (transverse) aft.

Table 6.4.1: Shell framing (longitudinal) aft

Location	Modulus, in cm ³
(1) Side longitudinals in poop	$Z = 0,0065sk l_e^2(0,6 + 0,167D_2)$
(2) Side longitudinals in way of dry spaces including double skin construction: (a) Aft of the after peak bulkhead (b) Between the after peak bulkhead and 0,2L from the A.P. (c) Forward of 0,2L from the A.P.	$Z = 0,0085skh_{T1} l_e^2 F_s$ but not to be less than as required by (1) $Z = 0,007skh_{T1} l_e^2 F_s$ or as required in the midship region for the particular type of ship concerned, whichever is the greater As required in the midship region for the particular type of ship concerned
(3) Side longitudinals in way of double skin tanks or deep tanks	The greater of the following: (a) Z as from (2) (b) As required by Pt 4, Ch 1, 9 Bulkheads for deep tanks
(4) Bottom and bilge longitudinals	As required in the midship region for the particular type of ship concerned
Symbols	
<p>L, D, T, s, k, as defined in Pt 3, Ch 6, 1.4 Symbols and definitions</p> <p>l_e as defined in Pt 3, Ch 6, 1.4 Symbols and definitions, but is to be taken not less than 1,5m</p> <p>$D_2 = D_1$ but need not be taken greater than 20 m</p> <p>$L_1 = L$ but need not be taken greater than 190 m</p> <p>F_s is a fatigue factor to be taken as follows:</p> <p>(a) For built sections and rolled angle bars</p> $F_s = \frac{1,1}{k} \left[1 - \frac{2b_{f1}}{b_f}(1 - k) \right] \text{ at } 0,6D_1 \text{ above the base line}$ <p>= 1,0 at D_1 and above, and F_{sb} at the base line intermediate values by linear interpolation</p> <p>F_{sb} is a fatigue factor for bottom longitudinals</p> <p>= 0,5 (1 + F_s at 0,6D_1)</p> <p>(b) For flat bars and bulb plates $\frac{b_{f1}}{b_f}$ may be taken as 0,5</p> <p>where</p> <p>b_{f1} = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, see Figure 9.5.1 Definition of b_f and b_{f1}</p>	

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, see Figure 9.5.1 Definition of b_f and b_{f1}

D_1 = D but need not exceed $T_1 + H_b$, in metres, where H_b is the minimum bow height, in metres, obtained from Pt 3, Ch 1, 6.1 Principal particulars

T_1 = T but not to be taken less than $0,65D_1$

h_{T1} = $f_w C_w \left(1 - \frac{h_6}{D_1 - T_1}\right) F_\lambda$, in metres, for longitudinals above the waterline at draught T_1 where $f_w \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be less than 0,7
 = $\left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$, in metres, for longitudinals below the waterline at draught T_1

where

f_w = 1,0 at 0,2L from A.P. and 1,32 at and aft of aft peak bulkhead. Intermediate positions by interpolation.

h_6 = vertical distance, in metres, from the waterline at draught T_1 , to the longitudinal under consideration

C_w = a wave head, in metres = $7,71 \times 10^{-2} L_e^{-0,0044L}$

where

e = base of natural logarithm 2,7183

F_λ = 1,0 for $L \leq 200$ m

= $[1,0 + 0,0023 (L - 200)]$ for $L > 200$ m

Note 1. Where struts are fitted midway between transverses in double skin construction, the modulus of the side longitudinals may be reduced by 50k per cent from that obtained for locations (2) and (3) as applicable.

Note 2. For modulus and area of side longitudinals in way of a machinery space, see Pt 3, Ch 7, 3.1 Secondary stiffening.

Table 6.4.2: Shell framing (transverse) aft

Location	Modulus, in cm ³	Inertia, in cm ⁴
(1) Frames in after peak spaces and lower 'tween decks over	$Z = 1,85s k T D_2 S_1 \times 10^{-3}$	$I = \frac{3,2}{k} S_1 Z$
(2) Frames in upper 'tween decks and poops aft of the after peak bulkhead, see Notes 1, 2 and 6	The greater of the following: (a) $Z = C s k h_{T1} H^2 \times 10^{-3}$ (b) $Z = 9,1s k D_1 \times 10^{-3}$	$I = \frac{3,2}{k} H Z$
(3) Main and 'tween deck frames (including poop) between the after peak bulkhead and 0,2L from the A.P., see Notes 1, 2 and 3	The greater of the following: (a) $Z = C s k h_{T1} H^2 \times 10^{-3}$ (b) $Z = 9,1s k D_1 \times 10^{-3}$	$I = \frac{3,2}{k} H Z$
(4) Main and 'tween deck frames elsewhere, see Notes 1, 2 and 3	As required in the midship region for the particular type of ship concerned	

(5) Panting stringers, see Note 4	Web depth, d_w , same depth as frames Web thickness, $t = t_w$ as in Pt 3, Ch 10, 4.4 Geometric properties and proportions Face area, $A = k S_2 (H + 1) \text{ cm}^2$
Symbols	
<p>L, D, T, s, k as defined in Pt 3, Ch 6, 1.4 Symbols and definitions</p> <p>$D_1 = D$ but need not exceed $T + H_b$, in metres, where H_b is the minimum bow height, in metres, obtained from Pt 3, Ch 1, 6.1 Principal particulars</p> <p>$D_2 = D_1$ but is to be taken not greater than 16 m nor less than 6 m</p> <p>$H = H_{MF}$ or H_{TF} as applicable, see Note 3</p> <p>H_{MF} = vertical framing depth, in metres, of main frames as shown in Figure 6.4.1 Framing depths but is not to be taken less than 3,5 m, see Note 5</p> <p>H_{TF} = vertical framing depth, in metres, of 'tween deck frames as shown in Figure 6.4.1 Framing depths, but is not to be taken less than 2,5 m</p> <p>S_1 = vertical spacing of peak stringers or height of lower 'tween deck above the peak, in metres, as applicable</p> <p>S_2 = vertical spacing of panting stringers, in metres</p> <p>C = end connection factor</p> <p>= 3,4 where two Rule standard brackets fitted</p> <p>= 3,4 $(1,8 - 0,8 (l_a / l))$ where one Rule standard bracket and one reduced bracket fitted</p> <p>= 3,4 $(2,15 - 1,15 (l_{amean} / l))$ where two reduced brackets fitted</p> <p>= 6,1 where one Rule standard bracket fitted</p> <p>= 6,1 $(1,2 - 0,2 (l_a / l))$ where one reduced bracket fitted</p> <p>= 7,3 where no brackets fitted</p> <p>The requirements for frames where brackets larger than Rule standard are fitted will be specially considered</p> <p>l = length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets</p> <p>l_a = equivalent arm length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets</p> <p>l_{amean} = mean equivalent arm length, in mm, for both brackets</p> <p>$T_1 = T$ but not to be taken less than $0,65D_1$</p>	

h_{T1} = head, in metres, at mid-length of H

$$= f_w C_w \left(1 - \frac{h_6}{D_1 - T_1} \right) F_\lambda, \text{ in metres for frames where the mid-length of frame is above the waterline, at draught } T_1$$

$$f_w \left(1 - \frac{h_6}{D_1 - T_1} \right) \text{ is not to be taken less than } 0,7$$

$$= \left[h_6 + f_w C_w \left(1 - \frac{h_6}{2T_1} \right) \right] F_\lambda, \text{ in metres for frames where the mid-length of frame is below the waterline at draught } T_1$$

where

f_w = 1,0 at 0,2L from A.P. and 1,32 at and aft of aft peak bulkhead Intermediate positions by interpolation.

h_6 = vertical distance in metres from the waterline at draught T_1 to the mid-length of H

F_λ = 1,0 for $L \leq 200$ m

= $[1,0 + 0,0023 (L - 200)]$ for $L > 200$ m

C_w = a wave head in metres

$$= 7,71 \times 10^{-2} L e^{-0,0044 L}$$

where e = base of natural logarithm 2,7183

Note 1. In fishing vessels the modulus of main and 'tween deck frames need not be greater than 80 % of that given in (2).

Note 2. In offshore supply ships the moduli of main and 'tween deck frames are to be 25 % greater than those given in (2), (3) and (4).

Note 3. Where frames are inclined at more than 15° to the vertical, H_{MF} or H_{TF} is to be measured along a chord between span points of the frame.

Note 4. Panting stringers are not required in tugs less than 46 m in length, see Pt 4, Ch 3, 4 Panting and strengthening of bottom forward.

Note 5. Where the frames are supported by fully effective horizontal stringers, these may be considered as decks for the purpose of determining H_{MF} .

Note 6. Except for main frames the modulus for these members need not exceed that derived from (1) using H_{TF} in place of S_1 .

4.3.2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.

4.3.3 End connections of transverse main and 'tween deck frames are to be in accordance with Pt 3, Ch 10, 3 Secondary member end connections. For bulk carriers (see Pt 3, Ch 6, 1.1 Application), the end connections of main frames in cargo holds are to be in accordance with Pt 4, Ch 7, 6.2 Transverse stiffening to Pt 4, Ch 7, 6.2 Transverse stiffening.

4.4 Panting stringers in way of transverse framing

4.4.1 In deep 'tween decks above the after peak space, panting stringers having scantlings as given in Table 6.4.2 Shell framing (transverse) aft or increased shell plate thickness may be required, see also Pt 3, Ch 6, 3.4 Side shell and sheerstrake.

**Figure 6.4.1: Framing depths****Figure 6.4.2: Framing factors****4.5 Primary structure at sides**

4.5.1 Where the 'tween decks above an after peak space are transversely framed, web frames are to be fitted. Their spacing is generally not to exceed the values given in Table 6.4.3 Spacing of side transverses and web frames aft, and their scantlings are to be determined from Table 6.4.4 Primary structure aft.

4.5.2 Where longitudinal framing is arranged, the spacing of transverses is generally not to exceed the values given in Table 6.4.3 Spacing of side transverses and web frames aft, and their scantlings are to be determined from Table 6.4.4 Primary structure aft.

4.5.3 Where the shape of the after sections is such that there are large sloped flat areas, particularly in the vicinity of the propellers, additional primary supports for the secondary stiffening may be required. Their extent and scantlings will be specially considered.

Aft End Structure

Part 3, Chapter 6

Section 4

4.5.4 The web thickness, stiffening arrangements and connections of primary supporting members are to be in accordance with the requirements of Pt 3, Ch 10, 4 Construction details for primary members.

Table 6.4.3: Spacing of side transverses and web frames aft

Location	Maximum spacing	
	Web frames in association with transverse framing system	Side transverses in association with longitudinal framing system
(1) Aft of the after peak bulkhead	4 frame spaces	2,5 m where $L \leq 100$ m 3,5 m where $L \geq 300$ m Intermediate values by interpolation
(2) Elsewhere in way of dry cargo spaces or deep tanks, see Note	—	3,8 m where $L \leq 100$ m (0,006L + 3,2) m where $L > 100$ m
(3) In way of cargo tanks of oil tankers, chemical tankers or ore or oil carriers	—	3,6 m where $L \leq 180$ m 0,02L where $L > 180$ m
Note For the maximum spacing of transverses in dredgers, see Pt 4, Ch 12, 5 Shell envelope framing.		

Table 6.4.4: Primary structure aft

Item and location	Modulus, in cm ³	Inertia, in cm ⁴
Longitudinal framing system		
(1) Side transverses in dry spaces aft of the after peak bulkhead, see Note 4: (a) Lower space (b) 'Tween deck	$Z = 10 k S h_{T1} l_e^2$ $Z = C_2 k S T H_{TF} \sqrt{D}$	—
(2) Side transverses in tanks aft of the after peak bulkhead, see Note 4: (a) Lower space (b) 'Tween decks	$Z = 11,7 p k S h_4 l_e^2$ $Z = 14,1 p k S h_4 l_e^2$ or as (1) above, whichever is the greater	$I = \frac{2,5}{k} l_e Z$
(3) Side transverses in dry spaces and deep tanks forward of the after peak bulkhead	As in Pt 4, Ch 1, 6 Shell envelope framing, see Notes 1 and 2	
Transverse framing system		
(4) Side stringers supported by webs in after peak dry space, see Note 3	$Z = 7,75 k S h_{T1} l_e^2$	—
(5) Side stringers supported by webs in after peak tank, see Note 3	$Z = 11,7 p k S h_4 l_e^2$ or as (4) above, whichever is the greater	$I = \frac{2,5}{k} l_e Z$

Aft End Structure

Part 3, Chapter 6

(8) Side stringers and web frames in dry spaces and deep tanks forward of the after peak bulkhead	As in Pt 4, Ch 1, 6 Shell envelope framing, see Notes 1 and 2	
Symbols		
<p>D, T, S, l_e, k, p as defined in Pt 3, Ch 6, 1.4 Symbols and definitions</p> <p>C_2, C_3 = factors obtained from Figure 6.4.2 Framing factors</p> <p>h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>h_{T1} = head, in metres, at mid-length of span</p> <p>= $f_W C_W \left(1 - \frac{h_6}{D_1 - T_1}\right) F_\lambda$, in metres where the mid-length of span is above the waterline at draught T_1</p> <p>where $f_W \left(1 - \frac{h_6}{D_1 - T_1}\right)$ is not to be taken less than 0,7</p> <p>= $\left[h_6 + f_W C_W \left(1 - \frac{h_6}{2T_1}\right)\right] F_\lambda$, in metres where the mid-length of span is below the waterline at draught T_1</p> <p>where</p> <p>f_W = 1,0 at 0,2L from A.P. and 1,32 at and aft of aft peak bulkhead. Intermediate positions by interpolation</p> <p>h_6 = vertical distance, in metres, from the waterline at draught T_1 to the mid-length of span</p> <p>F_λ = 1,0 for $L \leq 200$ m</p> <p>= $[1,0 + 0,023 (L - 200)]$ for $L > 200$ m</p> <p>C_W = a wave head, in metres</p> <p>= $7,71 \times 10^{-2} L e^{-0,0044 L}$</p> <p>= where e=base of natural logarithms 2,7183</p> <p>D_1 = D but need not be taken greater than $T + H_b$, in metres, where H_b is the minimum bow height, in metres, obtained from Pt 3, Ch 1, 6.1 Principal particulars</p> <p>T_1 = T but not to be taken less than $0,65D_1$</p>		

H_{TF} = vertical height of 'tween decks, in metres, as shown in Figure 6.4.1 Framing depths

Note 1. In way of the cargo tanks or fuel oil tanks of oil tankers or ore carriers, the scantlings of primary structure are to comply with the requirements of Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

Note 2. For bulk carriers, see Pt 4, Ch 7, 6 Shell envelope framing

Note 3. For stringers and webs in after peaks, see also Pt 3, Ch 6, 6.2 Side structure – Transverse framing.

Note 4. The web depth of side transverses aft of the after peak bulkhead is to be not less than 2,5 times the depth of the longitudinals supported. The web depth of stringers is to be not less than 2,2 times the depth of frames supported.

Section 5

Single and double bottom structure

5.1 General

5.1.1 For dry cargo ships exceeding 120 m in length, and for all ships which are strengthened for heavy cargoes, longitudinal framing is, in general, to be adopted, see also Pt 4, Ch 9, 1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers.

5.1.2 For ships having the notation 'strengthened for heavy cargoes', the requirements of Pt 4, Ch 7, 8 Double bottom structure are also to be complied with, as applicable.

5.1.3 For ships intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

5.1.4 Provision is to be made for the free passage of water and/or air from all parts of single or double bottoms to the bilge or tank suction, account being taken of the pumping rates required.

5.1.5 For passenger ships, see Pt 4, Ch 2, 6 Double bottom.

5.2 Single bottoms – Transverse framing

5.2.1 In after peak spaces, floors are to be arranged at every frame. For details and scantlings, see Pt 3, Ch 6, 6.1 Bottom structure.

5.2.2 In way of dry cargo spaces aft, the arrangement and scantlings of transversely framed single bottoms are to be generally as required in the midship region, as given in Pt 4, Ch 1, 7 Single bottom structure, except that the thickness of the centreline girder may be tapered from the midship thickness at $0,3L$ from the A.P. to $t = (\sqrt{Lk} + 0,5)$ mm or 6 mm, whichever is the greater, at $0,075L$ from the A.P. In ships having considerable rise of floor towards the aft end, the depth of the floors may be required to be increased.

5.2.3 Where the shape of the after sections is such that there are large flat areas of shell plating, additional stiffening and/or increased shell plate thickness may be required, see Pt 3, Ch 6, 3.3 Bottom shell and bilge. The extent of this stiffening will be specially considered.

5.3 Single bottoms – Longitudinal framing

5.3.1 The scantlings and arrangement of longitudinally framed single bottoms in way of dry cargo spaces will be specially considered.

5.4 Double bottoms

5.4.1 The minimum depth of centre girder aft is generally to be the same as that required in the midship region by Pt 4 Ship Structures (Ship Types) for the particular type of ship concerned, but in ships with considerable rise of floor a greater depth may be required at the aft end to provide adequate access throughout the double bottom tank.

5.4.2 Where the height of the double bottom varies, this variation is generally to be made gradual by sloping the inner bottom over an adequate longitudinal extent. Knuckles in the plating are to be arranged close to plate floors. Otherwise, suitable scarfing arrangements are to be made.

5.4.3 For dry cargo ships, the arrangement and scantlings of girders, floors, inner bottom plating and inner bottom stiffening in the aft end region are to be determined from Pt 4, Ch 1, 8 Double bottom structure.

5.4.4 For double bottom construction in way of the cargo tanks of oil tankers or ore carriers, see also Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers or Pt 4, Ch 11 Ore Carriers, as appropriate.

■ Section 6 After peak structure

6.1 Bottom structure

6.1.1 Floors are to be arranged at every frame space and are to be carried to a suitable height, and at least to above the sterntube, where fitted. They are to have a thickness as determined from Table 6.6.1 After peak structure and are to be adequately stiffened. In way of a propeller post, rudder post or rudder horn, the floors are generally to be carried to the top of the space and are to be increased in thickness. The extent and amount of the increase will be specially considered, account being taken of the arrangements proposed.

6.2 Side structure – Transverse framing

6.2.1 Above the floors, transverse side framing is to be supported by one of the following arrangements:

- (a) Side stringers spaced not more than 2,5 m apart and supported by web frames. The upper ends of the web frames are to be supported under the tank top by suitable deep beams to form a ring structure.
- (b) Perforated flats spaced not more than 2,5 m apart. The area of perforations in each flat is to be not less than 10 per cent of the total area of the flat.
- (c) A combination of the above arrangements.

6.2.2 The scantlings of side stringers supported by web frames, and also of the web frames are to be determined from Pt 3, Ch 6, 4.5 Primary structure at sides.

6.2.3 The scantlings of perforated flats are to be determined from Table 6.6.1 After peak structure. Stiffeners are to be fitted at every frame.

6.3 Side structure – Longitudinal framing

6.3.1 The spacing and scantlings of side transverses supporting longitudinal framing are to be as required by Pt 3, Ch 6, 4.5 Primary structure at sides.

6.3.2 Suitable transverses or deep beams are to be arranged at the top of the tank to provide end rigidity to the side transverses.

Table 6.6.1: After peak structure

Item	Parameter	Requirement
(1) Floors	Thickness	$t = (7,5 + 0,025L) \sqrt{\frac{s_2}{800}} \text{ mm}$
(2) Perforated flats and wash bulkheads	Thickness see Note	$t = (7,5 + 0,015L) \sqrt{\frac{s_2}{800}} \text{ mm}$
	Stiffener modulus	$z = \frac{0,0057 skh_6 l^2}{b} \text{ cm}^3$
Symbols		
= L, s, l_0 , k as defined in Pt 3, Ch 6, 1.4 Symbols and definitions		

$b = 1,4$ for rolled or built sections

$= 1,6$ for flat bars

$h_6 =$ vertical distance from middle of effective length of stiffener to top of tank, in metres

$s_2 =$ spacing of stiffeners, in mm, but is to be taken not less than 800 mm

$L_2 = L$ but need not be taken greater than 215 m

Note The thickness for perforated flats and wash bulkheads may be reduced by 1 mm for ships of 40 m and under with no reduction for ships of 90 m and above. Reduction for intermediate lengths to be by linear interpolation.

6.4 Wash bulkheads

6.4.1 A centreline wash bulkhead is to be arranged in the upper part of the after peak space and counter or cruiser stern. Where the overhang is very large, or the breadth of the space at the widest point exceeds 20 m, additional wash bulkheads may be required port and starboard.

6.4.2 Wash bulkheads are to have an area of perforations not less than 5 per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings, and the arrangement of openings is to be such as to maintain adequate shear rigidity.

6.4.3 The scantlings of wash bulkheads are to be determined from Table 6.6.1 After peak structure, and stiffeners are to be fitted at every frame and bracketed top and bottom. The plating thickness may be required to be increased locally in way of the upper part of the sternframe or the rudder horn.

6.5 After peak bulkhead

6.5.1 The position and height of the after peak bulkhead are to be in accordance with the requirements of Pt 3, Ch 3, 4 Bulkhead requirements.

6.5.2 The scantlings of the after peak bulkhead and of the flat forming the top of the peak space are to be determined from Pt 4, Ch 1, 9 Bulkheads, but the plating thickness is to be increased locally in way of the sterntube gland.

■ **Section 7** **Sternframes and appendages**

7.1 General

7.1.1 Sternframes, rudder horns, boss end brackets and shaft brackets may be constructed of cast or forged steel, or may be fabricated from plate.

7.1.2 In castings, sudden changes of section or possible constrictions to the flow of metal during casting are to be avoided. All fillets are to have adequate radii, which should, in general, be not less than 50 to 75 mm, depending on the size of the casting.

7.1.3 Castings and forgings are to comply with the requirements of Ch 4 Steel Castings and Ch 5 Steel Forgings of the Rules for Materials respectively.

7.1.4 Cast sternframes, rudder horns, shaft brackets and solepieces are to be manufactured from special grade material. Cast bossings can be manufactured from normal grade material, see Ch 4, 2 Castings for ship and other structural applications of the Rules for Materials.

7.1.5 Sternframes, rudder horns, shaft brackets, etc. are to be effectively integrated into the ship's structure, and their design is to be such as to facilitate this.

7.2 Sternframes

7.2.1 The scantlings of sternframes are to be determined from Table 6.7.1 Sternframes. In the case of very large ships, the scantlings and arrangements may be required to be verified by direct calculations.

Table 6.7.1: Sternframes

Item	Parameter	Requirement		
(1) Propeller posts see Notes 1 and 2		Cast steel, see Figure 6.7.1 Propeller posts	Forged steel, see Figure 6.7.1 Propeller posts	Fabricated mild steel, see Figure 6.7.1 Propeller posts
	l	$165 \sqrt{T}$ mm	-	$200 \sqrt{T}$ mm
	r	$20 \sqrt{T}$ mm	-	$18 \sqrt{T}$ mm
	t_w	$8 \sqrt{T}$ mm (need not exceed 38)	need not exceed 30)	$6 \sqrt{T}$ mm
	t_1	$12 \sqrt{T}$ mm (min. 19)	-	$12 \sqrt{T}$ mm
	t_2	$16 \sqrt{T}$ mm (min.25)	-	-
	w	$115 \sqrt{T}$ mm	$40 \sqrt{T}$ mm	$140 \sqrt{T}$ mm
	A	-	$(10+0,5L)T$ cm ² where $L \leq 60$ m $40T$ cm ² where $L > 60$ m	-
(2) Propeller boss, see Note 3 and Figure 6.7.2 Propeller boss	t_b	$(0,1\delta_{TS} + 56)$ mm, but need not exceed $0,3\delta_{TS}$		

Aft End Structure

Part 3, Chapter 6

Section 7

(3) Rudder posts or axles		Single screw with integral solepiece, see Figure 6.7.6 Solepieces	Single screw with bolted rudder axle, see Figure 6.7.3 Rudder axle	Twin screw, integral with hull, see Figure 6.7.4 Rudder post for twin screw ships
		n	-	6 (see Note 4)
	r	-	-	$20 \sqrt{T}$ mm
	r_b	-	δ_A mm	-
	t_F	-	δ_B mm	-
	t_1	-	-	$12 \sqrt{T}$ mm
	t_2	-	-	$15 \sqrt{T}$ mm
	t_3	-	-	$18 \sqrt{T}$ mm
	w	-	-	$120 \sqrt{T}$ mm
	Z_{PB1}, Z_{PB2}	-	$1,2\delta_{PL2}$ mm	-
	Z_T	$0,147 \left(\frac{k_R}{0,248} \right)^3 A_{Rc2} b(V_{0+3})^2 \text{ cm}^3$	-	-
	δ_A	-	$(25T + 76)$ mm but need not exceed $0,9\delta_{PL2}$ mm	-
	δ_b	-	$6,25T + 19$ mm or $0,225\delta_{PL2}$ mm whichever is the greater	-
	$\delta_{PL1}, \delta_{PL2}$ bearing pressure and pintle clearance	-	As for rudder pintles (see Table 13.2.12 Pintle requirements in Chapter 13)	-
(4) Solepieces, see Notes 5, 6 and 7	TZ	$0,0125M_b K_o$		
	Z_v	$0,5Z_T$		
	A_s	$0,02B_1 K_o$		
Symbols				
L, T as defined in Pt 3, Ch 6, 1.4 Symbols and definitions				
a, b, c = distances, in metres, as shown in Figure 6.7.6 Solepieces				
B_1 = see Table 6.7.2 Permissible stresses for sole pieces				
c_2 = rudder profile coefficient, as given by Table 13.2.1 Rudder profile coefficient, c_2 in Chapter 13				
n = number of bolts in palm coupling				
r_b = mean distance of bolt centres from centre of palm, in mm				
t_b = finished thickness of boss, in mm				

M_B = see Table 6.7.2 Permissible stresses for sole pieces

A = cross-sectional area of forged steel propeller post, in cm^2

A_R = rudder area, in m^2

k_R = rudder coefficient, as given by Table 6.7.4 Rudder coefficient k_R

V = maximum service speed, in knots, with the ship in the loaded condition

Z_T = section modulus against transverse bending, in cm^3

Z_V = section modulus against vertical bending, in cm^3

δ_b = diameter of coupling bolts, in mm

δ_{TS} = diameter of tail shaft, in mm

K_O = as defined in Pt 3, Ch 6, 7.3 Rudder horns

A_s = sectional area, in mm^2

Note 1. Where scantlings and proportions of the propeller post differ from those shown in Item (1), the section modulus about the longitudinal axis of the proposed section normal to the post is to be equivalent to that with Rule scantlings. t is to be not less than $8\sqrt{T}$ (minimum of 19 mm for cast steel sternframes) or as required by Pt 3, Ch 6, 3.4 Side shell and sheerstrake, whichever is the greater.

Note 2. On sternframes without solepieces, the modulus of the post below the propeller boss, about the longitudinal axis may be gradually reduced to not less than 85% of that required by Note 1, subject to the same thickness limitations.

Note 3. In fabricated sternframes the connection of the propeller post to the boss is to be by full penetration welds.

Note 4. If more than six bolts are fitted, the arrangements are to provide equivalent strength.

Note 5. In fabricated solepieces, transverse webs are to be fitted spaced not more than 760 mm apart. Where the breadth of the solepiece exceeds 900 mm, a centreline vertical web is also to be fitted.

Note 6. Solepieces supporting fixed or movable nozzles will be specially considered, see Pt 3, Ch 13, 3.2 Nozzle structure.

Note 7. For dredging and reclamation craft classed 'A1 protected waters service', the scantlings of an 'open' type solepiece are to be such that:

(a) $Z_T = 0,625Z_T$

(b) The cross-sectional area is not less than 18 cm^2

(c) The depth is not less than two-thirds of the width at any point.

7.2.2 Fabricated and cast propeller posts and rudder posts of twin screw ships are to be strengthened at intervals by webs. In way of the upper part of the sternframe arch, these webs are to line up with the floors.

7.2.3 Rudder posts and propeller posts are to be connected to floors of increased thickness, see Pt 3, Ch 6, 6.1 Bottom structure.

7.2.4 The sole piece is to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 6.7.2 Permissible stresses for sole pieces.

Table 6.7.2: Permissible stresses for sole pieces

Mode	Permissible stress
(1) Equivalent stress	115/ K_0 N/mm ² (11,7/ K_0 kgf/mm ²)
Symbols	
σ_e = equivalent stress $= \sqrt{\sigma_b^2 + 3 \tau_T^2} \text{ N/mm}^2$	
σ_b = bending stress $= \frac{M_B}{Z_T} \text{ N/mm}^2$	
τ_T = shear stress $= \frac{B_1}{A_s} \text{ N/mm}^2$	
K_0 = as defined in Pt 3, Ch 6, 7.3 Rudder horns	
M_B = bending moment, in Nm, at the section considered $= B_1 x$	
B_1 = supporting force, in N, in pintle bearing $= 0,5 P_L$	
P_L = rudder force, in N, as calculated in Ch 13,2	
x = distance, in metres, from centre of rudder stock to section under consideration	
Z_T = see Table 6.7.1 Sternframes(4)	
A_s = sectional area, in mm ² , of solepiece	

7.3 Rudder horns

7.3.1 Rudder horns supporting semi-spade type rudders are to be efficiently integrated into the main hull structure, and additional web frames or side transverses may be required in the 'tween deck over.

7.3.2 The shell plating is to be increased in thickness in way of the horn. Where the horn plating is radiused into the shell plating, the radius at the shell connection is to be not less than:

$$r = (150 + 0,8L) \text{ mm}$$

7.3.3 The scantlings of the rudder horn are to be such that the section modulus against transverse bending at any section is not less than:

$$Z_T = 0,015 M_B K_0 \text{ cm}^3$$

where

$$M_B = \text{bending moment}$$

where

$$= B_{1L} z \text{ Nm}$$

B_{1L} = as calculated in Table 13.2.12 Pintle requirements

z = see Figure 6.7.7 Rudder horn

$K_o = k_o$ see Table 13.2.4 Material factor k_o for cast steel

$K_o = k = 1,0$ for fabricated mild steels

= $k = 0,78$ for high tensile steels with yield stress $\sigma_o = 315 \text{ N/mm}^2$

= $k = 0,72$ for high tensile steels with yield stress $\sigma_o = 355 \text{ N/mm}^2$.

7.3.4 The rudder horn is to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 6.7.3 Permissible stresses for rudder horns.

Table 6.7.3: Permissible stresses for rudder horns

Mode	Permissible stress
(1) Shear stress	$48/K_o \text{ N/mm}^2$ (4,9/ K_o kgf/mm ²)
(2) Equivalent stress	$120/K_o \text{ N/mm}^2$ (12/ K_o kgf/mm ²)
Symbols	
σ_e = equivalent stress σ_b = bending stress $= \frac{M_B}{Z_T} \text{ N/mm}^2$ τ = shear stress $= \frac{B_{1L}}{A_h} \text{ N/mm}^2$ τ_T = torsional stress $= \frac{10^3 M_T}{2A_T t_h} \text{ N/mm}^2$ A_h = effective shear area, in mm ² , of rudder horn in y-direction A_T = area in the horizontal section enclosed by the rudder horn, in mm ² B_{1L} = as calculated in Table 13.2.12 Pintle requirements K_o = as defined in 7.3.3 M_B = bending moment at the section considered, in Nm $= B_{1L} z$ M_T = torsional moment at the section considered, in Nm $= B_{1L} e$ t_h = plate thickness of rudder horn, in mm e = see Figure 6.7.7 Rudder horn z = see Figure 6.7.7 Rudder horn Z_T = see Pt 3, Ch 6, 7.3 Rudder horns	

Table 6.7.4: Rudder coefficient k_R

Design criteria		k_R
Ahead condition	Rudder in propeller slipstream	0,248
	Rudder out of propeller slipstream	0,235
Astern condition		0,185
Bow rudder		
Barge – non self– propelled		0,226

Table 6.7.5: Recommended propeller/hull clearances

Number of blades	Hull clearances for single screw, in metres, see Figure 6.7.8 Propeller clearances				Hull clearances for twin screw, in metres, see Figure 6.7.8 Propeller clearances

4	1,00K δ	1,50K δ	0,12 δ	0,03 δ	1,00K δ	1,20K δ
5	0,85K δ	1,275K δ	0,12 δ	0,03 δ	0,85K δ	0,85K δ
6	0,75K δ	1,125K δ	0,12 δ	0,03 δ	0,75K δ	0,75K δ
Minimum value	0,10 δ	0,15 δ	t_R	—	3 and 4 blades, 0,20 δ 5 and 6 blades, 0,16 δ	0,15 δ
Symbols						
<p>L as defined in Pt 3, Ch 6, 1.4 Symbols and definitions</p> <p>C_b = moulded block coefficient at load draught</p> $K = \left(0,1 + \frac{L}{3050} \right) \left(\frac{3,48 C_b P}{L^2} + 0,3 \right)$ $= \left(K = \left(0,1 + \frac{L}{3050} \right) \left(\frac{2,56 C_b P}{L^2} + 0,3 \right) \right)$ <p>t_R = thickness of rudder, in metres, measured at 0,7 R_P above the shaft centreline</p> <p>P = designed power on one shaft, in kW (shp)</p> <p>R_P = propeller radius, in metres</p> <p>δ = propeller diameter, in metres</p> <p>Note The above recommended minimum clearances also apply to semi-spade type rudders.</p>						

7.4 Shaft bossing

7.4.1 Where the propeller shafting is enclosed in bossings extending back to the bearings supporting the propellers, the aft end of the bossings and the bearings are to be supported by substantially constructed boss end castings or fabrications. These are to be designed to transmit the loading from the shafting efficiently into the ship's internal structure.

7.4.2 The length of the shaft bracket boss, l_b , is to be sufficient to support the length of the required bearing. In general, l_b is not to be less than $4d_t$, where d_t is the Rule diameter of the screwshaft, in mm, see Pt 5, Ch 6, 3 Design. Proposals for a reduction in the required length of the shaft bracket boss will be considered in conjunction with details of the bearing material, allowable bearing operating pressure and installation arrangements. However, in no case is l_b to be less than the greater of:

- (a) $2d_t$; or
- (b) that recommended by the bearing manufacturer; or
- (c) that required to accommodate the aftermost bearing and to allow the proper connection of the shaft bracket.

7.4.3 Where the shaft and the shaft bracket boss are of the same material, the thickness of the shaft bracket boss is not to be less than $d_t/4$. Where the shaft and the shaft bracket boss are of dissimilar materials, the thickness of the boss, t_b , is to be not less than:

$$t_b = 0,75d_t(f_1^{1/3} - 0,667) \text{ mm}$$

Note In no case is t_b to be taken as less than 12 mm

where

d_t = Rule diameter of the screwshaft in way of boss, in the appropriate screwshaft material, in mm, see Pt 5, Ch 6, 3 Design;

f_1 = s_s/s_b but not less than 0,825

s_s = ultimate tensile strength of the shaft material, in N/mm²

s_b = ultimate tensile strength of the boss material, in N/mm².

7.4.4 Cast steel supports are to be suitably radiused where they enter the main hull to line up with the boss plating radius. Where the hull sections are narrow, the two arms are generally to be connected to each other within the ship. The arms are to be strengthened at intervals by webs.

7.4.5 Fabricated supports are to be carefully designed to avoid or reduce the effect of hard spots. Continuity of the arms into the ship is to be maintained, and they are to be attached to substantial floor plates or other structure. The connection of the arms to the bearing boss is to be by full penetration welding.

7.4.6 The scantlings of supports will be specially considered. In the case of certain high powered ships, direct calculations may be required.

7.4.7 The boss plating is generally to be radiused into the shell plating and supported at the aft end by diaphragms at every frame. These diaphragms are to be suitably stiffened and connected to floors or a suitable arrangement of main and deep web frames. At the forward end, the main frames may be shaped to fit the bossing, but deep webs are generally to be fitted not more than four frame spaces apart.

7.4.8 The region where the shafting enters the ship, and the bearing in way, are to be adequately supported by floors or deep webs.

Figure 6.7.1: Propeller posts

Figure 6.7.2: Propeller boss

7.5 Shaft brackets

7.5.1 The scantlings of the arms of shaft brackets, generally based on a breadth to thickness ratio of about five, are to be determined in accordance with Pt 3, Ch 6, 7.6 Double arm shaft brackets ('A' – brackets).

7.5.2 Where the propeller shafting is exposed to the sea for some distance clear of the main hull, it is generally to be supported adjacent to the propeller by independent brackets having two arms. In very small ships, the use of single arm brackets will be specially considered.

7.5.3 Fabricated brackets are to be designed to avoid or reduce the effect of hard spots and ensure a satisfactory connection to the hull structure. The connection of the arms to the bearing boss is to be by full penetration welding.

7.5.4 Where bracket arms are carried through the shell plating, they are to be attached to floors or girders of increased thickness. The shell plating is to be increased in thickness and connected to the arms by full penetration welding.

7.5.5 In the case of certain high powered ships, direct calculations may be required and scantlings of shaft brackets will be specially considered.

7.5.6 The region where the shafting enters the ship, and the bearing in way, is to be adequately supported by floors or deep webs.

Figure 6.7.3: Rudder axle

7.6 Double arm shaft brackets ('A' – brackets)

7.6.1 The angle between the arms for double arm shaft brackets is generally to be not less than 50°. Proposals for the angle between the arms to be less than 50° will be specially considered with supporting calculations to be submitted by the designers.

7.6.2 The arms of double arm shaft brackets are to have a section modulus, Z_{xx} , of not less than that determined from the formula:

$$Z_{xx} = 0,45n^3 \text{ cm}^3$$

Where

n = the minimum thickness, in cm, of a hydrofoil section obtained from:

$$n = d_{up} \sqrt{\left(\frac{f}{2000}\right) \left(1 + \sqrt{1 + \left(\frac{0,0112}{f}\right) \left(\frac{a_d}{d_{up}}\right)^2}\right)} \text{ cm}$$

a_d = the length of the longer strut, in mm, see Figure 6.7.5 Double arm shaft bracket

d_{up} = the Rule diameter for an unprotected screwshaft, in mm, or by the applicable Ice Class Rules, see Pt 8, Ch 2, 7.8 Screwshafts, obtained from:

$$d_{up} = 128 \sqrt[3]{\frac{P}{R}}$$

P = shaft power, in kW as defined in Pt 5, Ch 1, 3.3 Power ratings

R = revolutions per minute, as defined in Pt 5, Ch 1, 3.3 Power ratings

$$f = 400 / \sigma_u$$

σ_u = ultimate tensile strength of arm material, in N/mm².

**Figure 6.7.5: Double arm shaft bracket****7.7 Propeller hull clearances**

7.7.1 Recommended minimum clearances between the propeller and the sternframe, rudder or hull are given in Table 6.7.5 Recommended propeller/hull clearances. These are the minimum distances considered desirable in order to expect reasonable levels of propeller excited vibration. Attention is drawn to the importance of the local hull form characteristics, shaft power, water flow characteristics into the propeller disc and cavitation when considering the recommended clearances.

■ *Section 1* **General**

1.1 Application

1.1.1 This Chapter applies to all ship types detailed in Pt 4 Ship Structures (Ship Types). Only requirements particular to machinery spaces, including protected machinery casings and engine seatings, are given. For other scantlings and arrangement requirements, see the relevant Chapter in Pt 4 Ship Structures (Ship Types) for the particular ship type concerned.

1.1.2 Requirements are given for machinery spaces situated as follows:

- (a) In the midship region.
- (b) In the aft end region but with a cargo compartment between it and the after peak bulkhead.
- (c) In the aft end region where the after peak bulkhead forms the aft end of the machinery space.

1.1.3 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. See Pt 1, Ch 2, 2.3 Class notations (hull).

1.2 Structural configuration

1.2.1 Requirements are given for ships constructed using either a transverse framing system or a longitudinal framing system, or a combination of the two.

1.2.2 For midship machinery spaces, where the shell and decks (outside line of openings) are longitudinally framed in way of adjacent cargo spaces, this system of framing is also to be adopted in the machinery space.

1.2.3 For machinery spaces situated aft, where the longitudinal framing terminates and is replaced by transverse framing, a suitable scarfing arrangement of the longitudinal framing is to be arranged, see also Pt 3, Ch 6, 1 General.

1.2.4 The maximum spacing, S_{\max} , of transverses in longitudinally framed machinery spaces is not to exceed the following:

- (a) where $L \leq 100$ m, $S_{\max} = 3,8$ m
- (b) where $L > 100$ m, $S_{\max} = (0,006L + 3,2)$ m

In addition, the spacing in way of a machinery space situated adjacent to the after peak is not to exceed five transverse frame spaces.

1.3 Structural continuity

1.3.1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt discontinuities where structure which contributes to the main longitudinal strength of the ship is omitted in way of a machinery space.

1.3.2 In cargo ships, suitable taper brackets are, in general, to be arranged in way of deck ends.

1.3.3 In oil tankers and bulk carriers with machinery aft (see Pt 3, Ch 6, 1.1 Application), continuity of the longitudinal bulkheads and topside tank structure is to be maintained as far as possible into the machinery space with suitable taper brackets at the end.

Machinery Spaces

Part 3, Chapter 7

Section 2

1.3.4 In container or similar ships having side tanks or double skin construction in way of the cargo spaces, the longitudinal bulkheads are generally to be carried through the machinery space where this is situated amidships or separated from the after peak by a cargo compartment. Where the machinery space is situated adjacent to the after peak, the longitudinal bulkheads are to be continued as far aft as possible and suitably tapered at their ends.

1.4 Symbols and definitions

1.4.1 For symbols not defined in this Chapter, see Pt 4, Ch 1 General Cargo Ships. L , B , D and T are defined in Pt 3, Ch 1, 6.1 Principal particulars. Other symbols are defined in the appropriate Sections.

■ Section 2 Deck structure

2.1 Strength deck – Plating

2.1.1 The corners of machinery space openings are to be of suitable shape and design to minimise stress concentrations.

2.1.2 In the case of oil tankers (see Pt 3, Ch 6, 1.1 Application), or other ships having small deck openings amidships and machinery aft, where the width of machinery openings exceeds $\frac{B}{2}$ and the opening extends forward beyond a point $\frac{B}{3}$ aft of the poop front, the thickness of deck plating may be required to be increased locally.

2.2 Strength deck – Primary structure

2.2.1 Where a transverse framing system is adopted, deck beams are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Deep beams are to be arranged in way of the ends of engine casings and also in line with web frames where fitted.

2.2.2 Where a longitudinal framing system is adopted, deck longitudinals are to be supported by transverses in association with pillars or pillar bulkheads. For the maximum spacing of transverses, see Pt 3, Ch 7, 1.2 Structural configuration. Deck transverses are to be in line with side transverses or web frames.

2.2.3 Machinery casings are to be supported by a suitable arrangement of deep beams or transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required, and these are to be arranged in line with deep beams or transverses.

2.3 Lower decks

2.3.1 The scantlings of lower decks or flats are generally to be as detailed in Pt 3, Ch 5, 2 Deck structure, Pt 3, Ch 6, 2 Deck structure or Pt 4, Ch 1, 4 Deck structure, as appropriate. However, in way of concentrated loads such as those from boiler bearers or heavy auxiliary machinery, etc. the scantlings of deck structure will be specially considered, taking account of the actual loading.

2.3.2 In way of machinery openings, etc. particularly towards the aft end, decks or flats are to have sufficient strength where they are intended as effective supports for side framing, webs or transverses. Web frames and side transverses are to be supported by deep beams or deck transverses.

■ Section 3 Side shell structure

3.1 Secondary stiffening

3.1.1 Transverse frames are generally to have scantlings determined as required by Pt 4, Ch 1, 6 Shell envelope framing for cargo spaces, except that where, in a machinery space situated in the midship region, it is desired to omit web frames as permitted by Pt 3, Ch 7, 3.2 Primary structure – Transverse framing, the section modulus of the ordinary main or 'tween deck frames is to be increased by 50 per cent, up to the level of the lowest deck above the load waterline. Where fully effective stringers

supported by web frames are fitted, the stringers may be considered as decks for the purpose of calculating the modulus of the frames.

3.1.2 Longitudinal framing is generally to have scantlings determined as required by Pt 4, Ch 1, 6 Shell envelope framing for machinery spaces in the midship region, and by Table 6.4.1 Shell framing (longitudinal) aft Location 2(b) in Chapter 6 for machinery spaces clear of and aft of the midship region.

3.2 Primary structure – Transverse framing

3.2.1 Where the space is situated in the aft end region, web frames are to be fitted, spaced in general not more than five frame spaces apart, extending from the tank top to the upper deck and having scantlings as required by Table 7.3.1 Primary structure in machinery spaces. However, consideration will be given to a spacing of web frames at not more than seven transverse frame spaces apart, in association with substantially increased ordinary frames to satisfy the overall modulus and inertia requirements. The web frames are to be connected at top and bottom to members of adequate stiffness and supported at lower decks by deep beams. If the span of ordinary frames below the lowest deck or flat exceeds 6,5 m, one or more fully effective side stringers are to be fitted to support the frames. These are to have scantlings as required by Table 7.3.1 Primary structure in machinery spaces. Stringers are to be efficiently bracketed to bulkheads, and their connection to the web frames is to be such as to provide adequate continuity of face material.

3.2.2 As an alternative to the fully effective stringers required by Pt 3, Ch 7, 3.2 Primary structure – Transverse framing, an arrangement of light stringers spaced about 2,5 m apart may be accepted. These stringers are to have scantlings not less than those required in the panting region forward, see Pt 3, Ch 5, 4.4 Panting stringers in way of transverse framing.

3.2.3 Where the machinery space is situated in the midship region, it is recommended that web frames be fitted in the engine-room, spaced not more than five frame spaces apart and extending from the tank top to the level of the lowest deck above the load waterline. The scantlings of these webs are to be such that the combined section modulus of the web frame and the main or 'tween deck frames is 50 per cent greater than that required for normal transverse framing. These webs may be omitted if the section modulus of the transverse frames is increased as required by Pt 3, Ch 7, 3.1 Secondary stiffening.

3.2.4 If an effective side stringer supporting the side frames is fitted, then its scantlings and those of the supporting web frames are to be determined from Table 7.3.1 Primary structure in machinery spaces.

3.3 Primary structure – Longitudinal framing

3.3.1 Where the machinery space is longitudinally framed, side transverses are to be fitted having scantlings as required by Table 7.3.1 Primary structure in machinery spaces. For the maximum spacing of transverses, see Pt 3, Ch 7, 1.2 Structural configuration. Transverses are to be connected at top and bottom to members of adequate stiffness and supported at lower decks by transverses or deep beams.

Machinery Spaces

Part 3, Chapter 7

Section 4

Table 7.3.1: Primary structure in machinery spaces

Symbols	Item and position	Scantlings	
		Section modulus, in cm ³	Min. web depth d_w , in mm
<p>L, D and T are as defined in Pt 3, Ch 1, 6.1 Principal particulars</p> <p>h = load head, in metres, measured from mid-point of span to upper deck at side amidships</p> <p>k = higher tensile and steel factor, see Pt 3, Ch 2, 1.2 Steel</p> <p>l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3, 3.3 Determination of span point</p> <p>s = spacing of floors and longitudinals, in mm</p> <p>C = 2,2 for a lower 'tween deck or 2,0 for an upper 'tween deck</p> <p>S = spacing or mean spacing of primary supporting members, in metres</p>	TRANSVERSE FRAMING SYSTEM		
	Aft end region:		
	Web frames below lowest deck and not supporting effective stringers	$Z = 5kShl_e^2$	2,5 × depth of adjacent main frames
	Web frames above lowest deck	$Z = 1,68CkTSl_e\sqrt{D}$	
	Any region:	$Z = 7,75kShl_e^2$	2,5 × depth of adjacent main frames
	Fully effective stringers		
	Web frames below lowest deck supporting effective stringers	Determined from calculation based on following assumptions: (a) Fixed ends (b) Point loadings (c) Head to upper deck at side (d) Bending stress 93,2 N/mm ² (9,5 kgf/mm ²) (e) Shear stress 83,4 N/mm ² (8,5 kgf/mm ²)	
	LONGITUDINAL FRAMING SYSTEM		
	Side transverses below lowest deck	$Z = 10kShl_e^2$	2,5 × depth of longitudinals
	Side transverses above lowest deck	$Z = 2,1CkTSl_e\sqrt{D}$	

Section 4

Double and single bottom structure

4.1 Double bottom structure

4.1.1 The minimum depth of the centre girder and its thickness are to be at least the same as required in way of cargo space amidships, see Pt 4, Ch 1, 8 Double bottom structure. A greater depth is recommended in way of large engine-rooms when the variation in draught between light and load conditions is considerable. For passenger ships, see Pt 4, Ch 2, 6 Double bottom.

4.1.2 In machinery spaces situated adjacent to the after peak, the double bottom is to be transversely framed. Elsewhere transverse or longitudinal framing may be adopted, but see also Pt 4, Ch 1, 8 Double bottom structure.

4.1.3 Where the double bottom is transversely framed, plate floors are to be fitted at every frame in the engine-room. In way of boilers, plate floors are to be fitted under the boiler bearers, and elsewhere as required by Pt 4, Ch 1, 8 Double bottom structure.

4.1.4 Where the double bottom is longitudinally framed, plate floors are to be fitted at every frame under the main engines and thrust bearing. Outboard of the engine seating, floors may be fitted at alternate frames, see Figure 7.4.1 Engine-room with longitudinal framing.

4.1.5 The scantlings of floors clear of the main engine seatings, are generally to be as required in way of cargo spaces, see Pt 4, Ch 1, 8 Double bottom structure. In way of engine seatings, the floors are to be increased in thickness, see Pt 3, Ch 7, 6.2 Seats for oil engines.

4.1.6 Sufficient fore and aft girders are to be arranged in way of the main machinery to effectively distribute its weight and to ensure adequate rigidity of the structure. In midship machinery spaces these girders are to extend for the full length of the space and are to be carried aft to support the foremost shaft tunnel bearing. This extension beyond the after bulkhead of the engine-room is to be for at least three transverse frame spaces, aft of which the girders are to scarf into the structure. Forward of the engine-room bulkhead, the girders are to be tapered off over three frame spaces and effectively scarfed into the structure. In machinery spaces situated at the aft end the girders are to be carried as far aft as practicable and the ends effectively supported by web frames or transverses. For recommended scantlings of engine girders, see Pt 3, Ch 7, 6.2 Seats for oil engines.

4.1.7 Outboard of the engines, side girders are to be arranged, where practicable, to line up with the side girders in adjacent cargo spaces. These are to have scantlings as required by Pt 4, Ch 1, 8 Double bottom structure.

4.1.8 Where the double bottom is longitudinally framed and transverse floors are fitted in way of the engine seatings as required by Pt 3, Ch 7, 4.1 Double bottom structure, no additional longitudinal stiffening is required in way of the engines other than the main engine girders, provided that the spacing of girders does not exceed 1,5 times the normal spacing of longitudinals. Where this spacing of girders is exceeded, shell longitudinals are to be fitted. These are to scarf into the longitudinal framing clear of the machinery spaces. The scantlings of the longitudinals are to be determined as required by Pt 4, Ch 1, 6 Shell envelope framing using a minimum span of 1,3 m, see Figure 7.4.1 Engine-room with longitudinal framing.

4.1.9 The thickness, t , of inner bottom plating in engine-rooms, clear of the engine seatings, is to be not less than:

$$t = 0,0015 \sqrt[4]{L T k^2 (s + 660)} \text{ mm}$$

and not less than 7,0 mm (symbols as defined in Table 7.3.1 Primary structure in machinery spaces). This thickness will be required to be increased in way of engine seatings integral with the tank top, see Pt 3, Ch 7, 6.2 Seats for oil engines.

4.1.10 Where the height of inner bottom in the machinery spaces differs from that in adjacent spaces, continuity of longitudinal material is to be maintained by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the plating are to be arranged close to plate floors.

4.2 Single bottom structure

4.2.1 In way of machinery spaces situated amidships the minimum depth of floors is to be at least 10 per cent greater than that required elsewhere in general cargo ships, see Pt 4, Ch 1, 7 Single bottom structure. If the top of the floors is recessed in way of the engines, the depth of the floors in way of the recess should generally be not less than that required by Pt 4, Ch 1, 7 Single bottom structure, but this will be specially considered in each case in relation to the arrangements proposed.

4.2.2 In way of machinery spaces situated aft, or where there is considerable rise of floor, the depth of the floors will be specially considered.

4.2.3 Clear of the engine seatings the thickness and face plate area of the floor webs are to be 1,0 mm and 10 per cent greater, respectively, than the requirements for general cargo ships as given in Pt 4, Ch 1, 7 Single bottom structure. The floors are not to be flanged.

4.2.4 Sufficient fore and aft girders are to be arranged in way of machinery to effectively distribute its weight and ensure adequate rigidity of the structure. In midship machinery spaces these girders are to extend for the full length of the space and are to be carried aft to support the foremost shaft tunnel bearing and forward to scarf into the structure. In machinery spaces situated at the aft end, the girders are to be carried as far aft as practicable and the ends effectively supported by web frames or transverses. For scantlings of engine girders, see Pt 3, Ch 7, 6.2 Seats for oil engines.

4.2.5 Outboard of the engines, side girders are to be arranged having scantlings as required by Pt 4, Ch 1, 7 Single bottom structure and these are to be scarfed into the side girders in adjacent spaces.

■ Section 5

Machinery casings and fuel oil bunkers

5.1 Machinery casings

5.1.1 The scantlings and arrangements of exposed casings protecting machinery openings are to be in accordance with Pt 3, Ch 8, 2 Scantlings of erections other than forecastles.

5.1.2 The minimum scantlings of protected casings are to be in accordance with Table 7.5.1 Protected machinery casings.

Table 7.5.1: Protected machinery casings

Item	Minimum scantlings
Plating:	
In way of cargo hold spaces	$t = 6,5\sqrt{k}$ mm
In way of accommodation spaces	$t = 5,0\sqrt{k}$ mm
Stiffeners	$Z = 0,008l_e s k$ cm ³
Symbols	
k = higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel	
l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3, 3.3 Determination of span point	
s = spacing of stiffeners, in mm	
t = thickness, in mm	
Z = section modulus of stiffening member, in cm ³ , see Pt 3, Ch 3, 3.2 Geometric properties of section	
Note In no case is the depth of the stiffener to be less than 60 mm.	

5.1.3 Where casing stiffeners carry loads from deck transverses, girders, etc. or where they are in line with pillars below, they are to be suitably increased, see also Pt 4, Ch 1, 4 Deck structure.

5.1.4 Where casing sides act as girders supporting decks over, care is to be taken that access openings do not seriously weaken the structure. Openings are to be effectively framed and reinforced if found necessary. Particular attention is to be paid to stiffening where the casing supports the funnel or exhaust uptakes.

5.2 Fuel oil bunkers

5.2.1 Fuel oil bunkers situated within the machinery space are generally to comply with the requirements given in Pt 4, Ch 1 General Cargo Ships or Pt 3, Ch 9 Special Features, as appropriate.

■ **Section 6** **Engine seatings**

6.1 General

6.1.1 Main engines and thrust bearings are to be effectively secured to the hull structure by seatings of adequate scantlings to resist the various gravitational, thrust, torque, dynamic and vibratory forces which may be imposed on them.

6.1.2 For initial guidance, recommended scantlings for oil engine seatings are given in Pt 3, Ch 7, 6.2 Seats for oil engines.

6.1.3 In the case of higher power oil engines or turbine installations the seatings should generally be integral with the double bottom structure. The tank top plating in way of the engine foundation plate or the turbine gear case and the thrust bearing should be substantially increased in thickness, see Figure 7.6.1 Engine seatings, Type 1.

6.1.4 If the main machinery is supported on seatings of Type 2 as shown in Figure 7.6.1 Engine seatings, these are to be so designed that they distribute the forces from the engine as uniformly as possible into the supporting structure. Longitudinal members supporting the seating are to be arranged in line with girders in the double bottom, and adequate transverse stiffening is to be arranged in line with floors, see Figure 7.6.1 Engine seatings, Type 2.

6.1.5 In ships having open floors in the machinery space the seatings are generally to be arranged above the level of the top of floors and securely bracketed to them, see Figure 7.6.1 Engine seatings, Type 3.

6.2 Seats for oil engines

6.2.1 In determining the scantlings of seats for oil engines, consideration is to be given to the general rigidity of the engine itself and to its design characteristics in regard to out of balance forces. As a general guide to designers, recommended scantlings are given in Table 7.6.1 Seats for oil engines - Recommended scantlings.

NOTE: Floors not to be flanged, see Note

Note See Pt 3, Ch 7, 4.2 Single bottom structure

Symbols	Item	Scantlings of one seat
<p>L as defined in Pt 3, Ch 1, 6.1 Principal particulars</p> <p>f = engine factor = $\frac{P}{RI}$</p> <p>t = minimum thickness of top plate, in mm</p>	Top plate	$A = (120 + 44,2f + 4,07f^2) \text{ cm}^2$ $(A = (120 + 32,5f + 2,2f^2) \text{ cm}^2)$
<p>t_1, t_2 = main engine girder thicknesses, in mm</p> <p>t_3 = floor plate thickness under seating, in mm, see also Figure 7.6.1 Engine seatings</p> <p>A = area of top plate for one side of seat, in cm^2</p>		<p>Minimum thickness:</p> <p>(a) Where two girders fitted</p> <p>$t = (19 + 3,4f) \text{ mm}$ $(t = (19 + 2,5f) \text{ mm})$</p> <p>(b) Where one girder fitted</p> <p>$t = (25 + 3,4f) \text{ mm}$ $(t = (25 + 2,5f) \text{ mm})$</p>
	Girders (both inside and above double bottom where fitted)	Number:
<p>where</p> <p>l = effective length of engine foundation plate, in metres, required for bolting the engine to the seating.</p> <p>= The thrust and gearcase seating is to be considered as a separate item</p> <p>P = power of one engine at maximum service speed, in kW (bhp)</p>		<p>Generally two but a single girder can be accepted where all the following apply:</p> <p>(a) $f < 1,84$ (2,5)</p> <p>(b) $P < 5900 \text{ kW}$ (8000 bhp)</p> <p>(c) $L < 100 \text{ m}$</p>
<p>R = rev/min of engine at maximum service speed</p>		<p>Total thickness:</p> <p>(a) Where two girders are fitted</p> <p>$t_1 + t_2 = (28 + 4,08f) \text{ mm}$ $(t_1 + t_2 = (28 + 3,0f) \text{ mm})$</p> <p>(b) Where one girder is fitted</p> <p>$t_1 = (15 + 4,08f) \text{ mm}$ $(t_1 = (15 + 3,0f) \text{ mm})$</p>
	Floors (between girders or under seat where a single girder is fitted)	<p>Thickness:</p> <p>$t_3 = (10 + 1,5f) \text{ mm}$ $(t_3 = (10 + 1,1f) \text{ mm})$</p>

6.3 Seats for turbines

6.3.1 Seats are to be so designed as to provide effective support for the turbines and ensure their proper alignment with the gearing, and (where applicable) allow for thermal expansion of the casings. In general, the seats are not to be arranged in way of breaks or recesses in the double bottom.

6.4 Seats for boilers

6.4.1 Boiler bearers are to be of substantial construction and efficiently supported by transverse and horizontal brackets. These should generally be arranged in line with plate floors and girders in a double bottom or with suitable deep beams or transverses and girders at boiler flats. Suitable allowance is to be made in the design of the supporting structure for the variation in loading due to thermal expansion effects, see *also* Pt 5, Ch 14, 2 Fuel oil - General requirements.

6.5 Seats for auxiliary machinery

6.5.1 Auxiliary machinery is to be secured on seatings, of adequate scantlings, so arranged as to distribute the loadings evenly into the supporting structure.

Section

- 3 **Aluminium erections**
- 4 **Forecastles**
- 5 **Bulwarks, guard rails and other means for the protection of crew**

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to all types of ships detailed in Pt 4 Ship Structures (Ship Types), except for deckhouses situated on forecastles of offshore supply ships, which are dealt with separately in Pt 4, Ch 4 Offshore Support Vessels.

1.1.2 The scantlings of exposed bulkheads and decks of superstructures and deckhouses are generally to comply with the following requirements, but increased scantlings may be required where the structure is subjected to loading additional to Rule. Where there is no access from inside the house to below the freeboard deck, or where a bulkhead is in a particularly sheltered location, the scantlings may be specially considered.

1.1.3 The term 'erection' is used in this Section to include both superstructures and deckhouses.

1.1.4 For requirements relating to companionways, doors, accesses and skylights, see Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads.

1.1.5 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. See Pt 1, Ch 2, 2.3 Class notations (hull).

1.2 Symbols

1.2.1 The following symbols and definitions are applicable to this Chapter, unless otherwise stated:

L, B, T = as defined in Pt 3, Ch 1, 6.1 Principal particulars
and C_b

b = breadth of deckhouse, at the positions under consideration, in metres

k = higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel

l_e = effective length, in metres, of the stiffening member, deck beam or longitudinal measured between span points, see Pt 3, Ch 3, 3.3 Determination of span point

l_s = span, in metres, of stiffeners, and is to be taken as the 'tween deck or house height but in no case as less than 2,0 m

s = spacing of stiffeners, beams or longitudinals, in mm

s_b = standard spacing, in mm, of stiffeners, beams or longitudinals, and is to be taken as:

= (a) for 0,05L from the ends:

= $s_b = 610$ mm or that required by (b), whichever is the lesser

= (b) elsewhere:

= $s_b = 470 + 1,67L_2$ mm

= but forward of $0,2L$ from the forward perpendicular s_b is not to exceed 700 mm

B_1 = actual breadth of ship, at the section under consideration, measured at the weather deck, in metres

D = moulded depth of ship, in metres, to the uppermost continuous deck or the deck next above a height of 1,67 from the base line amidships, whichever is the lesser

L_2 = length of ship, in metres, but is not to be taken greater than 250 m or less than 50 m

L_3 = length of ship, in metres, but is not to be taken greater than 300 m

X = distance, in metres, between the after perpendicular and the bulkhead under consideration. When determining the scantlings of deckhouse sides, the deckhouse is to be subdivided into parts of approximately equal length not exceeding $0,15L$ each, and X is to be measured to the mid-length of each part

α = a coefficient given in Table 8.1.1 Values of α

$$\beta = 1,0 + \left(\frac{\left(\frac{X}{L} - 0,45 \right)}{(C_b + 0,2)} \right)^2 \text{ for } \frac{X}{L} \leq 0,45$$

$$= 1,0 + 1,5 \left(\frac{\left(\frac{X}{L} - 0,45 \right)}{(C_b + 0,2)} \right)^2 \text{ for } \frac{X}{L} > 0,45$$

= C_b is to be taken as not less than 0,6 nor greater than 0,8. Where the aft end of an erection is forward of amidships, the value of C_b used in determining β for the aft end bulkhead need be taken as not less than 0,8

γ = vertical distance, in metres, from the summer load waterline to the mid-point of span of the bulkhead stiffener, or the mid-point of the plate panel, as appropriate

δ = 1,0 for exposed machinery casings and houses protecting openings to pump-rooms

= $\left(0,3 + 0,7 \frac{b}{B_1} \right)$ elsewhere, but in no case to be taken less than 0,475

λ = a coefficient given in Table 8.1.2 Values of λ .

1.3 Definition of tiers

1.3.1 The lowest, or first tier, is normally that which is directly situated on the deck to which D is measured. The second tier is the next tier above the lowest tier and so on.

Table 8.1.1: Values of α

Position			α
Lowest tier	-	unprotected front	$2,0 + 0,0083L_3$
Second tier	-	unprotected front	$1,0 + 0,0083L_3$
Third tier and above	-	unprotected front	$0,5 + 0,0067L_3$
All tiers	-	protected fronts	
All tiers	-	sides	
All tiers	-	aft end where aft of amidships	$0,7 + 0,001L_3 - 0,8 \frac{X}{L}$
All tiers	-	aft end where forward of amidships	$0,5 + 0,001L_3 - 0,4 \frac{X}{L}$

Table 8.1.2: Values of λ

Length L	λ	Expression for λ
metres		
20	0,89

$$L \leq 150 \text{ m}$$

$$\lambda = \left(\frac{L}{10} e^{-\frac{L}{300}} \right) - \left(1 - \left(\frac{L}{150} \right)^2 \right)$$

$$150 \text{ m} \leq L \leq 300 \text{ m} \quad \lambda = \frac{L}{10} e^{-\frac{L}{300}}$$

$$L \geq 300 \text{ m}$$

$$\lambda = 11,03$$

1.3.2 Where the freeboard corresponding to the required summer moulded draught for the ship can be obtained by considering the ship to have a virtual moulded depth at least one standard superstructure height less than the Rule depth, D , measured to the uppermost continuous deck, proposals to treat the first tier erection as a second tier, and so on, will be specially considered. The standard height of superstructure is the height defined in the *International Convention on Load Lines, 1966*.

1.4 Design pressure head

1.4.1 The design pressure head, h , to be used in the determination of erection scantlings is to be taken as:

$$h = \alpha \delta (\beta \lambda - \gamma) \text{ m}$$

1.4.2 In no case is the design pressure head to be taken as less than the following:

(a) Lowest tier of unprotected fronts:

$$\text{minimum } h = 2,5 + 0,01L_2 \text{ m}$$

(b) All other locations:

$$\text{minimum } h = 1,25 + 0,005L_2 \text{ m.}$$

■ Section 2

Scantlings of erections other than forecastles

2.1 Thickness of bulkhead and side plating

2.1.1 The thickness, t , of plating of the fronts, sides and aft ends of all erections, other than the sides of superstructures where these are an extension of the side shell, is to be not less than:

$$t = 0,003s\sqrt{kh} \text{ mm}$$

but in no case is the thickness to be less than:

(a) for the lowest tier:

$$t = (5,0 + 0,01L_3)\sqrt{k} \text{ mm}$$

(b) for the upper tiers:

$$t = (4,0 + 0,01L_3)\sqrt{k} \text{ mm but not less than 5,0 mm}$$

2.1.2 The thickness of sides of poops and bridges is to be as required by Pt 3, Ch 6, 3 Shell envelope plating or Pt 4, Ch 1, 5 Shell envelope plating, as appropriate.

2.2 Stiffeners and their connections

2.2.1 The modulus of stiffeners, Z , on front, side and end bulkheads of all erections, other than sides of superstructures, is to be not less than:

$$Z = 0,0035hs l_s^2 k \text{ cm}^3$$

2.2.2 The section modulus of side frames of poops and bridges is to comply with the requirements of Pt 3, Ch 6, 4 Shell envelope framing or Pt 4, Ch 1, 6 Shell envelope framing, as appropriate.

2.2.3 The end connections of stiffeners are to be as given in Table 8.2.1 Stiffener end connections.

2.3 Deck plating

2.3.1 The thickness of erection deck plating is to be not less than that required by Table 8.2.2 Thickness of deck plating.

2.3.2 When decks are fitted with approved sheathing, the thicknesses derived from Table 8.2.2 Thickness of deck plating may be reduced by 10 per cent for a 50 mm sheathing thickness, or 5 per cent for 25,5 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck, see also Pt 6, Ch 4 Fire Protection, Detection and Extinction Requirements. Inside deckhouses the thickness may be reduced by a further 10 per cent.

Table 8.2.1: Stiffener end connections

Position		Attachment at top and bottom
1.	Front stiffeners of lower tiers and of upper tiers when L is 160 m or greater	See Pt 3, Ch 10 Welding and Structural Details
2.	Front stiffeners of upper tiers when L is less than 160 m	May be unattached
3.	Side stiffeners of lower tiers where two or more tiers are fitted	Bracketed, unless stiffener modulus is increased by 20 per cent and ends are welded to the deck all round
4.	Side stiffeners if only one tier is fitted, and aft end stiffeners of after deckhouses on deck to which D is measured	See Pt 3, Ch 10 Welding and Structural Details
5.	Side stiffeners of upper tiers when L is 160 m or greater	See Pt 3, Ch 10 Welding and Structural Details
6.	Side stiffeners of upper tiers when L is less than 160 m	May be unattached

7.	Aft end stiffeners except as covered by item 4	May be unattached
8.	Exposed machinery and pump-room casings -Front stiffeners on amidship casings and all stiffeners on aft end casings which are situated on the deck to which D is measured	Bracketed
9.	All other stiffeners on exposed machinery and pump-room casings	6,5 cm ² of weld

Table 8.2.2: Thickness of deck plating

Position	Thickness of deck plating, in mm	
	$L \leq 100$ m	$L > 100$ m
Top of first tier erection	$(5,5 + 0,02L)\sqrt{\frac{ks}{s_b}}$	$7,5\sqrt{\frac{ks}{s_b}}$
Top of second tier erection	$(5,0 + 0,02L)\sqrt{\frac{ks}{s_b}}$	$7,0\sqrt{\frac{ks}{s_b}}$
Top of third tier and above	$(4,5 + 0,02L)\sqrt{\frac{ks}{s_b}}$ but not less than 5,0 mm	$6,5\sqrt{\frac{ks}{s_b}}$

2.4 Deck longitudinals and beams

2.4.1 The section modulus of superstructure deck longitudinals and beams is to be in accordance with the requirements for location (2) in Table 1.4.4 Cargo and accommodation deck longitudinals and location (3) in Table 1.4.5 Strength/weather, cargo and accommodation deck beams in Pt 4, Ch 1 General Cargo Ships, using design heads not less than those specified in Table 3.5.1 in Chapter 3 for superstructure decks.

2.4.2 Transverse deck beams in deckhouses and deck longitudinals other than as in Pt 3, Ch 8, 2.7 Erections contributing to hull strength are to have a section modulus, Z , not less than:

$$Z = 0,0048 h_2 s l_e^2 k \text{ cm}^3, \text{ but in no case less than:}$$

$$Z = 0,025s \text{ cm}^3$$

and the value of h_2 , the load head, is to be taken as not less than:

on first tier decks	0,9 m
on second tier decks	0,6 m
on third tier decks and above	0,45 m.

2.5 Deck girders and transverses

2.5.1 The section modulus of deck girders and transverses is to be in accordance with the requirements for location (1) in Table 1.4.6 Deck girders, transverses and hatch beams in Pt 4, Ch 1 General Cargo Ships, using design heads not less than those specified in Table 3.5.1 Design heads and permissible cargo loadings for superstructure decks.

2.6 Strengthening at ends and sides of erections

2.6.1 Web frames or partial bulkheads are to be fitted within poops and bridges that have large deckhouses or other erections above.

2.6.2 Web frames or equivalent strengthening are also to be arranged to support the sides and ends of large deckhouses.

2.6.3 These web frames should be spaced about 9 m apart and are to be arranged, where practicable, in line with watertight bulkheads below. Webs are also to be arranged in way of large openings, boats, davits and other points of high loading.

2.6.4 Arrangements are to be made to minimise the effect of discontinuities in erections. All openings cut in the sides are to be substantially framed and have well rounded corners. Continuous coamings or girders are to be fitted below and above doors and similar openings. House tops are to be strengthened in way of davits. Special care is to be taken to minimise the size and

number of openings in the side bulkheads in the region of the ends of erections within $0,5L$ amidships. Account is to be taken of the high vertical shear loading which can occur in these areas.

2.6.5 Adequate support under the ends of erections is to be provided in the form of webs, pillars, diaphragms or bulkheads in conjunction with reinforced deck beams. At the corners of houses and in way of supporting structures, attention is to be given to the connection to the deck, and inserts or equivalent arrangements are generally to be fitted especially for erections that are effective in resisting vertical hull girder bending as defined in Pt 3, Ch 3, 4.2 Collision bulkhead.

2.6.6 The side plating of bridges having a length of $0,15L$ or greater is to be increased in thickness by 25 per cent at the ends of the structure, and is to be tapered into the upper deck sheerstrake. This plating is to be efficiently stiffened at the upper edge and supported by web plates not more than 1,5 m from the end bulkhead. Proposals for alternative arrangements, including the use of higher tensile steel, will be individually considered.

2.7 Erections contributing to hull strength

2.7.1 Where a long superstructure or deckhouse is fitted, extending within $0,5L$ amidships, the scantlings of the first tier deck plating and longitudinals may be required to be increased, *see also* Pt 3, Ch 3, 3.4 Calculation of hull section modulus and Pt 3, Ch 4, 2.3 Open type ships.

2.8 Unusual designs

2.8.1 Where superstructures or deckhouses are of unusual design, the strength is to be not less than that required by this Chapter for a conventional design.

■ Section 3 Aluminium erections

3.1 Scantlings

3.1.1 Where an aluminium alloy complying with Ch 8 Aluminium Alloys of the Rules for Materials (Part 2) is used in the construction of erections, the scantlings of these erections are to be increased (relative to those required for steel construction) by the percentages given in Table 8.3.1 Percentage increase of scantlings.

Table 8.3.1: Percentage increase of scantlings

Item	Percentage increase
Fronts, sides, aft ends, unsheathed deck plating	20
Decks sheathed in accordance with Pt 3, Ch 8, 2.3 Deck plating	10
Deck sheathed with wood, and on which the plating is fixed to the wood sheathing at the centre of each beam space	Nil
Stiffeners and beams	70
Scantlings of small isolated houses	Nil

3.1.2 The thickness, t , of aluminium alloy members is to be not less than:

$$t = 2,5 + 0,022d_w \text{ mm but need not exceed } 10 \text{ mm}$$

where

$$d_w = \text{depth of the section, in mm.}$$

3.1.3 The minimum moment of inertia, I , of aluminium alloy stiffening members is to be not less than:

$$I = 5,25Z l_e \text{ cm}^4$$

Where l_e is the effective length of the member in metres, as defined in Pt 3, Ch 8, 1.2 Symbols, and Z is the section modulus of the stiffener and attached plating calculated using the formulae in Pt 3, Ch 8, 2.2 Stiffeners and their connections and Pt 3, Ch 8, 2.4 Deck longitudinals and beams, as applicable, taking k as 1.

3.2 Bimetallic joints

3.2.1 Where aluminium erections are arranged above a steel hull, details of the arrangements in way of the bimetallic connections are to be submitted.

■ **Section 4** **Forecastles**

4.1 Construction

4.1.1 Side plating and framing of forecastles are to comply with the requirements of Pt 3, Ch 5, 3 Shell envelope plating and Pt 3, Ch 5, 4 Shell envelope framing respectively. The end plating and its stiffening are to comply with the requirements of Pt 3, Ch 8, 2.1 Thickness of bulkhead and side plating and Pt 3, Ch 8, 2.2 Stiffeners and their connections respectively.

4.1.2 The bow height and the extent of the forecastle are to comply with the requirements of Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle.

4.1.3 The thickness, t , of forecastle deck plating is to be not less than:

$$t = (6 + 0,017L) \sqrt{\frac{ks}{s_b}} \text{ mm}$$

4.1.4 Deck longitudinals and beams are to comply with Pt 3, Ch 5, 2.3 Deck stiffening, using a head of 1,8 m forward of 0,075 L and 1,5 m between 0,12 L and 0,075 L .

4.1.5 Girders, transverses and pillars are to be in accordance with Pt 3, Ch 5, 2.4 Deck supporting structure, and the depth of the girder or transverse is to be not less than twice that of the beam or longitudinal supported.

■ **Section 5** **Bulwarks, guard rails and other means for the protection of crew**

5.1 General requirements

5.1.1 Bulwarks or guard rails are to be provided around all exposed decks. Bulwarks or guard rails are to be not less than 1,0 m in height measured above sheathing, and are to be constructed as required by this Section. Consideration will be given to cases where this height would interfere with the normal operation of the ship.

5.1.2 The freeing arrangements in bulwarks are to be in accordance with Pt 3, Ch 8, 5.3 Freeing arrangements.

5.1.3 Guard rails fitted on superstructure and freeboards decks are to have at least three courses. The opening below the lowest course of guard rails is not to exceed 230 mm. The other courses are to be spaced not more than 380 mm apart. In the case of ships with rounded gunwales, the guard rail supports are to be placed on the flat of the deck. In other locations, guard rails with at least two courses are to be fitted.

5.1.4 Guard rails are to be fitted with fixed, removable or hinged stanchions fitted no more than 1,5 m apart. Removable or hinged stanchions shall be capable of being locked in the upright position.

5.1.5 At least every third stanchion is to be supported by a stay. In lieu of this, flat steel stanchions shall be of increased breadth as given in Figure 8.5.1 Support of stanchions, and aligned with a member below deck unless the deck plating thickness exceeds 20 mm. Guard rail stanchions of increased breadth are to be welded to the deck with double continuous fillet weld with a minimum leg size of 7 mm or in compliance with a standard recognised by LR.

In lieu of at least every third stanchion supported by stay, alternatively:

- (a) at least every third stanchion shall be of increased breadth: $kb_s = 2,9b_s$
- (b) at least every second stanchion shall be of increased breadth: $kb_s = 2,4b_s$
- (c) every stanchion shall be of increased breadth: $kb_s = 1,9b_s$

where

b_s breadth of normal stanchion as specified in an appropriate standard recognised by LR

Stanchions with increased breadth are to be aligned with members below deck, minimum 100 x 12 flat bar welded to deck by double continuous fillet weld. Stanchions with increased breadth need not be aligned with under deck structure for deck plating exceeding 20 mm.

Figure 8.5.1: Support of stanchions

5.1.6 Where necessary for the normal operation of the ship, steel wire ropes may be accepted in lieu of guard rails. Wires are to be made taut by means of turnbuckles. Chains are only permitted in short lengths in way of access openings.

5.1.7 Satisfactory means, in the form of guard rails, life-lines, handrails, gangways, underdeck passageways or other equivalent arrangements, are to be provided for the protection of the crew in getting to and from their quarters, the machinery space and all other parts used in the necessary work of the ship in accordance with Table 8.5.1 Protection of crew .

5.1.8 Where gangways on a trunk are provided by means of a stringer plate fitted outboard of the trunk side bulkheads (port and starboard), each gangway is to be a solid plate, effectively stayed and supported, with a clear walkway at least 450 mm wide, at or near the top of the coaming, with guard rails complying with Pt 3, Ch 8, 5.1 General requirements and hatch cover securing appliances accessible from the gangway.

5.1.9 Where permitted by the National Authority, gangways or walkways may be omitted on ships engaged on protected or extended protected water service. However, life-lines are to be provided on tankers and flush deck ships, or where the cargo hatch coamings are less than 600 mm high.

5.1.10 For a Type 'A' ship with freeboards assigned greater than, or equal to, Type 'B', a life-line may be provided in lieu of a walkway.

5.2 Bulwark construction

5.2.1 Plate bulwarks are to be stiffened by a strong rail section and supported by stays from the deck. The spacing of these stays forward of $0,07L$ from the forward perpendicular is to be not more than 1,2 m on Type 'A', Type 'B-60' and Type 'B-100' ships (as defined in Pt 3, Ch 11, 1.1 Application), and not more than 1,83 m on other Types. Elsewhere, bulwark stays are to be not more than 1,83 m apart. Where bulwarks are cut to form a gangway or other opening, stays of increased strength are to be fitted at the ends of the openings. Bulwarks are to be adequately strengthened in way of eyeplates for cargo gear, and in way of mooring pipes the plating is to be doubled or increased in thickness and adequately stiffened.

5.2.2 Bulwarks should not be cut for gangway or other openings near the breaks of superstructures, and are also to be arranged to ensure their freedom from main structural stresses. See shell plating in appropriate Chapters.

5.2.3 The section modulus, Z , at the bottom of the bulwark stay is to be not less than:

$$Z = (33,0 + 0,44L) h^2 s \text{ cm}^3$$

where

h = height of bulwark from the top of the deck plating to the top of the rail, in metres

s = spacing of the stays, in metres, in accordance with Pt 3, Ch 8, 5.2 Bulwark construction

L = length of ship, in metres (as defined in Pt 3, Ch 1, 6.1 Principal particulars), but to be not greater than 100 m.

5.2.4 In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck, and where, at the ends of the ship, the bulwark plating is connected to the sheerstrake, a width of plating not exceeding 600 mm may also be included. The free edge of the stay is to be stiffened.

5.2.5 Bulwark stays are to be supported by, or to be in line with, suitable underdeck stiffening, which is to be connected by double continuous fillet welds in way of the bulwark stay connection.

5.2.6 It should be noted that the above requirements do not allow for any loading from deck cargoes.

5.3 Freeing arrangements

5.3.1 The requirements of Pt 3, Ch 8, 5.3 Freeing arrangements to Pt 3, Ch 8, 5.3 Freeing arrangements apply to ships of Type 'B'. Additional requirements applicable to ships of Type 'A', Type 'B-100' and Type 'B-60' are indicated in Pt 3, Ch 8, 5.3 Freeing arrangements and Pt 3, Ch 8, 5.3 Freeing arrangements. The ship Types are as defined in Pt 3, Ch 11, 1.1 Application.

5.3.2 Where bulwarks on the weather portions of freeboard or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of large quantities of water by means of freeing ports, and also for draining them.

5.3.3 The minimum freeing area on each side of the ship, for each well on the freeboard deck or raised quarterdeck, where the sheer in the well is not less than the standard sheer required by the *International Convention on Load Lines, 1966*, is to be derived from the following formulæ:

(a) where the length, l , of the bulwark in the well is 20 m or less:

$$\text{area required} = 0,7 + 0,035 l \text{ m}^2$$

(b) where the length, l , exceeds 20 m:

$$\text{area required} = 0,07 l \text{ m}^2$$

l need not be taken greater than $0,7L_L$, where L_L is the length of the ship as defined in Pt 3, Ch 1, 6.1 Principal particulars.

5.3.4 If the average height of the bulwark exceeds 1,2 m or is less than 0,9 m, the freeing area is to be increased or decreased, respectively, by $0,004 \text{ m}^2$ per metre of length of well for each 0,1 m increase or decrease in height respectively.

5.3.5 The minimum freeing area for each well on a first tier superstructure is to be half the area calculated from Pt 3, Ch 8, 5.3 Freeing arrangements.

5.3.6 Two-thirds of the freeing port area required is to be provided in the half of the well nearest to the lowest point of the sheer curve.

Ship Type	Location in ship	Assigned Summer Freeboard, in mm	Acceptable arrangements according to type of freeboard assigned

Symbols

A_f = the minimum summer freeboard calculated as Type A ship regardless of type freeboard actually assigned

H_s = the standard height of superstructure as defined in *International Convention on Load Lines*, Regulation 33

Acceptable arrangements:

Acceptable arrangements referred to in the Table are defined as follows:

a A well lighted and ventilated under-deck passageway (clear opening 0,8 m wide, 2 m high) as close as practicable to the freeboard deck, connecting and providing access to the locations in question.

b A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the centreline of the ship, providing a continuous platform at least 0,6 m in width and a non-slip surface, with guard rails extending on each side throughout its length. Guard-rails shall be at least 1 m high with courses as required in Pt 3, Ch 8, 5.1 General requirements, and supported by stanchions spaced not more than 1,5 m; a foot-stop shall be provided.

c A permanent walkway at least 0,6 m in width fitted at freeboard deck level consisting of two rows of guard-rails with stanchions spaced not more than 3 m. The number of courses of rails and their spacing are to be as required by Pt 3, Ch 8, 5.1 General requirements. On Type B ships, hatchway coamings not less than 0,6 m in height may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.

d A 10 mm minimum thickness diameter wire rope life-line supported by stanchions about 10 m apart, or a single hand rail or wire rope attached to hatch coamings, continued and adequately supported between hatchways.

e A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the centreline of the ship:

- located so as not to hinder easy access across the working areas of the deck;
- providing a continuous platform at least 1,0 m in width;
- constructed of fire resistant and non-slip material;
- fitted with guard rails extending on each side throughout its length; guard rails should be at least 1,0 m high with courses as required by Regulation 25(3) and supported by stanchions spaced not more than 1,5 m;
- provided with a foot stop on each side;
- having openings, with ladders where appropriate, to and from the deck. Openings should not be more than 40 m apart;
- having shelters of substantial construction set in way of the gangway at intervals not exceeding 45 m if the length of the exposed deck to be traversed exceeds 70 m. Every such shelter should be capable of accommodating at least one person and be so constructed as to afford weather protection on the forward port and starboard sides.

f A permanent and efficiently constructed walkway fitted at freeboard deck level on or as near as practicable to the centre line of the ship having the same specifications as those for a permanent gangway listed in (e) except for foot-stops. On Type B ships (certified for the carriage of liquids in bulk), with a combined height of hatch coaming and fitted hatch cover of together not less than 1 m in height the hatchway coamings may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.

Alternative transverse locations for c, d and f:

- (1) At or near centreline of ship; or fitted on hatchways at or near centreline of ship.
- (2) Fitted on each side of the ship.
- (3) Fitted on one side of the ship, provision being made for fitting on either side.
- (4) Fitted on one side of the ship only.
- (5) Fitted on each side of hatchways as near to the centreline as practicable.

NOTES

Note 1. In all cases where wire ropes are fitted, adequate devices are to be provided to ensure their tautness.

Note 2. Wire ropes may only be accepted in lieu of guard rails in special circumstances and then only in limited lengths.

Note 3. Lengths of chain may only be accepted in lieu of guard rails if fitted between two fixed stanchions.

Note 4. Where stanchions are fitted, every third stanchion is to be supported by a bracket or stay.

Note 5. Removable or hinged stanchions shall be capable of being locked in the upright position.

Note 6. A means of passage over obstructions, if any, such as pipes or other fittings of a permanent nature, should be provided.

Note 7. Generally, the width of the gangway or deck-level walkway should not exceed 1,5 m.

5.3.8 In ships with no sheer the freeing area as calculated from Pt 3, Ch 8, 5.3 Freeing arrangements is to be increased by 50 per cent. Where the sheer is less than the standard, the percentage is to be obtained by linear interpolation.

5.3.9 Where the length of the well is less than 10 m, or where a deckhouse occupies most of the length, the freeing port area will be specially considered but in general need not exceed 10 per cent of the bulwark area.

5.3.10 Where it is not practical to provide sufficient freeing port area in the bulwark, particularly in small ships, credit can be given for bollard and fairlead openings where these extend to the deck.

5.3.11 Where a ship fitted with bulwarks has a continuous trunk, or hatch side coamings that are continuous, or substantially continuous, the minimum freeing area is to be not less than 20 per cent of the total bulwark area where the width of trunk or hatchway is $0,4B$ or less, and not less than 10 per cent of the total bulwark area when the width of the trunk or hatch is $0,75B$ or greater. The freeing area required for an intermediate width of trunk or hatch is to be obtained by linear interpolation.

5.3.12 Where the trunk referred to in Pt 3, Ch 8, 5.3 Freeing arrangements or its equivalent is included in the calculation of freeboard, open rails are to be fitted for at least 50 per cent of the length of the exposed part of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33 per cent of the bulwark area. The freeing area is to be placed in the lower part of the bulwark.

5.3.13 Where a deckhouse has a breadth less than 80 per cent of the beam of the ship, or the width of the side passageways exceeds 1,5 m, the arrangement is considered as one well. Where a deckhouse has a breadth equal to or more than 80 per cent of the beam of the ship, or the width of the side passageways does not exceed 1,5 m, or when a screen bulkhead is fitted across the full breadth of the ship, this arrangement is considered as two wells, before and abaft the deckhouse.

5.3.14 Suitable provision is also to be made for the rapid freeing of water from recesses formed by superstructures, deckhouses and deck cargo arrangements, etc. in which water may be shipped and trapped. Deck gear, particularly on fishing vessels, is not to be stowed in such a manner as to obstruct unduly the flow of water to freeing ports.

5.3.15 The lower edges of freeing ports are to be as near to the deck as practicable, and should not be more than 100 mm above the deck.

5.3.16 Where freeing ports are more than 230 mm high, vertical bars spaced 230 mm apart may be accepted as an alternative to a horizontal rail to limit the height of the freeing port.

5.3.17 Where shutters are fitted, the pins or bearings are to be of a non-corrodible material, with ample clearance to prevent jamming. The hinges are to be within the upper third of the port. Shutters are not to be fitted with securing appliances.

5.3.18 Ships of Type 'A' and Type 'B-100' are to have open rails for at least half the length of the exposed part of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33 per cent of the total area of the bulwark. The freeing area is to be placed in the lower part of the bulwark.

5.3.19 Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed part of the freeboard deck.

5.3.20 Ships of Type 'B-60' are to have a minimum freeing area of at least 25 per cent of the total area of the bulwark. The freeing area is to be placed in the lower part of the bulwark.

5.3.21 Gutter bars greater than 300 mm in height fitted on the weather decks of tankers are to be treated as bulwarks and freeing ports arranged as required by this Section. Closures for use during loading and discharge operations are to be arranged in such a way that jamming cannot occur while at sea.

5.3.22 In ships having superstructures which are open at either or both ends to wells formed by bulwarks on the open deck, adequate provision for freeing the open spaces are to be provided as follows:

The freeing port area, A_w for the open well:

$$A_w = (0,07l_w + A_c)(S_c)\left(\frac{0,5h_s}{h_w}\right)$$

The freeing port area, A_s for the open superstructure:

$$A_s = (0,07l_t)(S_c)\left(\frac{b_o}{l_t}\left(1 - \left(\frac{l_w}{l_t}\right)^2\right)\right)\left(\frac{0,5h_s}{h_w}\right)$$

where

l_w = the length of the open deck enclosed by bulwarks, in metres

l_s = the length of the common space within the open superstructure, in metres

$l_t = l_w + l_s$ but if 20 m or less then the freeing area is to be calculated in accordance with Pt 3, Ch 8, 5.3 Freeing arrangements

S_c = sheer correction factor, maximum 1,5 as defined in Pt 3, Ch 8, 5.3 Freeing arrangements

b_o = breadth of openings in the end bulkhead of the enclosed superstructure, in metres

h_w = distance of the well deck above the freeboard deck, in metres

h_s = one standard superstructure height, see Pt 3, Ch 8, 1.3 Definition of tiers

h_b = actual height of the bulwark, in metres

A_c = bulwark height correction factor taken as;

= 0 for bulwarks between 0,9 and 1,2 m in height

= $l_w \left(\frac{(h_b - 1,2)}{0,1} \right) (0,004) \text{ m}^2$ for bulwarks of height greater than 1,2 m, and

= $l_w \left(\frac{(h_b - 0,9)}{0,1} \right) (0,004) \text{ m}^2$ for bulwarks of height less than 0,9 m.

To adjust the freeing port area for the distance of the well deck above the freeboard deck, for decks located more than $0,5h_s$ above the freeboard deck, multiply by the factor $0,5 (h_s/h_w)$.

5.4 Free flow area

5.4.1 The effectiveness of the freeing port area in bulwarks of vessels not fitted with a continuous deck obstruction, depends on the free flow across the deck.

5.4.2 The free flow area is the net total longitudinal area of the transverse passageways or gaps between hatchways and superstructures or deckhouses, due account being made for any obstructions such as equipment or other fittings. The height of passageways or gaps used in the calculation of the area is the height of the bulwark.

5.4.3 The provision of freeing area in bulwarks should be related to the net free flow area as follows:

- If the free flow area is equal to, or greater than the freeing port area calculated from Pt 3, Ch 8, 5.3 Freeing arrangements when the hatchway coamings are continuous, then the minimum freeing area calculated from Pt 3, Ch 8, 5.3 Freeing arrangements is sufficient.
- If the free flow area is less than the freeing port area calculated from Pt 3, Ch 8, 5.3 Freeing arrangements, then the minimum freeing area is to be that calculated from Pt 3, Ch 8, 5.3 Freeing arrangements.
- If the free flow area is less than the freeing port area derived from (a) but greater than that derived from Pt 3, Ch 8, 5.4 Free flow area, the minimum freeing area, F , in the bulwark is to be obtained from the following formula:

$$F = F_1 + F_2 - f_p \text{ m}^2$$

where:

f_p = total net area of passages and gaps between hatchways, superstructures and deckhouses (the free flow area)

F_1 = minimum area from Pt 3, Ch 8, 5.3 Freeing arrangements

where:

F_2 = minimum area from Pt 3, Ch 8, 5.3 Freeing arrangements

5.5 Special requirements for tugs and offshore supply ships

5.5.1 In tugs and offshore supply ships where there is a recess at the after end of the forecastle for the towing winch, the freeing port area in way of the recess is to be calculated as follows:

B = breadth of ship

b = breadth of recess

L = length of well

l = mean length of recess

a = freeing area for well length L

Freeing port area in way of recess:

$$A = a \frac{l}{L}$$

Reduction due to breadth of recess:

$$A_1 = A \frac{b}{B}$$

Reduce A_1 by 25 per cent for winch area:

$$A_2 = 0,75 A_1$$

= required freeing port area each side in way of the recess

Where the winch is enclosed in a non-weathertight compartment freeing ports are not required but adequate drainage by means of scuppers is to be provided.

Section

- 1 **General**
- 2 **Timber deck cargoes**
- 3 **Decks loaded by wheeled vehicles**
- 4 **Movable decks**
- 5 **Helicopter landing areas**
- 6 **Lifting appliances and support arrangements**
- 7 **Bottom strengthening for loading and unloading aground**
- 8 **Strengthening for regular discharge by heavy grabs**

■ *Section 1* **General**

1.1 Application

1.1.1 The requirements of this Chapter are to be taken in conjunction with the Chapters of Pt 3 Ship Structures (General) and Pt 4 Ship Structures (Ship Types) applicable to the particular ship type.

1.2 Symbols

1.2.1 The following symbols and definitions are applicable to this Chapter:

k = higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel

l = overall length, of the stiffening member, in metres

l_e = effective length, in metres, of the stiffening member, measured between span points, see Pt 3, Ch 3, 3.3 Determination of span point

s = spacing, of stiffeners, in mm

B = moulded breadth of ship, in metres, see Pt 3, Ch 1, 6.1 Principal particulars

L = length of ship, in metres, see Pt 3, Ch 1, 6.1 Principal particulars

Z = section modulus of the stiffening member, in cm^3 , see Pt 3, Ch 3, 3.2 Geometric properties of section

1.2.2 Other symbols are defined in the appropriate Section.

■ *Section 2* **Timber deck cargoes**

2.1 Application

2.1.1 Where timber load lines are to be assigned, the full requirements of this Section are to be complied with, and the ship will be eligible to be assigned the notation 'timber deck cargoes'.

2.1.2 In other cases, proposals to carry timber deck cargoes which will impose on the weather deck a mean cargo loading in excess of 8,5 kN/m² (0,865 tonne-f/m²) will be considered on the basis of these requirements. In particular, the requirements of Pt 3, Ch 9, 2.9 Longitudinal strength to Pt 3, Ch 9, 2.12 Direct calculations are to be complied with.

2.2 Symbols and definitions

2.2.1 The term 'timber deck cargo' means a cargo of timber carried on an uncovered part of the freeboard or superstructure deck. The term does not include wood pulp or similar cargo.

2.2.2 The symbols used in this Section are defined as follows:

C = mean stowage rate, in m³/tonne, of the timber deck cargo, making allowance for normal battens, etc.

h = the height, in metres, to which the timber deck cargo is to be stowed, measured vertically from the deck or hatch cover as applicable.

2.2.3 Other symbols are defined in Pt 3, Ch 9, 1.2 Symbols.

2.3 General

2.3.1 Attention is drawn to the requirements of the *International Convention for the Safety of Life at Sea, 1974, Chapter VI*, as amended, the *International Load Line Convention, 1966*, concerning timber deck cargoes, and its 1988 Protocol, and to National Regulations. Attention is also drawn to IMO Resolution A.1048(27) Code of Safe Practice for Ships Carrying Timber Deck Cargoes, 2011.

2.3.2 Timber deck cargoes are to be loaded, stowed and secured throughout the voyage, in accordance with the Cargo Securing Manual approved by the Flag Administration as required by SOLAS Chapter VI.

2.3.3 Each cargo securing arrangement for timber deck cargoes detailed in the ship's Cargo Securing Manual is to be documented by a lashing plan that shows the following:

- (a) maximum cargo weight for which the arrangement is designed;
- (b) maximum stowage height;
- (c) required number and strength of blocking devices and lashings, as applicable;
- (d) required pre-tension in lashings;
- (e) other cargo properties of importance for the securing arrangement, such as friction, rigidity of timber packages;
- (f) illustrations of all securing items that might be used;
- (g) any restrictions regarding maximum accelerations, weather criteria, restricted sea areas and for non-winter conditions only;
- (h) the walkway/life-line arrangements; and
- (i) stowage arrangement, which is to be in accordance with Pt 3, Ch 9, 2.7 Stowage.

The Cargo Securing Manual is to be submitted for approval, and a copy placed on board the ship.

2.3.4 All timber deck cargoes must be compactly stowed, lashed and secured. Friction alone is not deemed sufficient and such methods are not endorsed by Lloyd's Register.

2.3.5 Timber freeboards cannot be used where wood pulp is being carried as the deck cargo. Packaged timber (timber which has been prelashed) may be carried on deck with the ship at its timber freeboards.

2.3.6 Type 'B-60' ships may have timber freeboards assigned based on ordinary Type 'B' freeboards.

2.3.7 Timber freeboards are not appropriate for ships which are assigned freeboards from a second deck. However, where the maximum geometric upper deck draught is restricted, a restricted timber draught may be assigned.

2.3.8 It is the Master's responsibility to ensure loose gear (e.g. uprights, wire lashings and life-lines) are supplied and fitted onboard in accordance with the approved timber deck cargo loading and lashing plan when the ship is carrying timber deck cargoes. However, it is not a requirement that loose gear remains permanently on board a ship assigned timber freeboards.

2.4 Arrangements

2.4.1 Double bottom tanks within the midship half-length are to have adequate longitudinal subdivision.

2.4.2 A forecastle of at least standard height of a superstructure, defined by Regulation 33 of the International Load Line Convention, as amended, and of length at least 0,07L is to be fitted. In addition, in ships of less than 100 m in length, a poop of at

least standard height, or a raised quarterdeck with a deckhouse or strong steel hood of at least the same total height, is to be fitted.

2.5 Uprights

2.5.1 Uprights are to be of adequate strength but are not to exceed the strength of the bulwark. Where timber uprights are used, it is the responsibility of the Master to use timber which is of a type and grade which has proved satisfactory for the purpose. Where a timber load line is not assigned and uprights are not connected to the bulwark, uprights are to be of adequate strength but need not relate to that of the bulwark, see Pt 3, Ch 9, 2.1 Application.

2.5.2 Uprights are to be used for all timber deck cargoes with the exception that, where only packaged timber is to be carried, uprights may be omitted, depending on racking strength and not including uprights or stoppers (low uprights) situated either side of hatch covers.

2.5.3 The spacing of the uprights is to be suitable for the length and character of the timber to be carried but is not to exceed 3 m.

2.5.4 Each upright is to extend above the top of the cargo and be fitted with a strap or bracket support at the top of the bulwark to hold it upright whilst loading.

2.5.5 Strong permanent bulwarks, or efficient rails of specially strong construction, are to be fitted. Steel bulwarks, along with guard rails and stanchions, are acceptable as supports for uprights, provided substantial sockets are built for each upright.

2.5.6 Deck sockets are to be of a size to suit the dimensions of the uprights and are to be not less than 100 mm in depth with drainage provided. They are to be efficiently connected to the hull structure. A locking pin or wedge is to be provided to prevent the upright lifting out of the socket.

2.6 Lashings

2.6.1 The timber deck cargo is to be secured along its length by independent top over lashings.

2.6.2 The spacing of top over lashings is to be determined by the height of the cargo above the deck or by the type of timber, see Pt 3, Ch 9, 2.6 Lashings and Pt 3, Ch 9, 2.6 Lashings:

- (a) For heights not more than 2,5 m, the spacing is to be not more than 3m.
- (b) For heights above 2,5 m, the spacing is to be not more than 1,5 m.

2.6.3 Where only packaged timber is to be carried, and uprights are omitted, see 2.5.2, lashings are to be spaced not more than 1, 1,5 m apart.

2.6.4 Round wood timber deck cargo is to be secured throughout its length by top over lashings spaced not more than 1,5 m apart.

2.6.5 At the fore and aftermost ends of each continuous timber deck stow, the spacing of the lashings determined from Pt 3, Ch 9, 2.6 Lashings, Pt 3, Ch 9, 2.6 Lashings or Pt 3, Ch 9, 2.6 Lashings is to be halved.

2.6.6 The spacing of lashings is to be such that lashings are positioned as close as practicable to the ends of each continuous timber deck stow.

2.6.7 Round wood timber deck cargo stowed over and above hatches, in addition to Pt 3, Ch 9, 2.6 Lashings, is to be further secured by a system of athwartship lashings connecting respective port and starboard uprights at three quarters of the height of the stow. If the height of the hatch cover over which the cargo is stowed is less than 2 m, a further athwartship lashing is to be installed 1 m above the hatch cover.

2.6.8 Lashings and fittings must not:

- (a) have a breaking strength of less than 133 kN;
- (b) elongate more than 5 per cent at 80 per cent of the breaking strength;
- (c) show any permanent deformation at less than 40 per cent of the breaking strength.

2.6.9 Where timber is in lengths of less than 3,6 m, the spacing of lashings is to be reduced, or other suitable provisions made to suit the length of the timber.

2.6.10 Open hooks, which may loosen if the lashing becomes slack, are not to be used in securing arrangements for timber deck cargoes and web lashing is not to be used in combination with chain or wire lashing.

2.6.11 Slip hooks or other appropriate methods may be used for quick and safe adjustment of lashings. Pelican hooks, when used, are to be moused.

2.6.12 Corner protectors are to be used to prevent lashings from cutting into the cargo and to protect lashings from damage at sharp corners.

2.6.13 Every lashing is to be provided with a tightening device or system, situated so that it can be safely and efficiently operated when required. The magnitude of the components of the resolved load produced by the tightening device or system is not to be less than:

- (a) 27 kN in the horizontal; and
- (b) 16 kN in the vertical.

2.6.14 Once the lashings are secured, the tightening device or system is to have not less than half the tightening capacity available for further use.

2.6.15 If wire rope clips are used to make a joint in a wire lashing, the following conditions are to be observed to avoid a significant reduction in strength:

- (a) the number and size of rope clips utilised are to be in proportion to the diameter of the wire rope and no fewer than three, each spaced at intervals of not less than 150 mm.
- (b) the saddle portion of the clip is to be applied to the live load segment; and
- (c) rope clips are to be initially tightened so that they visibly compress the wire rope and are subsequently to be re-tightened after the lashing has been stressed.

2.6.16 Bulldog grips are only suitable for a standard wire rope of right-hand lay having six strands. Such grips are not to be used for wire rope of left-hand lay or different construction.

2.6.17 Rounded angle pieces of suitable material and design are to be used along the upper outboard edge of the stow to bear the stress and permit free reeving of the lashings.

2.6.18 Eye plates are to be of substantial construction, effectively connected to the hull structure, and placed at intervals determined from Pt 3, Ch 9, 2.6 Lashings to Pt 3, Ch 9, 2.6 Lashings. The distance from a superstructure end bulkhead to the first eye plate and lashing is to be not more than 2 m.

2.7 Stowage

2.7.1 The stowage arrangements are to be detailed within the lashing plan, see Pt 3, Ch 9, 2.3 General.

2.7.2 Timber deck cargoes are to extend over at least the entire available length, which is the total length of the well or wells between superstructures. Where there is no limiting superstructure at the after end, the timber is to extend at least to the after end of the aftermost hatchway.

2.7.3 The timber deck cargo is to extend athwartships as close as possible to the ship's side, due allowance being made for obstructions, provided any gap thus created at the side of the ship does not exceed a mean of four per cent of the breadth.

2.7.4 The timber is to be stowed as solidly as possible to at least the standard height of a superstructure other than a raised quarter deck. It is not to interfere in any way with the safe navigation and necessary work of the ship.

2.7.5 On a ship within a seasonal winter zone in winter, the height of the deck cargo above the deck exposed to weather must not exceed one third of the extreme breadth of the ship.

2.7.6 Cargo which overhangs hatch coamings or other structures in the longitudinal direction by more than a third of their individual or packed length is to be supported at the outer end by other cargo stowed on deck or by structure of adequate strength.

2.8 Safety arrangements

2.8.1 If there is no convenient passage on or below the deck of the ship, a walkway is to be provided over the timber deck cargo. This walkway is either to be:

- (a) At, or near, the centreline of the ship, consisting of two sets of guard wires, spaced 1 m apart, each with more than three courses of wire. The opening below the lowest course is not to exceed 230 mm; the remaining courses are to be spaced not more than 380 mm apart to a height of at least 1 m above the timber deck cargo. The guard wires are to be secured to stanchions. The stanchions are to be not more than 3 m apart, and these are to be secured to the timber cargo by spikes, or other equivalent means.

- (b) Alternatively, where uprights are used, guard wires, spaced vertically not more than 330 mm apart, are to be secured to the uprights along the length of the timber deck cargo on both port and starboard sides to a height of not less than 1 m above the cargo. A wire life-line is also to be fitted at the centreline of the ship, adequately supported by stanchions spaced not more than 10 m apart.

A safe walking surface, not less than 600 mm in width, is to be fitted over the cargo and effectively secured to the top of it in line with the walkway or adjacent to the life-line. All lines are to be taut using tightening devices.

2.8.2 Safe access is to be provided to the top of the timber deck cargo by means of properly constructed ladders, steps or ramps fitted with guard lines or handrails.

2.8.3 All openings in the weather deck are to be capable of being properly closed and secured tight. Ventilators, air pipes and other fittings enclosing openings are to be efficiently protected against damage.

2.8.4 Access hatches, vents, air pipes, fire hydrants, hoses, valve operating positions, sounding pipes and other essential equipment are to be clearly marked and left accessible.

2.9 Longitudinal strength

2.9.1 The proposed timber deck loading conditions are to be taken into account in the longitudinal strength calculations see Pt 3, Ch 4 Longitudinal Strength, and details are to be included in the ship's Loading Manual.

2.10 Deck loading and scantlings

2.10.1 In general, the stowage rate, C , of timber deck cargoes is to be taken as:

- (a) for round timber and logs:

$$C = 2,1 \text{ m}^3/\text{tonne}$$

- (b) for packaged sawn timber:

$$C = 1,45 \text{ m}^3/\text{tonne}.$$

These values are based on the total volume occupied by the cargo, including normal battens, etc. measured from bulwark to bulwark, and deck, or hatch cover, to top of cargo.

2.10.2 Where it is proposed to store timber more densely than that corresponding to the above values, the appropriate value of C is to be used.

2.10.3 The load height, h , of the cargo at any position is to be determined from the overall heights of cargo stowage as supplied by the Shipbuilder. Where the height of cargo varies, a mean effective load height is to be adopted. Attention is drawn to the limitation on height of cargo contained in the Load Lines Conventions where these apply.

2.10.4 A scantling correction factor, K , is to be determined from $K = \frac{h}{1,08C}$, and the hull scantlings are to be increased as follows:

- (a) **Deck longitudinals.** The section modulus is to be multiplied by the factor $0,5 (1 + K)$.
- (b) **Deck beams.** The load head contained in the expression for section modulus is to be multiplied by K , and the section modulus determined using the increased value.
- (c) **Deck girders and transverses.** The section modulus is to be multiplied by the factor K .
- (d) **Pillars and deck supporting structure.** The design load is to be multiplied by the factor K , and scantlings determined using the increased value.
- (e) **Side structure.** The arrangement and scantlings of side structure are to be considered, and increased scantlings of framing may be required.

2.11 Scantlings of hatch covers

2.11.1 The scantlings of primary supporting members and secondary stiffeners are to comply with Pt 3, Ch 11, 2.3 Load model for distributed cargo load p_L using $p_C = h/C$.

2.11.2 The hatch cover securing and support arrangements, stoppers, etc. and coamings are to be suitably reinforced to take account of increased loading from timber deck cargoes, see Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed.

2.12 Direct calculations

2.12.1 As an alternative to the above, the scantlings of the deck and side structure, and of hatch covers, may be assessed using direct calculations based on the proposed loading of the ship.

2.12.2 In the case of hatch covers, the stress and deflection criteria given in Pt 3, Ch 11, 2.4 Allowable stress and deflection corresponding to a uniformly distributed weather load are not to be exceeded.

■ *Section 3*
Decks loaded by wheeled vehicles

3.1 General

3.1.1 Where it is proposed either to stow wheeled vehicles on the deck or to use wheeled vehicles for cargo handling, the deck and supporting structure are to be designed on the basis of the maximum loading to which they may be subjected in service. Where applicable, the hatch covers are to be similarly designed. In no case, however, are the scantlings to be less than would be required as a weather or cargo deck or hatch cover, as applicable.

3.1.2 The vehicles, types and axle loads, for which the vehicle carrying decks including, where applicable, hatch covers have been approved, are to be stated in the Loading Manual and be contained in a notice displayed on each deck.

3.2 Symbols

3.2.1 The symbols used in this Section are defined in Pt 3, Ch 9, 1.2 Symbols and in the appropriate sub-Section.

3.3 Loading

3.3.1 Details of the deck loading resulting from the proposed stowage or operation of vehicles are to be supplied by the Shipbuilder. These details are to include the wheel load, axle and wheel spacing, tyre print dimensions and type of tyre for the vehicles.

3.3.2 For design purposes, where wheeled vehicles are to be used for cargo handling, the deck is to be taken as loaded with a normal head cargo, except in way of the vehicle.

3.4 Deck plating

3.4.1 The deck plate thickness, t , is to be not less than:

$$t = t_1 + t_c \text{ mm}$$

where

t_c = wear and wastage allowance determined from Table 9.3.2 Wear and wastage allowance

$$= t_1 = \frac{\alpha s}{1000\sqrt{k}} \text{ mm}$$

P_1 = corrected patch load obtained from Table 9.3.1 Deck plate thickness calculation

α = thickness coefficient obtained from Figure 9.3.1 Tyre print chart

β = tyre print coefficient used in Figure 9.3.1 Tyre print chart

$$= \log_{10} \left(\frac{P_1 k^2}{s^2} \right) \times 10^7$$

Table 9.3.1: Deck plate thickness calculation

Symbols	Expression	
a, s, u , and v as defined in Figure 9.3.1 Tyre print chart	$P_1 = \varphi_1 \varphi_2 \varphi_3 \lambda P_w$	
n = tyre connection factor, see Table 9.3.3 Tyre correction factor, n	$\varphi_1 = \frac{2v_1 + 1,1s}{u_1 + 1,1s}$	$v_1 = v$, but $\leq s$ $u_1 = u$, but $\leq a$
P_w = load, in tonnes, on the tyre print. For closely spaced wheels the shaded area shown in Figure 9.3.1 Tyre print chart may be taken as the combined print P_1 = corrected patch load, in tonnes	$\varphi_2 = 1,0$ $= \frac{1}{1,3 - \frac{0,3}{s}(a - u)}$ $= 0,77 \frac{a}{u}$	for $u \leq (a - s)$ for $a \geq u > (a - s)$ for $u > a$
λ = dynamic magnification factor φ_1 = patch aspect ratio correction factor	$\varphi_3 = 1,0$ $= 0,6 \frac{s}{v} + 0,4$ $= 1,2 \frac{s}{v}$	for $v < s$ for $1,5 > \frac{v}{s} \geq 1,0$ for $\frac{v}{s} \geq 1,5$
φ_2 = panel aspect ratio correction factor φ_3 = wide patch load factor	$\lambda = 1,25$ for harbour conditions $= (1 + 0,7n)$ for sea-going conditions	

3.4.2 Where transversely framed decks contribute to the hull girder strength, or where secondary stiffening is fitted perpendicular to the direction of vehicle lanes, the thickness, t , derived from Pt 3, Ch 9, 3.4 Deck plating is to be increased by 1,0 mm.

3.4.3 Where decks are designed for the exclusive carriage of unladen wheeled vehicles, the deck plate thickness, t , may be reduced as follows:

$$t = (t_1 - 0,75) + t_c \text{ mm.}$$

3.4.4 Where it is proposed to carry tracked vehicles, the patch dimensions may be taken as the track print dimensions and P_w is to be taken as half the total weight of the vehicle. The wear and wastage allowance from Table 9.3.2 Wear and wastage allowance is to be increased by 0,5 mm. Deck fittings in way of vehicle lanes are to be recessed.

Table 9.3.2: Wear and wastage allowance

Location	t_c , in mm
Strength deck, weather decks, decks forming crown of tank, inner bottom	1,5
Internal decks elsewhere	0,75

3.4.5 If wheeled vehicles are to be used on insulated decks or tank tops, consideration will be given to the permissible loading in association with the insulation arrangements and the plating thickness.

Table 9.3.3: Tyre correction factor, n

Number of wheels in idealised patch	Pneumatic tyres	Solid rubber tyres	Steel or solid tyres
1	0,6	0,8	1,0
2 or more	0,75	0,9	1,0

3.5 Deck longitudinals and beams

3.5.1 The section modulus, Z , of deck beams or longitudinals is to be not less than that required for a weather or cargo deck as appropriate, nor less than the following:

- (a) For general purpose cargo decks where fork lift trucks are to be used:

$$Z = (0,375K_1 P l_e + 0,00125 K_2 h s l_e^2) k \text{ cm}^3.$$

- (b) For permanent vehicle decks in association with a value of h which need not exceed 2,5 m:

h = normal load height on the deck, in metres

P = total weight, in tonnes, of the vehicle divided by the number of axles. Where distribution of weight is not uniform, P is to be taken as the maximum axle load. For fork lift trucks the total weight is to be applied to one axle

$$Z = (0,536K_1 P l_e + 0,00125 K_2 h s l_e^2) k \text{ cm}^3$$

= where the values of K_1 and K_2 are given in Table 9.3.4 Values of K_1 and K_2 .

- (c) For decks designed for the carriage of wheeled vehicles only that required to satisfy the most severe arrangement of print wheel loads on the stiffener in association with a bending stress of $\frac{100}{k} N/mm^2 \left(\frac{10,2}{k} kgf/mm^2 \right)$ assuming 100 per cent end fixity.

Table 9.3.4: Values of K_1 and K_2

Wheel spacing* Beam span	K_1	K_2
0,1	15,4	1,89
0,2	14,6	1,845
0,3	13,35	1,730
0,4		1,55
	11,8	
0,5 and greater	10,1	1,30

* Outer wheel to outer wheel on axles with multiple wheel arrangements

3.6 Deck girders and transverses

3.6.1 Where the load on deck girders and transverses is uniformly distributed, the section modulus is to be not less than:

$$Z = 4,75bh l_e^2 k \text{ cm}^3$$

where

h = is defined in Pt 3, Ch 9, 3.5 Deck longitudinals and beams

b = mean width of plating supported by a deck girder or transverse, in metres.

3.6.2 Where the member supports point loads, with or without the addition of uniformly distributed load, the section modulus is to be based on a stress of $\frac{123,6}{k} \text{ N/mm}^2 \left(\frac{12,6}{k} \text{ kgf/mm}^2 \right)$, assuming 100 per cent end fixity.

3.6.3 Where it is proposed to carry tracked vehicles, the total weight of the vehicle is to be taken when determining the section modulus of the transverse at the top of a ramp or at other changes of gradient.

3.7 Direct calculations

3.7.1 As an alternative to the above, permissible deck loads may be determined by direct calculation. The assumed loadings in these calculations are to include suitable allowance for weather, generally $2,16 \text{ kN/m}^2$ ($0,22 \text{ tonne-f/m}^2$), where applicable.

3.8 Hatch covers

3.8.1 Where wheeled vehicles are to be used, the hatch cover plating is to be not less in thickness than that required by Pt 3, Ch 9, 3.4 Deck plating, and the modulus of the stiffeners is to be not less than:

$$Z = (K_3 P l_e + 0,00167 K_4 h s l_e^2) k$$

= where the values of K_3 and K_4 are given in Table 9.3.5 Values of K_3 and K_4 and P and h are defined in Pt 3, Ch 9, 3.5 Deck longitudinals and beams.

In no case, however, are the scantlings of plating and stiffeners to be less than would be required as a weather or cargo deck hatch cover, as applicable.

Table 9.3.5: Values of K_3 and K_4

Wheel spacing* Stiffener span	K_3	K_4
0,1	11,96	2,32
0,2	10,69	1,89
0,3	9,58	1,55
0,4	8,46	1,28
0,5	7,46	1,07
0,6	6,51	0,91
0,7	5,55	0,73
0,8	4,23	0,36
0,9	2,38	0,11

* Outer wheel to outer wheel on axles with multiple wheel arrangements

3.8.2 Where unusual arrangements of hatch cover stiffening are proposed, the scantlings may be determined by direct calculations using a two-dimensional grillage idealisation, and the parameters given in Table 11.2.3 Effective breadth e_m of plating of primary supporting members in Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads.

3.9 Train decks

3.9.1 Decks for the transport of railway rolling stock on fixed rails will be specially considered.

3.10 Heavy and special loads

3.10.1 Where heavy or special loads, such as machinery transporters, are proposed to be carried, the scantlings and arrangements of the deck structure will be individually considered.

3.11 Securing arrangements

3.11.1 Details of the connections to the hull of vehicle securing arrangements are to be submitted for approval.

■ *Section 4*
Movable decks

4.1 Classification

4.1.1 Movable vehicle decks hoisted by means of a hydraulic or electrical winch, or lifted by a mechanical lift on board the ship, are to comply with Ch 7 Ro-Ro Access Equipment of LR's *Code for Lifting Appliances in a Marine Environment*.

4.1.2 Movable decks other than described in Pt 3, Ch 9, 4.1 Classification, and which are subjected to general cargo loading, are to comply with the requirements of this Section.

4.2 Symbols

4.2.1 The symbols used in this Section are defined in Pt 3, Ch 9, 1.2 Symbols and in the appropriate sub-Section.

4.3 Arrangements and design

4.3.1 Movable decks are generally to be constructed as pontoons comprising a web structure with top decking. Other forms of construction will be individually considered.

4.3.2 These requirements assume that the pontoons are to be constructed of steel. Other materials will be considered on the basis of equivalent strength.

4.3.3 Positive means of control are to be provided to secure decks in the lowered position.

4.3.4 The decks are to be efficiently supported, and hinges, pillars, chains or other means (or a combination of these) are to be designed on the basis of the imposed loads. Where supporting chains and fittings are required, they are to have a factor of safety of at least two on the proof load.

4.3.5 Plans showing the proposed scantlings and arrangements of the system are to be submitted.

4.3.6 Where it is proposed to stow the pontoons on deck, when not in use, details of the proposals for racks, fittings, etc. are to be submitted for consideration.

4.4 Loading

4.4.1 Design loading for general cargo is to be specified on the plans, together with details of fork lift trucks where appropriate, and submitted for consideration.

4.5 Pontoon deck plating

4.5.1 Where the pontoon is constructed of steel decking with stiffening webs, the deck plate thickness, t , is to be not less than that required by Pt 3, Ch 9, 3.4 Deck plating.

4.5.2 The plate thickness, t , for aluminium pontoons is to be not less than:

$$t = (1,4t_1 + 0,75) \text{ mm}$$

where t_1 is the mild steel thickness as determined from Pt 3, Ch 9, 3.4 Deck plating.

For aluminium pontoons designed for the exclusive carriage of unladen wheeled vehicles:

$$t = 1,4t_1 \text{ mm}$$

4.5.3 Where it is proposed to use plywood decking, the arrangement and thickness will be considered. Plywood alone, is not, generally, to be used for axle loads in excess of 7,8 kN (0,8 tonne-f).

4.5.4 Attention is drawn to National fire regulations which in certain cases may ban the use of plywood and certain other materials in 'special category spaces' on passenger ships.

4.6 Pontoon webs and stiffeners

4.6.1 The section modulus of webs and stiffening of steel pontoons is to be not less than:

$$Z = (0,375K_1 P l_e + 0,00125K_2 h s l_e^2) k cm^3$$

= for general-purpose cargo decks where fork lift trucks may be used where the values of K_1 and K_2 are given in Table 9.4.1 Values of K_1 and K_2 , and

h = load height of cargo on the deck, where this is proposed to be carried, in metres.

P = the total fork lift truck load, in tonnes, is to be applied to one axle.

Table 9.4.1: Values of K_1 and K_2

Wheel spacing* Beam span	K_1	K_2
0,1	15,4	1,89
0,2	14,6	1,845
0,3	13,35	1,730
0,4	11,8	1,55
0,5 and greater	10,1	1,30
* Outer wheel to outer wheel on axles with multiple wheel arrangements		

4.6.2 The section modulus of webs and stiffening of aluminium pontoons is to be not less than that defined in Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners replacing k by k_a where k_a is defined in Pt 3, Ch 2, 1 Materials of construction.

4.6.3 Where plywood decking is proposed, or in other arrangements where the decking is not integral with the stiffening webs, the arrangement of the grillage of webs is to be such as to provide the required strength.

4.7 Deflection

4.7.1 Where wheeled vehicles are to be used, the supporting arrangements are to be such that the movement at the edge of one pontoon relative to the next does not exceed 50 mm during loading or unloading operations.

4.8 Direct calculations

4.8.1 As an alternative to Pt 3, Ch 9, 4.3 Arrangements and design to Pt 3, Ch 9, 4.7 Deflection, the structure may be designed on the basis of a direct calculation using a grillage idealisation. The method adopted and the stress levels proposed for the material of construction are to be submitted for consideration.

Section 5 Helicopter landing areas

5.1 General

5.1.1 Attention is drawn to the requirements and guidance of National and other Authorities concerning the construction of helicopter landing platforms and the operation of helicopters as they affect the ship. These include SOLAS Reg.II-2/18 and Reg.III/28 as applicable, as well as the *International Chamber of Shipping (ICS) Guide to Helicopter/Ship Operations* and the *International Aeronautical Search and Rescue Manual (IAMSAR)* and *CAP437 Standards for Offshore Helicopter Landing Areas*.

5.1.2 Where the requirements of this Section have been adhered to for a designated helicopter landing platform or other deck area and fire-fighting appliances and other equipment necessary for the safe operation of helicopters are provided, the ship will be eligible for the special features notation **Helideck**. See also SOLAS Reg.II-2/18.

5.1.3 Where the requirements of this Section have been complied with for an area on a ship designated for occasional or emergency landing of helicopters, the ship will be eligible for the special features notation **Occasional Helicopter Landing Area**, see SOLAS Reg.II-2/18.2.2.

5.1.4 The structure is to be designed to accommodate the largest helicopter type which it is intended to use.

5.1.5 Plans are to be submitted showing the proposed scantlings and arrangements of the structure. The type, size, weight and footprint of helicopters to be used are also to be indicated. Details of the helicopter types to be used are to be included in the Loading Manual (see Pt 3, Ch 4, 8.2 Loading Manual)

5.1.6 Where the landing area forms part of a weather or erection deck, the scantlings are to be not less than those required for decks in the same position.

5.2 Symbols

5.2.1 The symbols in this Section are defined in Pt 3, Ch 9, 1.2 Symbols and in the appropriate sub-Section.

5.3 Arrangements

5.3.1 The landing area is to be sufficiently large to allow for the landing and manoeuvring of the helicopter, and is to be approached by a clear landing and take-off sector complying in extent with the applicable Regulations, International Standards, or to the satisfaction of the National Authority.

5.3.2 The landing area is to be free of any projections above the level of the deck. Projections in the zone surrounding the landing area are to be kept below the heights permitted by the Regulations, International Standards, or to the satisfaction of the National Authority.

5.3.3 Suitable arrangements are to be made to minimise the risk of personnel or machinery sliding off the landing area. A non-slip surface and anchoring devices are to be provided.

5.3.4 Engine uptake arrangements are to be sited such that exhaust gases cannot be drawn into helicopter engine intakes during helicopter take off or landing operations.

5.4 Landing area plating

5.4.1 The deck plate thickness, t , within the landing area is to be not less than:

$$t = t_1 + 1,5 \text{ mm}$$

where

$$t_1 = \frac{\alpha s}{1000\sqrt{k}} \text{ mm}$$

α = thickness coefficient obtained from Figure 9.3.1 Tyre print chart

β = tyre print coefficient used in Figure 9.3.1 Tyre print chart

$$= \log_{10} \left(\frac{P_1 k^2}{s^2} \times 10^7 \right)$$

The plating is to be designed for the emergency landing case taking:

$$P_1 = 2,5 \varphi_1 \varphi_2 \varphi_3 f P_w \text{ tonnes}$$

in which $\varphi_1, \varphi_2, \varphi_3$ are to be determined from Table 9.3.1 Deck plate thickness calculation

$f = 1,15$ for landing decks over manned spaces, e.g. deckhouses, bridges, control rooms, etc.

$= 1,0$ elsewhere

P_h = the maximum all-up weight of the helicopter, in tonnes

P_w = landing load on the tyre print in tonnes;

for helicopters with a single main rotor, P_w is to be taken as P_h divided equally between the two main undercarriage wheels

for helicopters with tandem main rotors, P_w is to be taken as P_h distributed between all main undercarriage wheels in proportion to the static loads they carry

For helicopters fitted with landing gear consisting of skids, P_w is to be taken as P_h distributed in accordance with the actual load distribution given by the airframe manufacturer. If this is unknown, P_w is to be taken as $1/6P_h$ for each of the two forward contact points and $1/3P_h$ for each of the two aft contact points. The load may be assumed to act as a 300 mm x 10 mm line load at each end of each skid when applying Figure 9.3.1 Tyre print chart.

γ = a location factor given in Table 9.5.1 Location factor

For wheeled undercarriages, the tyre print dimensions specified by the manufacturer are to be used for the calculation. Where these are unknown, it may be assumed that the print area is 300 x 300 mm and this assumption is to be indicated on the submitted plan.

For skids and tyres with an asymmetric print, the print is to be considered oriented both parallel and perpendicular to the longest edge of the plate panel and the greatest corresponding value of α , taken from Figure 9.3.1 Tyre print chart.

Table 9.5.1: Location factor

Location	γ
On decks forming part of the hull girder	
(a) within 0,4L amidships	0,71 Values for intermediate locations are to be determined by interpolation
(b) at the F.P. or A.P.	0,6 Values for intermediate locations are to be determined by interpolation
Elsewhere	0,6

5.4.2 The plate thickness for aluminium decks is to be not less than:

$$t = 1,4t_1 + 1,5 \text{ mm}$$

where t_1 is the mild steel thickness as determined from Pt 3, Ch 9, 5.4 Landing area plating.

5.5 Deck stiffening and supporting structure

5.5.1 The helicopter deck stiffening and the supporting structure for helicopter platforms are to be designed for the load cases given in Table 9.5.2 Design load cases for deck stiffening and supporting structure in association with the permissible stresses given in Table 9.5.3 Permissible stresses for deck stiffening and supporting structure. The helicopter is to be positioned so as to produce the most severe loading condition for each structural member under consideration.

5.5.2 The minimum moment of inertia, I , of aluminium secondary structure stiffening is to be not less than:

$$I = \frac{5,25}{k_a} Z l_e \text{ cm}^4$$

where Z is the required section modulus of the aluminium stiffener and attached plating and k_a as defined in Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners.

5.5.3 Where a grillage arrangement is adopted for the platform stiffening, it is recommended that direct calculation procedures be used.

5.6 Bimetallic connections

5.6.1 Where aluminium alloy platforms are connected to steel structures, details of the arrangements in way of the bimetallic connections are to be submitted.

Table 9.5.2: Design load cases for deck stiffening and supporting structure

Loadcase	Loads			
	Landing area		Supporting structure (See Note 1)	
	UDL , in kN/m^2 (tonne-f/m ²)	Helicopter patch load (See Note 2)	Self weight	Horizontal load (See Note 2)
(1) Overall distributed loading	2 (0,2)	—	—	—
(2) Helicopter emergency landing	0,5 (0,05)	$2,5P_w f$	W_h	$0,5P_h$
(3) Normal usage	0,5 (0,05)	$1,5P_w$	W_h	$0,5P_h + 0,5W_h$
Symbols				
P_h and P_w as defined in Pt 3, Ch 9, 5.4 Landing area plating UDL = Uniformly distributed vertical load over entire landing area W_h = structural self-weight of helicopter platform				
Note 1. For the design of the supporting structure for helicopter platforms, applicable self weight and horizontal loads are to be added to the landing area loads.				
Note 2. The helicopter is to be so positioned as to produce the most severe loading condition for each structural member under consideration.				

Table 9.5.3: Permissible stresses for deck stiffening and supporting structure

Loadcase (See Table 9.5.2 Design load cases for deck stiffening and supporting structure)	Permissible stresses, in N/mm ² (kgf/mm ²)			
	Deck secondary structure (beams, longitudinals) (See Notes 1 and 2)	Primary structure (transverses, girders, pillars, trusses)	All structure	
	Bending		Combined bending and axial	Shear
(1) Overall distributed load	$\frac{147}{k}$ $\left(\frac{15}{k}\right)$	$\frac{147}{k}$ $\left(\frac{15}{k}\right)$	$0,6 \sigma_c$	
(2) Helicopter emergency landing	$\frac{245}{k}$ $\left(\frac{25}{k}\right)$	$\frac{220,5}{k}$ $\left(\frac{22,5}{k}\right)$	$0,9 \sigma_c$	$\frac{\text{Bending}}{\sqrt{3}}$
(3) Normal usage	$\frac{176}{k}$ $\left(\frac{18}{k}\right)$	$\frac{147}{k}$ $\left(\frac{15}{k}\right)$	$0,6 \sigma_c$	
Symbols				
<p>k = a material factor:</p> <p>= as defined in Pt 3, Ch 9, 1.2 Symbols for steel members</p> <p>= k_a as defined in Pt 3, Ch 9, 4.6 Pontoon webs and stiffeners for aluminium alloy members</p> <p>σ_c = yield stress, 0,2% proof stress or compressive buckling stress, in N/mm² (kgf/mm²), whichever is the lesser</p>				
<p>Note 1. For strength deck longitudinals and girders, the permissible bending stresses are to be reduced as follows:</p> <p>Note (a) within 0,4L of amidships - by 30%</p> <p>Note (b) at the F.P. or A.P. - by 0% Values at intermediate locations are to be determined by interpolation between (a) and (b).</p> <p>Note 2. When determining bending stresses in secondary structure, for compliance with the above permissible stresses, 100% end fixity may be assumed.</p>				

Section 6

Lifting appliances and support arrangements

6.1 General

6.1.1 Masts, derrick posts, crane pedestals and similar supporting structures are classification items, and the scantlings and arrangements are to comply with LR's requirements whether or not LR is also requested to issue the Register of Ships' Cargo Gear and Lifting Appliances.

6.1.2 Where the lifting appliance is considered to be an essential feature of a classed ship, the special feature class notation **LA** will, in general, be mandatory.

6.1.3 Elsewhere, classification of lifting appliances is optional and may be assigned at the request of the Owner on compliance with the appropriate requirements.

6.1.4 Certain movable support structures and lifting appliances on special purpose vessels which are considered an essential feature of the vessel are to be included in the classification of the vessel.

6.1.5 Proposals to class lifting appliances on unclassified ships will be specially considered.

6.2 Masts, derrick posts and crane pedestals

6.2.1 The scantlings of masts and derrick posts, intended to support derrick booms, conveyor arms and similar loads, and of crane pedestals, are to comply with the requirements of LR's *Code for Lifting Appliances in a Marine Environment* (hereinafter referred to as LAME).

6.2.2 In addition to the information and plans requested in LR's LAME the following details are to be submitted:

- (a) Details of masts, derrick posts or crane pedestals, together with details of the attachments to the hull structure.
- (b) Details of any reinforcement or additional supporting material fitted to the hull structure in way of the mast, derrick post or crane pedestal.

6.3 Support Structure for masts, derrick posts and crane pedestals

6.3.1 The requirements of Pt 3, Ch 9, 6.3 Support Structure for masts, derrick posts and crane pedestals and Pt 3, Ch 9, 6.3 Support Structure for masts, derrick posts and crane pedestals are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation, see Pt 1, Ch 2, 2.3 Class notations (hull).

6.3.2 Masts, derrick posts and crane pedestals are to be efficiently supported and, in general, are to be carried through the deck and satisfactorily scarfed into a transverse hold or 'tween deck bulkhead. Alternatively, the masts, derrick posts or crane pedestals may be carried into a mast house, in which case the mast house is to be of substantial construction. Proposals for other support arrangements will be specially considered.

6.3.3 Deck plating and underdeck structure are to be reinforced under masts, derrick posts or crane pedestals and, where the deck is penetrated, the deck plating is to be suitably increased locally.

6.4 Lifting appliances

6.4.1 Ships or offshore units fitted with lifting appliances built in accordance with LR's LAME in respect of structural and machinery requirements will be eligible to be assigned Special Features class notations as listed in Table 9.6.1 Special features class notations associated with lifting appliances. This notation will be retained so long as the appliances are found upon examination at the prescribed surveys to be maintained in accordance with LR's requirements.

Table 9.6.1: Special features class notations associated with lifting appliances

Lifting appliance	Special features class notation	Remarks
Derricks, derrick cranes or cranes on ships	CG	Optional notation. Indicates that the ship's cargo gear is included in class.
Cranes on offshore installations	PC	Optional notation. Indicates that the installation's platform cranes are included in class.

Special Features

Part 3, Chapter 9

Section 7

Lifts and ramps on ships	CL PL CR	Optional notations. Indicate that the ship's cargo lifts (CL), passenger lifts (PL) or cargo ramps (CR) are included in class.
Lifting appliances forming an essential feature of the vessel, e.g. cranes on crane barges or pontoons, lifting arrangements for diving on diving support ships, etc.	LA	Mandatory notation. Indicates that the lifting appliance is included in class.

Section 7 Bottom strengthening for loading and unloading aground

7.1 Application

7.1.1 Where a ship of length, L , less than 90 m has the bottom structure additionally strengthened for loading and unloading aground in accordance with Table 9.7.1 Bottom strengthening for loading and unloading aground, it will be eligible for the special features notation 'bottom strengthened for loading and unloading aground'. Ships of length, L , 90 m or more intended for this service will receive individual consideration.

7.1.2 For dredgers intended to operate aground, the requirements of Pt 4, Ch 12 Dredging and Reclamation Craft are to be applied.

Table 9.7.1: Bottom strengthening for loading and unloading aground

Item	Requirement	
The following requirements are to be applied to the bottom structure upon which the ship is likely to be supported whilst aground		
(1) Bottom shell and keel plating	Thickness to be increased by 20% over the minimum requirements given in Part 4 for the particular type of ship with a minimum of 8 mm	
	For dry cargo ships, as required in way of double bottoms, see item (3)	
(2) Bottom longitudinals in way of single bottoms	For oil tankers, scantlings as required by Table 9.5.1 Values of F1 in Pt 4, Ch 9 in taking $c_1 = 1,0$	
(3) Bottom longitudinals in way of double bottoms, see Note 1	For dry cargo ships, scantlings as required by Table 1.6.1 (a) Shell framing (longitudinal) in Pt 4, Ch 1 in taking $c_1 = 1,0$	
(4) Bilge longitudinals (where fitted)	Scantlings to be the same as bottom longitudinals	
	Transverse framing	Longitudinal framing
(5) Primary stiffening in way of single bottoms, see Notes 2 and 3	(a) Floors to be fitted at every frame with vertical stiffeners spaced, in general, not more than 1,25 m apart (b) One side girder is to be fitted on each side of the centreline in addition to the requirements ofPt 4, Ch 1, 7 Single bottom structure and intermediate 150 x 10 bulb plate longitudinals or equivalent fitted	(a) The arrangements and scantlings will receive individual consideration depending on the structural arrangements of the particular ship type (b) The spacing of transverse or floors is, in general, not to exceed 1,85 m

(6) Primary stiffening in way of double bottoms, see Notes 1, 2 and 3	(a) Plate floors are to be fitted at every frame and vertical stiffening arranged to give panel widths, in general, not exceeding 1,25 m One side girder is to be fitted on each side of the centreline in addition to the requirements of Pt 4, Ch 1, 8 Double bottom structure and intermediate 150 x 10 bulb plate longitudinals or equivalent fitted	(a) The spacing of floors is, in general, not to exceed 1,85 m (b) One side girder is to be fitted on each side of the centreline in addition to the requirements of Pt 4, Ch 1, 8 Double bottom structure
<p>Note 1. For oil tankers, to be specially considered.</p> <p>Note 2. The scantlings of floors, girders and transverses are to be determined from Pt 4 Ship Structures (Ship Types), for the particular ship type.</p> <p>Note 3. The number and sizes of holes in floors, girders and transverses are to be kept to a minimum; see Pt 4, Ch 1, 8 Double bottom structure and Pt 4, Ch 9, 6 Inner hull, inner bottom and longitudinal oiltight bulkheads.</p>		

Section 8 Strengthening for regular discharge by heavy grabs

8.1 Application

8.1.1 For bulk carriers where cargoes are regularly discharged by heavy grabs and the thickness of the plating of the hold inner bottom, hopper and transverse bulkhead bottom stool is increased in accordance with the requirements of this Section, the ship will, at the Owner's option, be assigned the notation 'strengthened for regular discharge by heavy grabs'.

8.1.2 It should be noted that damage to the plating cannot be excluded even when complying with these requirements and can result from the mishandling of the grabs during the discharge of cargo.

8.1.3 The grab weight given in Pt 3, Ch 9, 8.2 Inner bottom plating does not preclude the use of heavier grabs. It is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.

8.1.4 The maximum unladen weight of the grab is to be recorded in the Loading Manual, see also Pt 3, Ch 4, 8.2 Loading Manual.

8.1.5 The requirements in this Section are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation. See Pt 1, Ch 2, 2.3 Class notations (hull).

8.2 Inner bottom plating

8.2.1 The thickness of the inner bottom plating in the holds is to be not less than required by the greater of the following:

$$(a) \quad t = \frac{\left(\log_{10}\left(1,775P\left(\frac{k}{s}\right)^2\right) + 5,7633\right)s - 344,5}{40,875\sqrt{k}} + 1,5 \text{ mm}$$

(b) t = the Rule required thickness, in mm in accordance with Pt 4, Ch 7, 8 Double bottom structure for the intended class notation.

where

P = specified unladen grab weight for the hold, in tonnes, and is not to be taken as less than 25 tonnes

s = spacing of inner bottom longitudinals, in mm

k = higher tensile steel factor as defined in Pt 3, Ch 2, 1.2 Steel.

8.3 Hopper side tank sloped bulkhead plating

8.3.1 The thickness of the sloped bulkhead plating adjacent to the inner bottom knuckle is to be as required by Pt 3, Ch 9, 8.2 Inner bottom plating but based on the actual spacing of stiffeners. The plating of increased thickness is to extend for a minimum distance corresponding to a vertical height of 1,5 m above the line of the inner bottom. Outboard of the plating of increased thickness, the thickness of the adjacent strakes is to be tapered to the Rule thickness for plating, as required by Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening, at the top corner of the tank, see *also* Pt 4, Ch 7, 9.2 Sloped bulkhead plating where, in addition, the 'strengthened for heavy cargo notation' is desired.

8.4 Transverse bulkhead plating

8.4.1 The thickness of the bulkhead or stool plating adjacent to the inner bottom is to be as required by Pt 3, Ch 9, 8.2 Inner bottom plating but based on the actual spacing of the bulkhead or stool stiffeners. The plating of increased thickness is to extend for a minimum distance corresponding to a vertical height of 1,5 m above the line of the inner bottom.

Section

- 1 **General**
- 2 **Welding**
- 3 **Secondary member end connections**
- 4 **Construction details for primary members**
- 5 **Structural details**
- 6 **Access arrangements for oil tankers and bulk carriers**

■ *Section 1* **General**

1.1 Application

1.1.1 This Chapter is applicable to all ship types and components.

1.1.2 Requirements are given in this Chapter for the following:

- (a) Welding-connection details, defined practices and sequence, consumables and equipment, procedures, workmanship and inspection.
- (b) End connection scantlings and constructional details for longitudinals, beams, frames and bulkhead stiffeners.
- (c) Primary member proportions, stiffening and construction details.

Additional requirements for primary structure of tankers and similar ships are given in Pt 4, Ch 9, 6 Inner hull, inner bottom and longitudinal oiltight bulkheads.

1.1.3 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a CSR notation (see Pt 1, Ch 2, 2.3 Class notations (hull)) with the exception of Pt 3, Ch 10, 2.5 Welding equipment which are to be complied with.

1.2 Symbols

1.2.1 Symbols are defined as necessary in each Section.

1.2.2 The Notation **ESP** serves to identify the ships as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 7 Special Survey - Oil tankers (including ore/oil ships and ore/bulk/oil ships) - Hull requirements, see also Pt 1, Ch 2, 2 Character of classification and class notations.

■ *Section 2* **Welding**

2.1 General

2.1.1 The plans to be submitted for approval are to indicate clearly details of the welded connections of main structural members, including the type and size of welds. This requirement includes welded connections to steel castings.

The information to be submitted should include the following:

- (a) Whether weld sizes given are throat thicknesses or leg lengths.
- (b) Grades and thicknesses of materials to be welded.
- (c) Location, types of joints and angles of abutting members.
- (d) Reference to welding procedures to be used.
- (e) Sequence of welding of assemblies and joining up of assemblies.

2.1.2 Unless otherwise indicated, all welding is to be in accordance with the requirements of Ch 13 Requirements for Welded Construction of the Rules for Materials.

2.2 Fillet welds

2.2.1 The throat thickness of fillet welds is to be determined from:

$$\frac{\text{Throat thickness}}{s} = t_p \times \text{weld factor} \times \frac{d}{s}$$

where

d = the distance between start positions of successive weld fillet, in mm

s = the length, in mm, of correctly proportioned weld fillet, clear of end craters, and is to be not less than 75 mm

t_p = plate thickness, on which weld fillet size is based, in mm

see also Figure 10.2.1 Weld dimensions and types

Weld factors are given in Table 10.2.1 Weld factors, Table 10.2.3 Connections of primary structure and Table 10.2.4 Secondary member end connection welds.

Figure 10.2.1: Weld dimensions and types

2.2.2 Where double continuous fillet welding is proposed, the throat thickness is to be determined taking $\left(\frac{d}{s}\right)$ equal to 1.0.

2.2.3 The leg length of the weld is to be not less than $\sqrt{2}$ times the specified throat thickness.

2.2.4 The plate thickness, t_p , to be used in the above calculation is generally to be that of the thinner of the two parts being joined. Where the difference in thickness is considerable, the size of fillet will be considered.

2.2.5 Where the thickness of the abutting member of the connection (e.g. the web of a stiffener) is greater than 15 mm and exceeds the thickness of the table member (e.g. plating), the welding is to be double continuous and the throat thickness of the weld is to be not less than the greatest of the following:

Welding and Structural Details

Part 3, Chapter 10

Section 2

- (a) $0,21 \times$ thickness of the table member. The table member thickness used need not exceed 25mm.
 (b) $0,21$ ($0,27$ in tanks) \times half the thickness of the abutting member.
 (c) As required by Table 10.2.2 Throat thickness limits.

2.2.6 Except as permitted by Pt 3, Ch 10, 2.2 Fillet welds, the throat thickness of the weld is not to be outside the limits specified in Table 10.2.2 Throat thickness limits.

Table 10.2.1: Weld factors

Item	Weld factor	Remarks
(1) General application:		except as required below
Watertight plate boundaries	0,34	
Non-tight plate boundaries	0,13	
	0,10	
Longitudinals, frames, beams, and other secondary members to shell, deck or bulkhead plating	0,13	in tanks
	0,21	in way of end connections
Panel stiffeners, etc.	0,10	
Overlap welds generally	0,27	
Longitudinals of the flat-bar type to plating		see Note 5
(2) Bottom construction in way of holds or tanks:		
Non-tight centre girder: to keel	0,27	
to inner bottom	0,21	no scallops
	0,21	in way of $0,2 \times$ span at ends
Non-tight boundaries of floors, girders and brackets	0,27	in way of brackets at lower end of main frame
Inner bottom longitudinals or reverse frames	0,13	under holds strengthened for heavy cargoes
		Weld size based on floor thickness
Connection of floors to inner bottom in way of plane bulkheads, bulkhead stools, or corrugated and double plate bulkheads supported on inner bottom. The supporting floors are to be continuously welded to the inner bottom	0,44	Weld material compatible with floor material see Note 4
(3) Hull framing;		
Webs of web frames and stringers:		
to shell	0,16	
to face plate	0,13	
Tank side brackets to shell and inner bottom	0,34	
(4) Decks and supporting structure:		
Strength deck plating to shell		as shown in Table 10.2.5 Weld connection of strength deck plating to sheerstrake but alternative proposals will be considered
Other decks to shell and bulkheads (except where forming tank boundaries)	0,21	generally continuous
Webs of cantilevers to deck and to shell in way of root bracket	0,44

	Rings for manhole type covers, to deck or bulkhead	0,34	Load Line Positions 1 and 2 elsewhere
	Frames of shell and weathertight bulkhead doors	0,34	
	Stiffening of doors	0,21	
	Ventilator, air pipe, etc. coamings to deck	0,34	
		0,21	
	Ventilator, etc. fittings	0,21	full penetration welding may be required
	Scuppers and discharges, to deck	0,44	
	Masts, derrick posts, crane pedestals, etc. to deck	0,44	

Welding and Structural Details

Part 3, Chapter 10

Section 2

Deck machinery seats to deck	0,21	generally
Mooring equipment seats	0,21	generally, but increased or full penetration welding may be required
Bulwark stays to deck	0,21	
Bulwark attachment to deck	0,34	
Guard rails, stanchions, etc. to deck	0,34	
Bilge keel ground bars to shell	0,34	Continuous fillet weld, minimum throat thickness 4 mm
Bilge keels to ground bars	0,21	Light continuous fillet weld, minimum throat thickness 3 mm
Fabricated anchors	full penetration	

Note 1. Where pillars are fitted inside tanks or under watertight flats, the end connection is to be such that the tensile stress in the weld does not exceed 108 N/mm² (11 kgf/mm²).

Note 2. t_p need not be taken greater than the thickness determined from item 1(a) or 1(b) and Notes, as appropriate, of Table 9.6.1 Inner hull and longitudinal oiltight bulkhead scantlings in Pt 4, Ch 9 Double Hull Oil Tankers, but in no case is the weld throat thickness to be less than 0,34 x actual plate thickness.

Note 3. t_p need not be taken greater than the Rule thickness determined from Table 9.7.1 Transverse oiltight bulkhead scantlings of Pt 4, Ch 9 Double Hull Oil Tankers for stiffener spacing of 760 mm, but in no case is the weld throat thickness to be less than 0,34 x actual plate thickness.

Note 4. In way of bulkhead stools in ballast holds of bulk carriers or in tanks at longitudinal girder/transverse floor intersection, cut-outs are to be omitted and full penetration welding is to be applied to both floor and girder for a distance of 150 mm on either side of intersection.

Note 5. The throat thickness of the weld is to be determined by Pt 3, Ch 10, 2.2 Fillet welds. For longitudinals within $D/4$ of the strength deck and with a thickness less than 100 mm, the throat thickness need not exceed 5,5 mm.

2.2.7 Double continuous fillet welding is to be adopted in the following locations, and may be used elsewhere if desired:

- Boundaries of weathertight decks and erections, including hatch coamings, companionways and other openings.
- Boundaries of tanks and watertight compartments.
- All structure in the after peak and the after peak bulkhead stiffeners.
- All welding inside tanks intended for chemicals or edible liquid cargoes.
- All lap welds in tanks.
- Primary and secondary members to bottom shell in the 0,3L forward.
- Primary and secondary members to plating in way of end connections, and end brackets to plating in the case of lap connections.
- Where Pt 3, Ch 10, 2.2 Fillet welds applies.
- All water ballast tanks.
- Other connections or attachments, where considered necessary, and in particular the attachment of minor fittings to higher tensile steel plating.

2.2.8 Where intermittent welding is used, the welding is to be made double continuous in way of brackets, lugs and scallops and at the orthogonal connections with other members.

2.2.9 As an alternative to intermittent welding, single sided welding may be used. Only mechanised single sided welding is acceptable although manual single sided welding may be used at non-critical locations e.g. deck house stiffeners. Where single sided welding is used, the welding is to be made double continuous in way of brackets, lugs and scallops and at the orthogonal connections with other members.

2.2.10 Where structural members pass through the boundary of a tank, and leakage into the adjacent space could be hazardous or undesirable, full penetration welding is to be adopted for the members for at least 150 mm on each side of the

boundary. Alternatively a small scallop of suitable shape may be cut in the member close to the boundary outside the compartment, and carefully welded all round.

2.3 Welding of primary structure

2.3.1 Weld factors for the connections of primary structure are given in Table 10.2.3 Connections of primary structure.

Table 10.2.2: Throat thickness limits

Item	Throat thickness, in mm	
	Minimum	Maximum
(1) Double continuous welding	$0,21t_p$	$0,44t_p$
(2) Intermittent welding	$0,27t_p$	$0,44t_p$ or 4,5
(3) All welds, overriding minimum:		
(a) Plate thickness $t_p \leq 7,5$ mm		
Hand or automatic welding	3,0	—
Automatic deep penetration welding	3,0	—
(b) Plate thickness $t_p > 7,5$ mm		
Hand or automatic welding	3,25	—
Automatic deep penetration welding	3,0	—
<p>Note 1. In all cases, the limiting value is to be taken as the greatest of the applicable values given above.</p> <p>Note 2. Where t_p exceeds 25 mm, the limiting values may be calculated using a notional thickness equal to $0,4(t_p + 25)$ mm.</p> <p>Note 3. The maximum throat thicknesses shown are intended only as a design limit for the approval of fillet welded joints. Any welding in excess of these limits is to be to the Surveyor's satisfaction.</p>		

2.3.2 The weld connection to shell, deck or bulkhead is to take account of the material lost in the notch where longitudinals or stiffeners pass through the member. Where the width of notch exceeds 15 per cent of the stiffener spacing, the weld factor is to be multiplied by:

$$\frac{0,85 \times \text{stiffener spacing}}{\text{length of web plating between notches}}$$

2.3.3 Where direct calculation procedures have been adopted, the weld factors for the 0,2 x overall length at the ends of the members will be considered in relation to the calculated loads.

2.3.4 The throat thickness limits given in Table 10.2.2 Throat thickness limits are to be complied with.

2.4 Welding of primary and secondary member end connections

2.4.1 Welding of end connections of primary members is to be such that the area of welding is not less than the cross-sectional area of the member, and the weld factor is to be not less than 0,34 in tanks or 0,27 elsewhere.

2.4.2 The welding of secondary member end connections is to be not less than as required by Table 10.2.4 Secondary member end connection welds. Where two requirements are given the greater is to be complied with.

2.4.3 The area of weld, A_w , is to be applied to each arm of the bracket or lapped connection.

Welding and Structural Details

Part 3, Chapter 10

Section 2

Table 10.2.3: Connections of primary structure

Primary member face area, in cm ²		Position ⁽¹⁾	Weld factor			
Exceeding	Not exceeding		In tanks		In dry spaces	
			To face plate	To plating	To face plate	To plating
	30,0	At ends	0,21	0,27	0,21	0,21
		Remainder	0,10	0,16	0,10	0,13
30,0	65,0	At ends	0,21	0,34	0,21	0,21
		Remainder	0,13	0,27	0,13	0,16
65,0	95,0	At ends	0,34	0,44 ⁽³⁾	0,21	0,27
		Remainder	0,27 ⁽²⁾	0,34	0,16	0,21
95,0	130,0	At ends	0,34	0,44 ⁽³⁾	0,27	0,34
		Remainder	0,27 ⁽²⁾	0,34	0,21	0,27
130,0		At ends	0,44	0,44 ⁽³⁾	0,34	0,44 ⁽³⁾
		Remainder	0,34	0,34	0,27	0,34

Note 1. The weld factors 'at ends' are to be applied for 0,2 x the overall length of the member from each end, but at least beyond the toes of the member end brackets. On vertical webs the increased welding may be omitted at the top, but is to extend at least 0,3 x overall length from the bottom.

Note 2. Weld factor 0,34 in cargo oil tanks.

Note 3. Where the web plate thickness is increased locally, the weld size may be based on the thickness clear of the increase, but is to be not less than 0,34 x the increased thickness.

Note 4. In tankers over 122 m in length, the weld factor of the connection of bottom transverses to shell, and of side transverses to shell and vertical webs to longitudinal and transverse bulkheads all in the lower half depth, is to be not less than 0,34.

Note 5. The final throat thickness of the weld fillet to be not less than 0,34t_p in cargo oil tanks.

Table 10.2.4: Secondary member end connection welds

Connection	Weld area, A _w , in cm ²	Weld factor
(1) Stiffener welded direct to plating	0,25A _s or 6,5 cm ² whichever is the greater	0,34
(2) Bracketless connection of stiffeners or stiffener lapped to bracket or bracket lapped to stiffener:		
(a) in dry space	1,2√Z	0,27
(b) in tank	1,4√Z	0,34
(c) main frame to tank side bracket in 0,15L forward	as (a) or (b)	0,34
(3) Bracket welded to face of stiffener and bracket connection to plating	—	0,34
(4) Stiffener to plating for 0,1 x span at ends, or in way of end bracket if that be greater	—	0,34
Symbols		

A_s = cross sectional area of the stiffener, in cm^2

A_w = the area of the weld, in cm^2 , and is calculated as total length of weld, in cm, x throat thickness, in cm

Z = the section modulus, in cm^2 , of the stiffener on which the scantlings of the bracket are based, see Pt 3, Ch 10, 3 Secondary member end connections

Note For maximum and minimum weld fillet sizes, see Table 10.2.2 Throat thickness limits

Table 10.2.5: Weld connection of strength deck plating to sheerstrake

Item	Stringer plate thickness, mm	Weld type
1	$t \leq 15$	Double continuous fillet weld with a weld factor of 0,44
2	$15 < t \leq 20$	Single vee preparation to provide included angle of 50° with root $R \leq \frac{1}{3} t$ in conjunction with a continuous fillet weld having a weld factor of 0,39; or Double vee preparation to provide included angles of 50° with root $R \leq \frac{1}{3} t$
3	$t > 20$	Double vee preparation to provided included angles of 50° with root $R \leq \frac{1}{3} t$ but not to exceed 10 mm

Note 1. Welding procedure, including joint preparation, is to be specified. Procedure is to be qualified and approved for individual Builders.

Note 2. See also Pt 3, Ch 10, 2.2 Fillet welds:

Note 3. For thickness t in excess of 20 mm the stringer plate may be bevelled to achieve a reduced thickness at the weld connection. The length of the bevel is in general to be based on a taper not exceeding 1 in 3 and the reduced thickness is in general to be not less than 0,65 times the thickness of stringer plate or 20 mm, whichever is the greater.

Note 4. Alternative connections will be considered.

2.4.4 Where a longitudinal strength member is cut at a primary support and the continuity of strength is provided by brackets, the area of weld is to be not less than the cross-sectional area of the member.

2.4.5 Where the secondary member passes through, and is supported by, the web of a primary member, the weld connection is to be in accordance with the following:

(a) In strengthening of bottom forward region:

Comply with the requirements of Pt 3, Ch 5, 1.5 Strengthening of bottom forward.

(b) Elsewhere:

Comply with the requirements of Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members.

2.4.6 The throat thickness limits given in Table 10.2.2 Throat thickness limits are to be complied with.

2.5 Welding equipment

2.5.1 Welding plant and equipment are to be in accordance with the requirements specified in Ch 13, 1.8 Welding equipment and welding consumables of the Rules for Materials.

2.6 Welding consumables and equipment

2.6.1 Welding consumables used and associated equipment is to be in accordance with the requirements specified in Ch 13, 1.8 Welding equipment and welding consumables of the Rules for Materials.

2.7 Welding procedures and welder qualifications

2.7.1 Welding procedures are to be established for the welding of all joints in accordance with the requirements specified in Ch 13, 1.9 Welding procedure and welder qualifications of the Rules for Materials.

2.7.2 All welding procedures are to be tested and qualified in accordance with the requirements of Ch 12 Welding Qualifications of the Rules for Materials and are to be approved by the Surveyor prior to construction.

2.7.3 Welders and welding operators are to be proficient in the type of work to be undertaken and are to be qualified in accordance with the requirements specified in Ch 12 Welding Qualifications of the Rules for Materials.

2.8 Workmanship and shipyard practice

2.8.1 A sufficient number of skilled supervisors is to be provided to ensure an effective and systematic control at all stages of welding operations.

2.9 Inspection of welds

2.9.1 Effective arrangements are to be provided by the Shipbuilder for the inspection of finished welds to ensure that all welding has been satisfactorily completed.

2.9.2 All finished welds are to be subjected to non-destructive examination by personnel designated by the Builder in accordance with the requirements specified in Ch 13, 2.12 Non-destructive examination of welds of the Rules for Materials.

2.9.3 In addition to the requirements of Pt 3, Ch 10, 2.9 Inspection of welds, a number of checkpoints are to be examined by volumetric examination as detailed in Pt 3, Ch 10, 2.9 Inspection of welds to Pt 3, Ch 10, 2.9 Inspection of welds.

2.9.4 Typical locations and number of checkpoints to be taken are shown in Table 10.2.6 Checkpoint locations. Critical locations as identified by *ShipRight FDA Procedure* (see Pt 3, Ch 16 ShipRight Procedures for the Design, Construction and Lifetime Care of Ships) are also to be considered. A plan of the proposed checkpoint locations is to be submitted for approval.

Table 10.2.6: Checkpoint locations

Item	Location	Checkpoints
Intersections of butts and seams of fabrication and section welds	Throughout: (a) hull envelope, shell envelope and deck structure plating: <ul style="list-style-type: none"> at highly stressed areas, see Note 1 remainder (b) longitudinal and transverse bulkheads (c) inner bottom and hopper plating:	all 1 in 2 1 in 2 1 in 2
SDA/FDA	At critical locations identified by SDA or FDA, see Note 2	all
Butt welds in plating	Throughout	1 m in 25 m, see Notes 3 and 4
Seam welds in plating	Throughout	1 m in 100 m

Welding and Structural Details

Part 3, Chapter 10

Section 2

Butt welds in longitudinals	Hull envelope within 0,4L amidships	1 in 10 welds, see Note 5
	Hull envelope outside 0,4L amidships	1 in 20 welds
Bilge keel butt welds	Within 0,4L amidships	all
	Remainder	1 in 3
Structural items when made with full penetration welding as follows:	Throughout	
	• connection of stool and bulkhead to lower stool shelf plating	1 m in 20 m
	• vertical corrugations to an inner bottom	1 m in 20 m
	• hopper knuckles	1 m in 10 m
	• sheerstrake to deck stringer	1 m in 20 m
	• hatchways coaming to deck	1 m in 40 m
	Hatchway ends within 0,4L amidships	all
	Hatchway ends outside 0,4L amidships	1 in 2
	Remainder	1 in 40 m
<p>Note 1. Typically those at sheerstrake, deck stringer, keel strake and turn of bilge.</p> <p>Note 2. SDA signifies the <i>ShipRight Structural Design Assessment Procedure</i>, FDA signifies the <i>ShipRight Fatigue Design Assessment Procedure</i>.</p> <p>Note 3. Checkpoints in butt welds and seam welds are in addition to those at intersections.</p> <p>Note 4. Welds at inserts used to close openings in hull envelope plating are to be checked by non-destructive examination.</p> <p>Note 5. Particular attention is to be given to repair rates in butt welds in longitudinals. Additional welds are to be tested if defects such as lack of fusion or incomplete penetration are observed in more than 10 per cent of the welds examined.</p>		

2.9.5 Checkpoints are not to be identified on the ship's structural components prior to the welding taking place. Special treatment is not to be given at these locations except critical locations as identified by *ShipRight FDA Procedure*.

2.9.6 For ultrasonic examination the length of each checkpoint is to be 0,5 m and for radiographic examination the length is to be a minimum of 0,3 m. At weld intersections, examination is to be in both weld directions.

2.9.7 The Builder is to provide the Surveyor with all the NDE reports of the checkpoints. These reports are to be available for the Surveyor to review within a short time after inspection, normally considered to be within 10 working days of the examination being carried out. Where welds are repaired the NDE report is to include details of examination of both the defective weld and of the re-weld.

2.9.8 Where the Surveyor notes that a checkpoint has been repaired without record of the original defect, the shipyard is to carry out additional examinations on additional lengths of weld. These lengths are to be adjacent to and on both sides of the defective checkpoint. These additional examinations are to be carried out in the presence of the Surveyor and reported in accordance with Pt 3, Ch 10, 2.9 Inspection of welds.

2.9.9 Where checkpoints are found to contain continuous or semi-continuous defects, additional lengths of weld adjacent to and on both sides of the defective length are to be subject to further volumetric examination. The NDE reports are to be submitted in accordance with Pt 3, Ch 10, 2.9 Inspection of welds.

2.9.10 The following non-destructive examination is to be carried out on ships to be assigned the class notation '**Chemical tanker**':

- (a) All crossings of butts and seams of cargo tank bulkhead plating which are welded in assembly areas or on the berth.

- (b) Where cargo tank boundary welding is completed in assembly areas or on the berth, a minimum of 10 per cent of the total weld length is to be crack detected.
- (c) Where side and bottom longitudinal framing and longitudinal stiffeners terminate at transverse bulkheads, a minimum of 10 per cent of the bulkhead boundary connections is to be crack detected in addition to the requirement given in Pt 3, Ch 10, 2.9 Inspection of welds.
- (d) Where longitudinal framing and longitudinal bulkhead stiffeners are continuous through transverse bulkheads, 30 per cent each of the bottom and shipside boundaries and 20 per cent of the longitudinal bulkhead boundaries are to be crack detected in addition to the requirement given in Pt 3, Ch 10, 2.9 Inspection of welds.
- (e) Where transverse framing members are continuous through the cargo tank boundary, a minimum of 10 per cent of boundary connections is to be crack detected.

■ *Section 3*

Secondary member end connections

3.1 General

3.1.1 Secondary members, that is longitudinals, beams, frames and bulkhead stiffeners forming part of the hull structure, are generally to be connected at their ends in accordance with the requirements of this Section. Where it is desired to adopt bracketless connections, the proposed arrangements will be individually considered.

3.1.2 Where end connections are fitted in accordance with these requirements, they may be taken into account in determining the effective span of the member.

3.1.3 Where the section modulus of the secondary member on which the bracket is based (see Pt 3, Ch 10, 3.3 Basis for calculation) exceeds 2000 cm³, the scantlings of the connection will be considered.

3.2 Symbols

3.2.1 The symbols used in this Section are defined as follows:

a, b = the actual lengths of the two arms of the bracket, in mm, measured from the plating to the toe of the bracket

b_f = the breadth of the flange, in mm

t = the thickness of the bracket, in mm

Z = the section modulus of the secondary member, in cm³.

3.3 Basis for calculation

3.3.1 Where a longitudinal strength member is cut at a primary support and the continuity of strength is provided by brackets, the scantlings of the brackets are to be such that their section modulus and effective cross-sectional area are not less than those of the member. Care is to be taken to ensure correct alignment of the brackets on each side of the primary member.

3.3.2 In other cases the scantlings of the bracket are to be based on the modulus as follows:

(a) Bracket connecting stiffener to primary member:

modulus of the stiffener.

(b) Bracket at the head of a main transverse frame where frame terminates:

modulus of the frame.

(c) Brackets connecting lower deck beams or longitudinals to the main frame in the forward 0,15L:

modulus of the frame.

(d) Elsewhere: the lesser modulus of the members being connected by the bracket.

3.3.3 Typical arrangements of stiffener end brackets are shown diagrammatically in Figure 10.3.1 Diagrammatic arrangements of stiffener end brackets.

3.4 Scantlings of end brackets

3.4.1 The lengths, a and b , of the arms are to be measured from the plating to the toe of the bracket and are to be such that:

- (a) $a + b \geq 2,0 l$
- (b) $a \geq 0,8 l$
- (c) $b \geq 0,8 l$

where

$$l = 90 \left(2 \sqrt{\frac{Z}{14 + \sqrt{Z}}} - 1 \right) \text{mm}$$

but in no case is l to be taken as less than twice the web depth of the stiffener on which the bracket scantlings are to be based.

The scantlings of main frames are normally to be based on these standard brackets at top and bottom, while the scantlings of tween deck frames are normally to be based on a standard bracket at the top only. Where the actual arm lengths fitted, a_1 and b_1 (in mm) are smaller than Rule size, or bracket is omitted, an equivalent arm length, l_a , for the calculation of end connection factor, see Table 1.6.3 Shell framing (transverse), is to be derived from:

$$(d) \quad l_a = \frac{(a_1 + b_1)}{2}$$

$$(e) \quad a_1 \geq 0,8 l_a$$

$$(f) \quad b_1 \geq 0,8 l_a$$

$$(g) \quad l_a = 0, \text{ where:}$$

- (i) bracket is omitted from the upper or lower ends of the frame, or
- (ii) lower frame bracket at bilge is at same level as the inner bottom, or
- (iii) lower frame is welded directly to the inner bottom.

3.4.2 The length of arm of tank side and hopper side brackets is to be not less than 20 per cent greater than that required above.

3.4.3 The thickness of the bracket is to be not less than as required by Table 10.3.1 Thickness of brackets.

3.4.4 The free edge of the bracket is to be stiffened where any of the following apply:

- (a) The section modulus, Z , exceeds 2000 cm^3 .
- (b) The length of free edge exceeds $50t \text{ mm}$.
- (c) The bracket is fitted at the lower end of main transverse side framing.

3.4.5 Where a flange is fitted, its breadth is to be not less than:

$$b_f = 40 \left(1 + \frac{Z}{1000} \right) \text{mm}$$

= but not less than 50 mm

3.4.6 Where the edge is stiffened by a welded face flat, the cross-sectional area of the face flat is to be not less than:

- (a) $0,009b_f t \text{ cm}^2$ for offset edge stiffening.
- (b) $0,014b_f t \text{ cm}^2$ for symmetrically placed stiffening.

Table 10.3.1: Thickness of brackets

Bracket	Thickness, in mm	Limits	
		Minimum	Maximum
With edge stiffened:			
(a) in dry spaces	$3,5 + 0,25\sqrt{Z}$	6,5	12,5
(b) in tanks	$4,5 + 0,25\sqrt{Z}$	7,5 See Note	13,5
Unstiffened brackets:		7,5	–
(a) in dry spaces	$5,5 + \frac{Z}{55} - \left(\frac{Z}{168}\right)^{1,3}$	8,5 See Note	–
(b) in tanks	$6,5 + \frac{Z}{55} - \left(\frac{Z}{168}\right)^{1,3}$		
Note In the cargo tank region of tankers, the minimum thickness is to be not less than the compartment minimum thickness, see Pt 4, Ch 9, 10 Construction details and minimum thickness.			

3.4.7 Where the stiffening member is lapped on to the bracket, the length of overlap is to be adequate to provide for the required area of welding. In general, the length of overlap should be not less than $10\sqrt{Z}$ mm, or the depth of stiffener, whichever is the greater.

3.4.8 Where the free edge of the bracket is hollowed out, it is to be stiffened or increased in size to ensure that the modulus of the bracket through the throat is not less than that of the required straight edged bracket.

3.5 Arrangements and details

3.5.1 The arrangement of the connection between the stiffener and the bracket is to be such that at no point in the connection is the modulus reduced to less than that of the stiffener with associated plating.

3.5.2 The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint.

3.5.3 For arrangements where end brackets are not perpendicular to the adjacent plating the strength of the brackets, in terms of lateral stability, may need to be specially considered.

■ **Section 4** **Construction details for primary members**

4.1 General

4.1.1 The requirements for section modulus and inertia (if applicable) of primary members are given in the appropriate Chapter. This Section includes the requirements for proportions, stiffening and construction details for primary members in dry spaces and in tanks of all ship types other than tankers.

4.1.2 The requirements for construction details for the primary structure of tankers are given in Pt 4, Ch 9, 10 Construction details and minimum thickness.

4.1.3 The requirements of this Section may be modified where direct calculation procedures are adopted to analyse the stress distribution in the primary structure.

4.2 Symbols

4.2.1 The symbols used in this Section are defined as follows:

d_w = depth of member web, in mm

k_L, k = higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel

t_w = thickness of member web, in mm

A_f = area of member face plate or flange, in cm²

F_D = local scantlings reduction factor as defined in Pt 3, Ch 4, 5.6 Permissible hull vertical bending stresses

S_w = spacing of stiffeners on member web, or depth of unstiffened web, in mm.

4.3 Arrangements

4.3.1 Primary members are to be so arranged as to ensure effective continuity of strength, and abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead, or on other members, arrangements are to be made to ensure that they are in alignment. Primary members in tanks are to form a continuous line of support and wherever possible, a complete ring system.

4.3.2 The members are to have adequate lateral stability and web stiffening and the structure is to be arranged to minimise hard spots and other sources of stress concentration. Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the panel.

4.3.3 Primary members are to be provided with adequate end fixity by end brackets or equivalent structure. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint and effective distribution of the load from the member.

4.3.4 Where the primary member is supported by structure which provides only a low degree of restraint against rotation, the member is generally to be extended for at least two frame spaces, or equivalent, beyond the point of support before being tapered.

4.3.5 Where primary members are subject to concentrated loads, particularly if these are out of line with the member web, additional strengthening may be required.

4.4 Geometric properties and proportions

4.4.1 The geometric properties of the members are to be calculated in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3, 3.2 Geometric properties of section.

4.4.2 The minimum thickness or area of material in each component part of the primary member is given in Table 10.4.1 Minimum thickness of primary members.

4.4.3 Primary members constructed of higher tensile steel are to comply with Table 10.4.1 Minimum thickness of primary members.

Table 10.4.1: Minimum thickness of primary members

Item	Requirement
(1) Member web plates see Note	$t_w = 0,01S_w$ but not less than 7 mm in dry spaces and not less than 8 mm in tanks
(2) Member face plate	A_f not to exceed $\frac{d_w t_w}{150} \text{ cm}^2$
(3) Deck plating forming the upper flange of underdeck girders	Plate thickness not less than $\sqrt{\frac{A_f}{1,8k}} \text{ mm}$, and 10 per cent greater for hatch side girders Width of plate not less than 700 mm
(4) Primary members in cargo oil tanks in tankers	As required by Pt 4, Ch 9, 10 Construction details and minimum thickness
<p>NOTE</p> <p>For primary members having a web depth exceeding 1500 mm, the arrangement of stiffeners will be individually considered, and stiffening parallel to the member face plate may be required.</p>	

4.5 Web stability

4.5.1 Primary members of asymmetrical section are to be supported by tripping brackets at alternate secondary members. If the section is symmetrical, the tripping brackets may be four spaces apart.

4.5.2 Tripping brackets are also to be fitted at the toes of end brackets and in way of heavy or concentrated loads such as the heels of pillars.

4.5.3 Where the ratio of unsupported width of face plate (or flange) to its thickness exceeds 16:1, the tripping brackets are to be connected to the face plate and on members of symmetrical section, the brackets are to be fitted on both sides of the web.

4.5.4 Intermediate secondary members may be welded directly to the web or connected by lugs.

4.5.5 Where the depth of web of a longitudinal girder at the strength deck within 0,4L amidships exceeds:

(a) $55t_w$ for mild steel members

(b) $55t_w \sqrt{\frac{k_L}{F_D}}$ for higher tensile steel members

additional longitudinal web stiffeners are to be fitted at a spacing not exceeding the value given in (a) or (b) as appropriate, with a maximum of $65t_w \sqrt{k_L}$ for higher tensile steel members. In cases where this spacing is exceeded, the web thickness is, in general, to be suitably increased.

4.5.6 The arm length of unstiffened end brackets is not to exceed $100t_w$. Stiffeners parallel to the bracket face plate are to be fitted where necessary to ensure that this limit is not exceeded.

4.5.7 Web stiffeners may be flat bars of thickness t_w and depth $0,1d_w$, or 50 mm, whichever is the greater. Alternative sections of equivalent moment of inertia may be adopted.

4.6 Openings in the web

4.6.1 Where openings are cut in the web, the depth of opening is not to exceed 25 per cent of the web depth, and the opening is to be so located that the edges are not less than 40 per cent of the web depth from the face plate. The length of opening is not to exceed the web depth or 60 per cent of the secondary member spacing, whichever is the greater, and the ends of the openings are to be equidistant from the corners of cut-outs for secondary members. Where larger openings are proposed, the arrangements and compensation required will be considered.

4.6.2 Openings are to have smooth edges and well rounded corners.

4.6.3 Cut-outs for the passage of secondary members are to be designed to minimise the creation of stress concentrations. The breadth of cut-out is to be kept as small as practicable and the top edge is to be rounded, or the corner radii made as large as practicable. The extent of direct connection of the web plating, or the scantlings of lugs or collars, is to be sufficient for the load to be transmitted from the secondary member.

4.7 End connections

4.7.1 End connections of primary members are generally to comply with the requirements of Pt 3, Ch 10, 3 Secondary member end connections, taking Z as the section modulus of the primary member.

4.7.2 The thickness of the bracket is to be not less than that of the primary member web. The free edge of the bracket is to be stiffened.

4.7.3 Where a deck girder or transverse is connected to a vertical member on the shell or bulkhead, the scantlings of the latter may be required to be increased to provide adequate stiffness to resist rotation of the joint.

4.7.4 Where a member is continued over a point of support, such as a pillar or pillar bulkhead stiffener, the design of the end connection is to be such as to ensure the effective distribution of the load into the support. Proposals to fit brackets of reduced scantlings, or alternative arrangements, will be considered.

4.7.5 Connections between primary members forming a ring system are to minimise stress concentrations at the junctions. Integral brackets are generally to be radiused or well rounded at their toes. The arm length of the bracket, measured from the face of the member, is to be not less than the depth of the smaller member forming the connection.

■ Section 5 Structural details

5.1 Continuity and alignment

5.1.1 The arrangement of material is to be such as will ensure structural continuity. Abrupt changes of shape or section, sharp corners and points of stress concentration are to be avoided.

5.1.2 Where members abut on both sides of a bulkhead or similar structure, care is to be taken to ensure good alignment.

5.1.3 Pillars and pillar bulkheads are to be fitted in the same vertical line wherever possible, and elsewhere arrangements are to be made to transmit the out of line forces satisfactorily. The load at head and heel of pillars is to be effectively distributed and arrangements are to be made to ensure the adequacy and lateral stability of the supporting members.

5.1.4 Continuity is to be maintained where primary members intersect and where the members are of the same depth, a suitable gusset plate is to be fitted.

5.1.5 End connections of structural members are to provide adequate end fixity and effective distribution of the load into the supporting structure.

5.1.6 The toes of brackets, etc. should not land on unstiffened panels of plating. Special care should be taken to avoid notch effects at the toes of brackets, by making the toe concave or otherwise tapering it off.

5.1.7 Where primary and/or secondary members are constructed of higher tensile steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations. Sniped face plates which are welded onto the edge of primary member brackets are to be carried well around the radiused bracket toe and are to incorporate a taper not exceeding 1 in 3. Where sniped face plates are welded adjacent to the edge of primary member brackets, adequate cross sectional area is to be provided through the bracket toe at the end of the snipe. In general, this area measured perpendicular to the face plate, is to be not less than 60 per cent of the full cross-sectional area of the face plate, see Figure 10.5.1 Bracket toe construction. See also Pt 4, Ch 1, 4.3 Deck stiffening, Pt 4, Ch 1, 6.1 General, Pt 4, Ch 9, 5.7 Connections of longitudinals and Pt 4, Ch 9, 10.13 Brackets connecting primary members.

Figure 10.5.1: Bracket toe construction

5.2 Arrangements at intersections of continuous secondary and primary members

5.2.1 Cut-outs for the passage of secondary members through the web of primary members, and the related collaring arrangements, are to be designed to minimise stress concentrations around the perimeter of the opening and in the attached hull envelope or bulkhead plating. The critical shear buckling stress of the panel in which the cut-out is made is to be investigated. Cut-outs for longitudinals will be required to have double lugs in areas of high stress, e.g. in way of cross tie ends and floors under bulkhead stools in ore and ballast holds.

5.2.2 Cut-outs are to have smooth edges, and the corner radii are to be as large as practicable, with a minimum of 20 per cent of the breadth of the cut-out or 25 mm, whichever is the greater. It is recommended that the web plate connection to the hull envelope or bulkhead should end in a smooth tapered 'soft toe'. Recommended shapes of cut-out are shown in Figure 10.5.2 Cut-outs and connections, but consideration will be given to other shapes on the basis of maintaining equivalent strength and minimizing stress concentration. Consideration is to be given to the provision of adequate drainage and unimpeded flow of air and water when designing the cut-outs and connection details.

5.2.3 Asymmetrical secondary members are to be connected on the heel side to the primary member web plate. Additional connection by lugs on the opposite side may be required.

5.2.4 Symmetrical secondary members are to be connected by lugs on one or both sides, as necessary.

5.2.5 The cross-sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate permissible stress.

5.2.6 The total load P , transmitted to the primary member is to be derived in accordance with Table 10.5.1 Total load transmitted to connection of secondary members.

5.2.7 This load is to be apportioned between the connections as follows:

(a) Transmitted through the collar arrangement:

$$P_1 = P \left(\frac{s_1}{s_w} + \frac{A_1}{4C_f A_f + A_1} \right)$$

where A_f is derived in accordance with Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members and $\frac{s_1}{S_w}$ is not to be taken as greater than 0,25

The collar load factor, C_f , is to be derived as follows:

Symmetrical secondary members

$$\begin{aligned} C_f &= 1,85 && \text{for } A_f \leq 18 \\ C_f &= 1,85 - 0,0341 (A_f - 18) && \text{for } 18 < A_f \leq 40 \\ C_f &= 1,1 - 0,01 (A_f - 40) && \text{for } A_f > 40 \end{aligned}$$

Asymmetrical secondary members

$$C_f = 0,68 + 0,0224 \frac{b_l}{A_f}$$

where

A_f = the area, in cm², of the primary member web stiffener in way of the connection including backing bracket, where fitted (see Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members)

b_l = the length of lug or direct connection, in mm, as shown in Figure 10.5.2 Cut-outs and connections. Where the lug or direct connections differ in length a mean value of b_l is to be used.

(b) Transmitted through the primary member web stiffener:

$$P_2 = P - P_1 \text{ kN(tonne - f)}$$

(c) Where the web stiffener is not connected to the secondary member, P_1 is to be taken equal to P .

Table 10.5.1: Total load transmitted to connection of secondary members

Ship type	Head, h_1 , in metres	Total load, P , transmitted to connection
(1) Oil tankers, bulk chemical tankers and combination carriers, see Pt 3, Ch 10, 1.1 Application	<p>h_1 = load height, in metres, derived in accordance with the following provisions, but to be taken as not less than $\frac{L_1}{56}$ or $(0,01L_1 + 0,7)$ m whichever is the greater</p> <p>For shell framing members:</p> <p>(a) With mid-point of span at base line, $h_1 = 0,8D_2$</p> <p>(b) With mid-point of span at a distance $0,6D_2$ above base line, $h_1 = f D_2 B_f$</p> <p>(c) With mid-point of span intermediate between (a) and (b). The value of h_1 is to be obtained by linear interpolation between values from (a) and (b).</p> <p>(d) With mid-point of span higher than $0,6D_2$ above base line.</p>	<p>(a) In general</p> $P = 10,06 (S_w - s_1/2) s_1 h_1 \text{ kN}$ $(P = 1,025 (S_w - s_1/2) s_1 h_1 \text{ tonne-f})$ <p>(b) For wash bulkheads</p>

	$= \frac{h_1}{2}$ <p>h_1 = the distance from the longitudinal under consideration to the top of the tank, or half the distance to the top of the overflow, whichever is the greater</p> <p>= the distance from the longitudinal under consideration to the top of the tank, or half the distance to the top of the overflow, whichever is the greater</p>	$(P = 1,025 (S_w - s_1/2) s_1 h_1 \text{ tonne-f})$
<p>B_f = bow fullness factor determined from Figure 5.4.3 Illustration of bow fullness factor determination in Chapter 5 to be considered. To be taken as 1 for framing members located at and abaft 0,2L from the forward perpendicular</p> <p>f = load height factor at level 0,6D above base line, see Table 10.5.2 Load height factor, f</p> <p>h_1 = load height, in metres, see also Figure 10.5.2</p> <p>C = stowage rate, in m³/tonne, as defined in Pt 3, Ch 3, 5.2 Symbols. For cargo ships without the notation 'strengthened for heavy cargoes', the value to be used is 1,39 m³/tonne. For cargo ships and bulk carriers (see Pt 3, Ch 10, 1.1 Application) with the notation 'strengthened for heavy cargoes', the actual stowage rate is to be used, but the value is not to be taken greater than 0,865 m³/tonne</p> <p>H = height from inner bottom at position under consideration, to deck at side amidships, in metres, for inner bottom longitudinals</p> <p>= height from the longitudinal under consideration to the underside of the topside tank sloped bulkhead, in metres, for hopper longitudinals</p> <p>S_w = spacing of primary members, in metres</p> <p>s_1 = spacing of secondary members, in metres</p> <p>T = the summer draught, in metres, measured from top of keel</p> <p>D_2 = D in metres, but need not be taken greater than 1,67</p> <p>L_1 = L but need not be taken as greater than 190 m</p> <p>K_c = as defined in Table 11.7.1 Longitudinal and transverse bulkhead scantlings for ore loading in Pt 4, Ch 11 Ore Carriers</p>		

Table 10.5.2: Load height factor, f

		Ship depth, D metres					
		≤17,5	20	22.5	25	27.5	30
(1)	(a) For oil tankers, bulk chemical tankers and combination carriers (see Pt 3, Ch 10, 1.1 Application), tank boundaries wholly within parallel mid-body	0,6	0,6	0,582	0,556	0,535	0,517
	(b) For other ship types, at an abaft of 0,2L from the forward perpendicular						

(2)	(a) For oil tankers, bulk chemical tankers and combination carriers (see Pt 3, Ch 10, 1.1 Application), tank boundaries wholly or partially outside parallel mid-body (b) For other ship types, forward of 0,15L from the forward perpendicular	0,7	0,685	0,685	0,628	0,6	0,577
Note Intermediate values to be obtained by linear interpolation							

5.2.8 Load height diagrams for framing members (a) at and abaft 0,2L from the forward perpendicular and (b) forward of cargo tank region for oil tankers, bulk chemical tankers and combination carriers (see Pt 3, Ch 10, 1.1 Application) and forward of 0,15L from the forward perpendicular for other ship types

5.2.9 The effective cross-sectional area A_1 of the collar arrangements is to be taken as the sum of cross-sectional areas of the components of the connection as follows:

(a) Direct connection:

$$A_1 = 0,01 b_l t_w \text{ cm}^2$$

(b) Lug connection:

$$A_1 = 0,01 f_1 b_l t_l \text{ cm}^2$$

where

$f_1 = 1,0$ for symmetrical secondary member connections

$= \frac{140}{W_l}$ but not greater than 1,0, for asymmetrical secondary member connections

t_w = thickness of primary member web, in mm

t_2 = thickness, in mm, of lug connection, and is to be taken not greater than the thickness of the adjacent primary member web plate

W = overall width of the cut-out, in mm

W_2 = width for cut-out asymmetrical to secondary member web, in mm

see Figure 10.5.2 Cut-outs and connections

5.2.10 The values of A_f and A_1 are to be such that the stresses given in Table 10.5.3 Permissible stresses are not exceeded.

5.2.11 Where a bracket is fitted to the primary member web plate in addition to a connected stiffener it is to be arranged on the opposite side to, and in alignment with the stiffener. The arm length of the bracket is to be not less than the depth of the stiffener, and its cross-sectional area through the throat of the bracket is to be included in the calculation of A_f .

5.2.12 In general where the primary member stiffener is connected to the secondary member it is to be aligned with the web of the secondary member, except where the face plate of the latter is offset and abutted to the web, in which case the stiffener connection is to be lapped. Lapped connections of primary member stiffeners to mild steel bulb plate or rolled angle secondary members may also be permitted. Where such lapped connections are fitted, particular care is to be taken to ensure that the

primary member stiffener wrap around weld connection is free from undercut and notches, see also Pt 3, Ch 10, 2.9 Inspection of welds.

5.2.13 Fabricated longitudinals having the face plate welded to the underside of the web, leaving the edge of the web exposed, are not recommended for side shell and longitudinal bulkhead longitudinals. Where it is proposed to fit such sections, a symmetrical arrangement of connection to transverse members is to be incorporated. This can be achieved by fitting backing brackets on the opposite side of the transverse web or bulkhead. The primary member stiffener and backing brackets are to be lapped to the longitudinal web, see Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members.

5.2.14 For ship types for which oil tanker (see Pt 3, Ch 10, 1.1 Application) requirements are not applicable, the collar arrangement is to satisfy the requirements of Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members to Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members inclusive. In addition the weld area of the connections is to be not less than the following:

Welding and Structural Details

Part 3, Chapter 10

Section 5

(a) Connection of primary member stiffener to the secondary member:

$$A_w = 0,25 A_f \text{ or } 6,5 \text{ cm}^2, \text{ whichever is the greater, corresponding to a weld factor of } 0,34 \text{ for the throat thickness}$$

(b) Connection of secondary member to the web of the primary member:

$$A_w = 0,5\sqrt{Z} \text{ corresponding to a weld factor of } 0,34 \text{ in tanks or } 0,27 \text{ in dry spaces for the throat thickness}$$

where

A_w = weld area, in cm^2 , and is calculated as total length of weld, in cm, multiplied by throat thickness, in cm

A_f = cross-sectional area of the primary member web stiffener, in cm^2 , in way of connection

Z = the section modulus, in cm^3 , of the secondary member.

Table 10.5.3: Permissible stresses

Item		Direct stress, in N/mm ² (kgf/mm ²) (see Notes 1 and 2)		Shear stress, in N/mm ² (kgf/mm ²) (see Note 1)	Other ship types for which oil tanker requirements are not applicable
		Oil tankers	Other ship types for which oil tanker requirements are not applicable	Oil tankers and ship types where primary member stiffener unconnected	
Primary member web plate stiffener within distance <i>a</i> of end see Figure 10.5.2 Cut-outs and connections		147,2 (15,0)	157 (16,0)	—	—
Welding of primary member web plate stiffener to secondary member	Butted	98,1 (10,0) (double continuous fillet)	117,7 (12,0) (double continuous fillet)	—	—
		147,2 (15,0) (automatic deep penetration)	157 (16,0) (automatic deep penetration)	—	—
	Lapped	—	—	83,4 (8,5) See Note 2	98,1 (10,0) See Note 2
Lug or collar plate and weld	Single	—	—	68,6 (7,0)	98,1 (10,0)
	Double	—	—	83,4 (8,5)	
Note (1) The welding requirements of Pt 3, Ch 10, 2 Welding, and where applicable Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members are also to be complied with, see Pt 3, Ch 10, 1.1 Application.					
Note (2) Where longitudinals are of higher tensile steel having a yield stress of 32 kg/mm ² or more, these stresses are to be divided by the factor 1,2 for application to side longitudinals above 0,3 <i>D</i> ₂ from the base-line. For definition of <i>D</i> ₂ see Table 10.5.1 Total load transmitted to connection of secondary members.					

5.2.15 Where the stiffeners of the double bottom floors, and the hopper primary members are unconnected to the secondary members and offset from them (see Figure 10.5.3 Arrangement with offset stiffener) the collar arrangement is to satisfy the requirements of Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members to Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members inclusive. In addition, the fillet welds attaching the lugs to the secondary members are to be based on a weld factor of 0,44 for the throat thickness. To facilitate access for welding the offset stiffeners are to be located 50 mm from the slot edge furthest from the web of the secondary member. The ends of the offset stiffeners are to be suitably tapered and softened.

**Figure 10.5.3: Arrangement with offset stiffener**

5.2.16 Alternative arrangements will be considered on the basis of their ability to transmit load with equivalent effectiveness. Details of the calculations made and testing procedures are to be submitted.

5.3 Openings

5.3.1 Manholes, lightening holes and other cut-outs are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are not to be cut in vertical or horizontal diaphragm plates in narrow cofferdams or double plate bulkheads within one-third of their length from either end, nor in floors or double bottom girders close to their span ends, or below the heels of pillars, unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory.

5.3.2 Manholes, lightening holes and other openings are to be suitably framed and stiffened where necessary.

5.3.3 Air and drain holes, notches and scallops are to be kept at least 200 mm clear of the toes of end brackets and other areas of high stress. Openings are to be well rounded with smooth edges. Details of scalloped construction are shown in Figure 10.2.1 Weld dimensions and types. Closely spaced scallops are not permitted in higher tensile steel members. Widely spaced air or drain holes may be accepted, provided that they are of elliptical shape, or equivalent, to minimise stress concentration and are, in general, cut clear of the weld connection.

5.4 Sheerstrake and bulwarks

5.4.1 Where an angled gunwale is fitted, the top edge of the sheerstrake is to be kept free of all notches and isolated welded fittings. Bulwarks are not to be welded to the top of the sheerstrake within the $0,5L$ amidships.

5.4.2 Where a rounded gunwale is adopted, the welding of fairlead stools and other fittings to this plate is to be kept to the minimum, and the design of the fittings is to be such as to minimise stress concentration.

5.4.3 Arrangements are to ensure a smooth transition from rounded gunwale to angled gunwale towards the ends of the ship.

5.4.4 At the ends of superstructures where the side plating is extended and tapered to align with the bulwark plating, the transition plating is to be suitably stiffened and supported. Where freeing ports or other openings are essential in this plate, they are to be suitably framed and kept well clear of the free edge.

5.5 Fittings and attachments, general

5.5.1 The quality of welding and general workmanship of fittings and attachments as given in Pt 3, Ch 10, 5.6 Bilge keels and ground bars and Pt 3, Ch 10, 5.7 Other fittings and attachments are to be equivalent to that of the main hull structure. Visual examination of all welds is to be supplemented by non-destructive testing as considered necessary by the Surveyor.

5.6 Bilge keels and ground bars

5.6.1 It is recommended that bilge keels should not be fitted in the forward $0,3L$ region on ships intended to navigate in severe ice conditions.

5.6.2 Bilge keels are to be attached to a continuous ground bar as shown in Figure 10.5.4 Bilge keel construction. Butt welds in shell plating, ground bar and bilge keels are to be staggered.

5.6.3 The minimum thickness of the ground bar is to be equal to the thickness of the bilge strake or 14 mm, whichever is the lesser.

5.6.4 The material class, grade and quality of the ground bar are to be in accordance with Table 2.2.1 Material classes and grades.

5.6.5 The ground bar is to be connected to the shell with a continuous fillet weld and the bilge keel to the ground bar with a light continuous fillet weld.

5.6.6 Direct connection between ground bar butt welds and shell plating, and between bilge keel butt welds and ground bar is to be avoided.

5.6.7 The design of single web bilge keels is to ensure that failure to the web occurs before failure of the ground bar. In general, this may be achieved by ensuring the web thickness of bilge keels does not exceed that of the ground bar.

Figure 10.5.4: Bilge keel construction

5.6.8 The end details of bilge keels and intermittent bilge keels, where adopted, are to be as shown in Figure 10.5.5 Bilge keel end design.

5.6.9 The ground bar and bilge keel ends are to be tapered or rounded. Where the ends are tapered, the tapers are to be gradual with ratios of at least 3:1, see Figure 10.5.5 Bilge keel end design. Where the ends are rounded, details are to be as shown in Figure 10.5.5 Bilge keel end design. Cut-outs on the bilge keel web within zone 'A' (see Figure 10.5.5 Bilge keel end design) are not permitted.

5.6.10 The end of the bilge keel web is to be between 50 mm and 100 mm from the end of the ground bar, see Figure 10.5.5 Bilge keel end design.

5.6.11 An internal transverse support is to be positioned as close as possible to halfway between the end of the bilge keel web and the end of the ground bar, see Figure 10.5.5 Bilge keel end design.

5.6.12 Where an internal longitudinal stiffener is fitted in line with the bilge keel web, the longitudinal stiffener is to extend to at least the nearest transverse member outside zone 'A', see Figure 10.5.5 Bilge keel end design. In this case, the requirement of Pt 3, Ch 10, 5.6 Bilge keels and ground bars does not apply.

5.6.13 For ships over 65 m in length, holes are to be drilled in the bilge keel butt welds. The size and position of these holes are to be as illustrated in Figure 10.5.4 Bilge keel construction. Where the butt weld has been subject to non-destructive examination the stop hole may be omitted.

5.6.14 Bilge keels of a different design from that shown in Figure 10.5.4 Bilge keel construction and Figure 10.5.5 Bilge keel end design will be specially considered.

5.6.15 Within zone 'B', (see Figure 10.5.5 Bilge keel end design), welds at the end of the ground bar and bilge plating, and at the end of the bilge keel web and ground bar, are to have weld factors of 0,44 and 0,34 respectively. These welds are to be ground and to blend smoothly with the base materials.

5794/01

Figure 10.5.5: Bilge keel end design

5.6.16 A plan of the bilge keels is to be submitted for approval of material grades, welded connections and detail design.

5.7 Other fittings and attachments

5.7.1 Gutterway bars at the upper deck are to be so arranged that the effect of main hull stresses on them is minimised.

5.7.2 Minor attachments, such as pipe clips, staging lugs and supports, are generally to be kept clear of toes of end brackets, corners of openings and similar areas of high stress. Where connected to asymmetrical stiffeners, the attachments may be in line with the web providing the fillet weld leg length is clear of the offset face plate or flange edge. Where this cannot be achieved the attachments are to be connected to the web, and in the case of flanged stiffeners they are to be kept at least 25 mm clear of the flange edge. On symmetrical stiffeners, they may be connected to the web or to the centreline of the face plate in line with the web.

5.7.3 Where necessary in the construction of the ship, lifting lugs may be welded to the hull plating but they are not to be slotted through. Where they are subsequently removed, this is to be done by flame or mechanical cutting close to the plate surface, and the remaining material and welding ground off. After removal the area is to be carefully examined to ensure freedom from cracks or other defects in the plate surface.

■ *Section 6*

Access arrangements for oil tankers and bulk carriers

6.1 Application

6.1.1 Access arrangements are to be provided as required by SOLAS.

6.2 Information for approval

6.2.1 Details of the attachment of the access arrangements to the ship's structure are to be submitted for approval and suitable designs are to take into account proper location, strength, detail and reinforcement of all attachments to hull structural members.

Closing Arrangements for Shell, Deck and Bulkheads

- 9 **Watertight doors in bulkheads below the freeboard deck**
- 10 **External openings and openings in watertight bulkheads and internal decks in cargo ships**

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to all ship types detailed in Pt 4 Ship Structures (Ship Types), unless otherwise stated, with the exception of Sections 1 to 5 which are not applicable to Bulk Carriers with a **CSR** notation and Section Pt 3, Ch 11, 6.1 Small hatchways on exposed decks which is not applicable to Bulk Carriers and Oil Tankers with a **CSR** notation, see Pt 1, Ch 2, 2.3 Class notations (hull). Additional provisions regarding access arrangements for oil tankers and chemical carriers are contained in Pt 4, Ch 9 Double Hull Oil Tankers, Pt 4, Ch 10 Single Hull Oil Tankers and the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals), respectively.

1.1.2 Requirements are given for steel and wooden hatch covers, securing arrangements, tarpaulins, coamings and side shell doors for main openings, also closing arrangements for other miscellaneous openings.

1.1.3 Where relevant, the contents of this Chapter conform with the requirements of the *International Convention on Load Lines, 1966*. Attention should, however, be given to any additional Statutory Requirements of the National Authority of the country in which the ship is to be registered and to the relevant regulations of the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments.

1.1.4 For the purpose of this Chapter the basic types of ships are those defined in the *International Convention on Load Lines, 1966*, namely:

Type 'A'	Ships designed solely for the carriage of liquid cargoes.
Type 'B'	Cargo ships, other than Type 'A', with steel weathertight hatch covers.
Type 'B-100'	Cargo ships of type 'B' with reduced freeboards on account of their ability to survive a stipulated damage.
Type 'B-60'	Cargo ships of type 'B' with reduced freeboards on account of their ability to survive a stipulated damage.
Type 'B +'	Cargo ships with increased freeboard on account of hatch cover arrangements.

1.1.5 The type of hatch covers on the weather decks of the basic ship types defined in Pt 3, Ch 11, 1.1 Application are detailed below and may be used in the types of ships as indicated in Table 11.1.1 Covers associated with ship types:

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 1

- (a) Steel plated cargo hatch covers stiffened by webs or stiffeners and secured by clamping devices. Weathertightness to be achieved by means of gaskets. Hatch covers used for holds containing liquid cargoes are included in this category.
- (b) Steel plated cargo hatch pontoon covers having interior webs and stiffeners extending for the full width of the hatchway. A pontoon cover is defined as a portable cover, secured weathertight by tarpaulins and battening devices.
- (c) Hatch covers of wood or steel used in conjunction with portable beams. Weathertightness to be obtained by tarpaulins.
- (d) Access hatch covers for cargo oil tanks and adjacent spaces. The hatch covers are to be of steel and gasketed.
- (e) Access hatch covers other than (d). For Type 'A', Type 'B-100' and Type 'B-60' ships, the covers are to be of steel, and weathertightness is to be achieved by means of gaskets.

Table 11.1.1: Covers associated with ship types

Type of cover	Type of ship				
	'A'	'B-100'	'B-60'	'B'	'B+'
(a)	–	X	X	X	X
(b)	–	–	–	X	X
(c)	–	–	–	–	X
(d)	X	X	X	Not applicable	
(e)	X	X	X	X	X

1.1.6 The positions of hatches on weather decks are defined in Pt 3, Ch 1, 6.5 Position 1 and Position 2.

1.1.7 'Tween deck hatch covers may be any of the types defined in Pt 3, Ch 11, 1.1 Application, but need not be weathertight unless fitted to deep tanks or water ballast holds or compartments, in which case the covers are to be of type (a) and oiltight or watertight as appropriate.

1.1.8 The scantlings specified in the following Sections are applicable to covers of mild steel or higher tensile steel. Where other materials are used, equivalent scantlings are to be provided. The scantlings apply basically to rectangular covers, with the stiffening members arranged primarily in one direction and carrying a uniformly distributed load. The covers are assumed to be simply supported. Where covers are stiffened by a grillage formation, and also where point loads are applied to any type of cover, the scantlings are to be determined from direct calculations.

1.1.9 In the case of flush hatch covers or of covers on coamings of lesser height than required by Pt 3, Ch 11, 5.1 General, their scantlings, the securing and sealing arrangements and the drainage of gutterways will be specially considered.

1.1.10 The scantlings of hatch covers need to be increased only if the loading exceeds that given in Pt 3, Ch 11, 2.3 Load model. The scantlings of the surrounding deck structure are to be sufficient to support this loading. Heavier loading may be permitted only if the scantlings of the cover are capable of withstanding this increased loading, satisfying the stress and deflection criteria given in this Chapter. The deck structure is also to be capable of withstanding this increased loading.

1.1.11 Where timber cargo is to be carried on the hatch covers the requirements of Pt 3, Ch 9, 2.11 Scantlings of hatch covers are to be satisfied in addition to the requirements of this Chapter.

1.1.12 Where hatchways are trunked through one or more 'tween decks, and hatchway beams and covers are dispensed with at the intermediate decks, the hatchway beams, coamings and covers immediately below the trunk are to be adequately strengthened. Plans are to be submitted for approval.

1.1.13 The net plate thickness, t_{net} , is the calculated minimum thickness of the plating and stiffeners. The required thickness is the net thickness plus a corrosion addition, t_c , given in Table 11.1.2 Corrosion addition t_c .

Table 11.1.2: Corrosion addition t_c

Application	Structure	t_c , in mm
Weather deck hatches of container ships, car carriers, paper carriers, passenger vessels	Hatch covers	1,0
	Hatch coamings	1,0

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

Weather deck hatches of all other ship types except bulk carriers, ore carriers and combination carriers, see Pt 4, Ch 7, 12.1 General	Hatch covers in general	2,0
	Weather exposed plating and bottom plating of double skin hatch covers	1,5
	Internal structure of double skin hatch covers and closed box girders	1,0
	Hatch coamings	1,5
Weather deck hatches of all other ship types except bulk carriers, ore carriers and combination carriers, see Pt 4, Ch 7, 12.1 General	Coaming stays and stiffeners	1,5
'Tween deck hatches	Hatch covers in general	1,0

Section 2

Steel hatch covers

2.1 General

2.1.1 The requirements of Pt 3, Ch 11, 2 Steel hatch covers are not applicable to hatch covers of bulk carriers, ore carriers and combination carriers.

2.1.2 The strength requirements in 2.1 to Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners are applicable to hatch covers and closing arrangements of stiffened plate construction. The strength requirements are applicable to exposed weather deck hatch covers and 'tween deck hatch covers, unless otherwise stated.

2.1.3 Sub-Sections 2.1 to Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners are not applicable to portable covers secured weathertight by tarpaulins and battening devices, or pontoon covers, see Pt 3, Ch 11, 2.17 Pontoon covers.

2.1.4 Unless otherwise stated, the thicknesses referred to in the following Sections are net thicknesses. The net thicknesses are the member thicknesses necessary to obtain the minimum net scantlings required in this Section. The required gross thicknesses are obtained by adding corrosion additions, t_c , given in Table 11.1.2 Corrosion addition t_c . Strength calculations using beam theory, grillage analysis or FEM are to be performed with net scantlings.

2.1.5 Material class I is to be applied for hatch covers.

2.1.6 The strength and closing arrangements of hatch covers are to comply with Pt 4, Ch 7, 12 Steel hatch covers in addition to the requirements in this Chapter when hatch covers are subjected to internal ballast or oil cargo pressure.

2.1.7 Hatch covers are to comply with Pt 4, Ch 8, 11 Hatch covers in addition to the requirements in this Chapter when containers are carried on covers.

2.2 Stiffener arrangement

2.2.1 The primary supporting members and secondary stiffeners of hatch covers are to be continuous over the breadth and length of hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load-carrying capacity.

2.2.2 The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed one third of the span of primary supporting members. When strength calculation is carried out by FE analysis using plane strain or shell elements, this requirement can be waived.

2.3 Load model

2.3.1 The structural assessment of hatch covers is to be carried out using the design loads defined in this Section. The following symbols and definitions are applicable to this Section:

x = longitudinal co-ordinate measured from the AP to mid point of assessed structural member

T_{fb} = draught, in metres, corresponding to the assigned summer load line

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

$$h_N = \text{standard superstructure height in metres}$$

$$= 1,05 + 0,01L_L, 1,8 \leq h_N \leq 2,3$$

where

$$L_L = \text{load line length, as defined in Pt 3, Ch 1, 6.1 Principal particulars.}$$

2.3.2 The vertical weather design pressure, p_H , in kN/m^2 , on the hatch cover panels is to be taken from Table 11.2.1 Design pressure p_H of weather deck hatches. When cargo is carried on the cover, cargo loads according to Pt 3, Ch 11, 2.3 Load model, Pt 3, Ch 11, 2.3 Load model and Pt 4, Ch 8, 11.2 Direct calculations are to be considered. The vertical weather design load needs not to be combined with the cargo load. For 'tween deck hatch covers not exposed to weather load, the structural assessment is to be carried out using the cargo loads defined in Pt 3, Ch 11, 2.3 Load model and Pt 3, Ch 11, 2.3 Load model. Covers carrying wheeled vehicles are also to comply with Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles and where it is proposed to provide a helicopter landing area, covers are also to comply with Pt 3, Ch 9, 5 Helicopter landing areas. Where an increased freeboard is assigned, the design load for hatch covers according to Table 11.2.1 Design pressure p_H of weather deck hatches on the actual freeboard deck may be as required for a superstructure deck, provided the summer freeboard is such that the resulting draught will not be greater than that corresponding to the minimum freeboard calculated from an assumed freeboard deck situated at a distance at least equal to the standard superstructure height, h_N , below the actual freeboard deck, see Figure 11.2.2 Positions 1 and 2 for an increased freeboard.

2.3.3 The horizontal weather design pressure, in kN/m^2 , for determining the scantlings of outer edge girders (skirt plates) of weather deck hatch covers and of hatch coamings is:

$$p_A = a c (b c_L f - z) \text{ kN/m}^2$$

$$f = \frac{L}{25} + 4,1 \text{ for } L < 90 \text{ m}$$

$$= 10,75 - \left(\frac{300 - L}{100} \right)^{1,5} \text{ for } 90 \text{ m} \leq L < 300 \text{ m}$$

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

$$= 10,75 \text{ for } 300 \text{ m} \leq L < 350 \text{ m}$$

$$= 10,75 - \left(\frac{L - 350}{100} \right)^{1,5} \text{ for } 350 \text{ m} \leq L \leq 500 \text{ m}$$

$$c_L = \sqrt{\frac{L}{90}} \text{ for } L < 90 \text{ m}$$

$$= 1$$

$$a = 1 \text{ for unprotected front coamings and hatch cover skirt plates}$$

$$= 1$$

$$= 20 + \frac{L_1}{12} \text{ for unprotected front coamings and hatch cover skirt plates}$$

$$a = 10 + \frac{L_1}{12} \text{ for unprotected front coamings and hatch cover skirt plates, where the distance from the actual freeboard deck to the summer load line exceeds the minimum non-corrected tabular freeboard according to ICLL by at least one standard superstructure height } h_N$$

$$a = 5 + \frac{L_1}{15} \text{ for side and protected front coamings and hatch cover skirt plates}$$

$$a = 7 + \frac{L_1}{100} - 8 \frac{x'}{L} \text{ for aft ends of coamings and aft hatch cover skirt plates abaft amidships}$$

$$a = 5 + \frac{L_1}{100} - 4 \frac{x'}{L} \text{ for aft ends of coamings and aft hatch cover skirt plates forward of amidships}$$

$$L_1 = L, \text{ need not be taken greater than } 300 \text{ m}$$

$$b = 1,0 + \left(\frac{\frac{x'}{L} - 0,45}{C_b + 0,2} \right)^2 \text{ for } \left(\frac{x'}{L} \right) < 0,45$$

$$b = 1,0 + 1,5 \left(\frac{\frac{x'}{L} - 0,45}{C_b + 0,2} \right)^2 \text{ for } \left(\frac{x'}{L} \right) \geq 0,45$$

$$= 0,6 \leq C_b \leq 0,8, \text{ when determining scantlings of aft ends of coamings and aft hatch cover skirt plates forward of amidships, } C_b \text{ need not be taken less than } 0,8$$

$$C_b = \text{block coefficient, as defined in Pt 3, Ch 1, 6.1 Principal particulars}$$

$$x' = \text{distance, in metres, between the transverse coaming or hatch cover skirt plate considered and aft end of the length } L. \text{ When determining side coamings or side hatch cover skirt plates, the side is to be subdivided into parts of approximately equal length, not exceeding } 0,15L \text{ each, and } x' \text{ is to be taken as the distance between aft end of the length } L \text{ and the centre of each part considered}$$

$$z = \text{vertical distance in metres from the summer load line to the mid point of stiffener span, or to the middle of the plate field}$$

$$c = 0,3 + 0,7 \frac{b'}{B}$$

$$b' = \text{breadth of coaming in metres at the position considered}$$

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

B' = actual maximum breadth of ship in metres on the exposed weather deck at the position considered b/B' is not to be taken less than 0,25

The design pressure p_A is not to be taken less than the minimum values given in Table 11.2.2 Minimum design load, p_{Amin} .

Table 11.2.2: Minimum design load, p_{Amin}

L	p_{Amin} , kN/m ²	
	For unprotected fronts	Elsewhere
≤ 50	30	15
> 50	$25 + \frac{L}{10}$	$12,5 + \frac{L}{20}$
< 250		
≥ 250	50	25

2.3.4 The pressure on hatch covers due to distributed cargo loads p_L , in kN/m², resulting from heave and pitch, is to be determined according to the following formula:

$$p_L = p_c(1 + a_v) \text{ kN/m}^2$$

where

$$p_c = \text{uniform cargo load, in kN/m}^2$$

Note For 'tween deck hatch covers, p_c is not to be taken less than $7,07 H_{td}$ kN/m², see Pt 3, Ch 3, 5.2 Symbols, Table 3.5.1 Design heads and permissible cargo loadings and Figure 3.5.1 Heads for 'tween decks. A design load less than this will be specially considered.

a_v = acceleration addition as follows:

$$a_v = F m$$

$$F = 0,11 \sqrt{\frac{v_0}{L}}$$

$$m = m_0 - 5(m_0 - 1) \frac{x}{L} \text{ for } 0 \leq \frac{x}{L} \leq 0,2$$

$$= 1,0 \text{ for } 0,2 < \frac{x}{L} \leq 0,7$$

$$= 1 + \frac{m_0 + 1}{0,3} \left(\frac{x}{L} - 0,7 \right) \text{ for } 0,7 < \frac{x}{L} \leq 1,0$$

$$m_0 = 1,5 + F$$

$$v_0 = \text{Maximum speed at summer load line draught, } v_0 \text{ is not to be taken less than } \sqrt{L}, \text{ in knots.}$$

2.3.5 Point loads due to single forces, P , in kN resulting from heave and pitch are to be determined as follows:

$$P = P_s(1 + a_v) \text{ kN}$$

$$P_s = \text{single force, in kN.}$$

2.3.6 In addition to the loads defined in this Section, hatch covers are loaded in the ship's transverse direction by forces due to elastic deformations of the ship's hull. Hatch covers are to be designed such that the sum of stresses does not exceed the permissible values given in Pt 3, Ch 11, 2.4 Allowable stress and deflection.

2.4 Allowable stress and deflection

2.4.1 The equivalent stress, σ_v , in steel hatch cover structures related to the net thickness shall not exceed $0,8\sigma_0$, where σ_0 is the minimum yield stress, in N/mm^2 , of the material. For design loads according to Pt 3, Ch 11, 2.3 Load model and Pt 4, Ch 8, 11.2 Direct calculations, the equivalent stress, σ_v , related to the net thickness shall not exceed $0,9\sigma_0$ when the stresses are assessed by means of FEM using plane stress or shell elements.

For beam element calculations and grillage analysis, the equivalent stress may be taken as follows:

$$\sigma_v = \sqrt{\sigma^2 + 3\tau^2}, \text{ in } \text{N/mm}^2$$

σ = normal stress in N/mm^2

τ = shear stress in N/mm^2

For FEM calculations, the equivalent stress may be taken as follows:

$$\sigma_v = \sqrt{\sigma_x^2 - \sigma_x\sigma_y + \sigma_y^2 + 3\tau^2}, \text{ N/mm}^2$$

σ_x = normal stress, in N/mm^2 , in x-direction

σ_y = normal stress, in N/mm^2 , in y-direction

τ = shear stress, in N/mm^2 , in the x-y plane

Indices x and y are coordinates of a two-dimensional Cartesian system in the plane of the considered structural element.

In the case of FEM calculations using shell or plane strain elements, the stresses are to be read from the centre of the individual element. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element. Stress concentrations are to be considered. FEM calculations are to be carried out in accordance with the ShipRight procedure *Assessment of Steel Hatch Covers using Finite Element Analysis*.

2.4.2 The vertical deflection of primary supporting members due to the vertical weather design load according to Pt 3, Ch 11, 2.3 Load model, is to be not more than $0,0056/l_g$ where l_g is the greatest span of primary supporting members.

For 'tween deck hatch covers not exposed to the vertical weather design load according to Pt 3, Ch 11, 2.3 Load model, the vertical deflection of primary supporting members due to the cargo loads according to Pt 3, Ch 11, 2.3 Load model and Pt 4, Ch 8, 11.2 Direct calculations is to be not more than $0,007/l_g$ where l_g is the greatest span of primary supporting members.

2.5 Local net plate thickness

2.5.1 The local net plate thickness, t , in mm, of the hatch cover top plating is not to be less than:

$$t = F_p 0,0158s \sqrt{\frac{p}{0,95\sigma_0}}$$

= and to be not less than 1 per cent of the spacing of the stiffener or 6 mm, whichever is greater

F_p = factor for combined membrane and bending response

= 1,5 in general

= $1,9 \frac{\sigma}{\sigma_a}$, for $\frac{\sigma}{\sigma_a} \geq 0,8$

= for the attached plate flange of primary supporting members

s = stiffener spacing, in mm

p = pressure p_H and p_L , in kN/m^2 , as defined in Pt 3, Ch 11, 2.3 Load model

σ = normal stress, in N/mm^2 , of hatch cover top plating

$$\sigma_a = 0,8\sigma_o, \text{ in } \text{N/mm}^2$$

For flange plates under compression, sufficient buckling strength according to Pt 3, Ch 11, 2.11 Buckling strength of hatch cover structures is to be demonstrated.

The normal stress σ of the hatch cover plating may be determined in a distance s from webs of adjacent primary supporting members perpendicular to secondary stiffeners, and in a distance $s/2$ from the web of an adjacent primary supporting member parallel to secondary stiffeners, see Figure 11.2.3 Determination of normal stress of the hatch cover plating. The greater of both stresses is to be taken. For the distribution of normal stress σ between two parallel girders, see Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating.

Figure 11.2.3: Determination of normal stress of the hatch cover plating

2.6 Local plate thickness of hatch covers for wheel loading and helicopter landing

2.6.1 The local gross plate thickness of hatch covers for wheel loading is to comply with Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles.

2.6.2 The local gross plate thickness of hatch covers for helicopter landing is to comply with Pt 3, Ch 9, 5 Helicopter landing areas.

2.7 Lower plating of double skin hatch covers and box girders

2.7.1 The thickness to fulfil the strength requirements is to be obtained from the calculation according to Pt 3, Ch 11, 2.10 Strength calculations under consideration of permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection. The net thickness must not be less than the larger of the following values when the lower plating is taken into account as a strength member of the hatch cover:

$$t = 0,0065s, \text{ in mm}$$

$$t_{\min} = 5 \text{ mm}$$

s = stiffener spacing, in mm.

2.8 Net scantling of secondary stiffeners

2.8.1 The net section modulus, Z , and net shear area, A_s , of uniformly loaded hatch cover stiffeners constrained at both ends is not to be less than:

$$Z = \frac{0,104}{\sigma_o} sl^2 p, \text{ in cm}^3$$

$$A_s = \frac{0,01}{\sigma_o} slp, \text{ in cm}^2$$

= where

l = secondary stiffener span, in metres, to be taken as the spacing, in metres, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable

s = secondary stiffener spacing, in mm

p = pressure p_H and p_L , in kN/m², as defined in Pt 3, Ch 11, 2.3 Load model.

2.8.2 The net section modulus of the secondary stiffeners is to be determined, based on an attached plate width assumed equal to the stiffener spacing.

2.8.3 For flat bar secondary stiffeners and buckling stiffeners, the ratio h/t_w is to be not greater than $15k^{0.5}$

where

h = height of the stiffener

t_w = net thickness of the stiffener

$k = 235/\sigma_o$.

2.8.4 Stiffeners parallel to primary supporting members and arranged within the effective breadth according to Pt 3, Ch 11, 2.10 Strength calculations must be continuous when crossing primary supporting members and may be considered when calculating the cross-sectional properties of primary supporting members. It is to be verified that the combined stress of those stiffeners, induced by the bending of primary supporting members and lateral pressures, does not exceed the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection.

2.8.5 For hatch cover stiffeners under compression, sufficient safety against lateral and torsional buckling according to Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners and Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners is to be verified.

2.8.6 For hatch covers subject to wheel loading, stiffener gross scantlings are to comply with Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles.

2.8.7 For hatch covers subject to helicopter landing, stiffener gross scantlings are to comply with Pt 3, Ch 9, 5 Helicopter landing areas.

2.9 Net scantling of primary supporting members

2.9.1 Scantlings of primary supporting members are obtained from calculations according to Pt 3, Ch 11, 2.10 Strength calculations, under consideration of permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection.

2.9.2 For all components of primary supporting members, sufficient safety against buckling must be verified according to Pt 3, Ch 11, 2.11 Buckling strength of hatch cover structures to Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners. For biaxial compressed flange plates, this is to be verified within the effective widths according to Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating.

2.9.3 The net thickness, t , in mm, of webs of primary supporting members is not to be less than:

(a) $0,0065s$, in mm

(b) 5 mm

where

s = stiffener spacing, in mm.

2.9.4 Scantlings of edge girders (skirt plates) are obtained from the calculations according to Pt 3, Ch 11, 2.10 Strength calculations, under consideration of permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

2.9.5 The net thickness, t , in mm, of the outer edge girders exposed to wash of sea is not to be less than the largest of the following values:

(a) $0,0158s \sqrt{\frac{p_A}{0,95 \sigma_o}}$

(b) $0,0085s$ mm

(c) 5 mm

where

p_A = horizontal pressure, as defined in Pt 3, Ch 11, 2.3 Load model

s = stiffener spacing, in mm.

2.9.6 The stiffness of edge girders is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, in cm^4 , of edge girders is not to be less than:

$$I = 6q s_{SD}^4$$

q = packing line pressure, in N/mm, minimum 5 N/mm

s_{SD} = spacing, in metres, of securing devices.

2.10 Strength calculations

2.10.1 Strength calculation for hatch covers may be carried out by using either beam theory, grillage analysis or FEM.

2.10.2 The effective cross-sectional properties for calculation by beam theory or grillage analysis are to be determined considering the effective breadth. Cross-sectional areas of secondary stiffeners parallel to the primary supporting member under consideration within the effective breadth can be included, see Figure 11.2.5 Stiffening parallel to web of primary supporting member. The effective breadth of plating, e_m , of primary supporting members is to be determined according to Table 11.2.3 Effective breadth e_m of plating of primary supporting members, considering the type of loading. Special calculations may be required for determining the effective breadth of one-sided or non-symmetrical flanges. The effective cross-sectional area of plates is not to be less than the cross-sectional area of the face-plate. For flange plates under compression with secondary stiffeners perpendicular to the web of the primary supporting member, the effective width is to be determined according to Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating.

Table 11.2.3: Effective breadth e_m of plating of primary supporting members

l/e	0	1	2	3	4	5	6	7	≥ 8
e_{m1}/e	0	0,36	0,64	0,82	0,91	0,96	0,98	1,00	1,00
e_{m2}/e	0	0,20	0,37	0,52	0,65	0,75	0,84	0,89	0,90
Symbols									
e_{m1}	is to be applied where primary supporting members are loaded by uniformly distributed loads or else by no fewer than six equally spaced single loads								
e_{m2}	is to be applied where primary supporting members are loaded by three or fewer single loads. Intermediate values may be obtained by direct interpolation								
l	length of zero-points of bending moment curve: $l = l_0$ for simply supported primary supporting members $l = 0,6 l_0$ for primary supporting members with both ends constrained								
where									
l_0	is the unsupported length of the primary supporting member								
e	width of plating supported, measured from centre to centre of the adjacent unsupported fields								

2.11 Buckling strength of hatch cover structures

2.11.1 For hatch cover structures, sufficient buckling strength is to be demonstrated.

a = length of the longer side of a single plate field, in mm

b = breadth of the shorter side of a single plate field, in mm

α = aspect ratio of single plate field

$$= a/b$$

n = number of single plate field breadths within the partial or total plate field

t = net plate thickness, in mm

σ_x = membrane stress, in N/mm², in x-direction

σ_y = membrane stress, in N/mm², in y-direction

τ = shear stress, in N/mm², in the x-y plane

E = modulus of elasticity, in N/mm², of the material

$$= 2,06 \times 10^5 \text{ N/mm}^2 \text{ for steel}$$

σ_F = minimum yield stress, in N/mm², of the material.

Compressive and shear stresses are to be taken positive, tension stresses are to be taken negative.

If stresses in the x- and y-direction already contain the Poisson effect (calculated using FEM), the following modified stress values may be used. Both stresses σ_x^* and σ_y^* are to be compressive stresses, in order to apply the stress reduction according to the following formulae.

$$\sigma_x = \frac{(\sigma_x^* - 0,3 \sigma_y^*)}{0,91}$$

$$\sigma_y = \frac{(\sigma_y^* - 0,3 \sigma_x^*)}{0,91}$$

σ_x^*, σ_y^* = stresses containing the Poisson effect where compressive stress fulfils the condition

$$\sigma_y^* < 0,3 \sigma_x^*, \text{ then } \sigma_y = 0 \text{ and } \sigma_x = \sigma_x^*$$

where compressive stress fulfils the condition

$$\sigma_x^* < 0,3 \sigma_y^*, \text{ then } \sigma_x = 0 \text{ and } \sigma_y = \sigma_y^*$$

F_1 = correction factor for boundary condition at the longitudinal stiffeners according to Table 11.2.4 Correction factor F1

σ_e = reference stress, in N/mm², taken equal to

$$= 0,9E \left(\frac{t}{b} \right)^2$$

ψ = edge stress ratio taken equal to

$$= \frac{\sigma_2}{\sigma_1}$$

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

where

σ_1 = maximum compressive stress

σ_2 = minimum compressive stress or tension stress

S = safety factor (based on net scantling approach), taken equal to

= 1,25 for hatch covers when subjected to the vertical weather design load according to Pt 3, Ch 11, 2.3 Load model

= 1,10 for hatch covers when subjected to loads according to Pt 3, Ch 11, 2.3 Load model and Pt 4, Ch 8, 11.2 Direct calculations

λ = reference degree of slenderness, taken equal to:

$$= \sqrt{\frac{\sigma_0}{K \sigma_e}}$$

K = buckling factor according to Table 11.2.6 Buckling and reduction factors for plane elementary plate panels.

Table 11.2.4: Correction factor F_1

Stiffeners sniped at both ends	1,00	
Guidance values, see Note 1, where both ends are effectively connected to adjacent structures	1,05	for flat bars
	1,10	for bulb sections
	1,21	for angle and tee-sections
	1,30	for u-type sections, see Note 2, and girders of high rigidity
An average value of F , see Note 1, is to be used for plate panels having different edge stiffeners		
Note 1. Exact values may be determined by direct calculations.		
Note 2. A higher value, but not greater than 2,0, may be taken if it is verified by a buckling strength check of the partial plate field using non-linear FEA. The calculations are to be submitted to LR for approval.		

Table 11.2.5: Coefficients e_1, e_2, e_3 and factor B

Exponents e_1 to e_3 and factor B	Plate panel
e_1	$1 + \kappa_x^4$
e_2	$1 + \kappa_y^4$
e_3	$1 + \kappa_x \kappa_y \kappa_\tau^2$
B σ_x and σ_y positive (compression stress)	$(\kappa_x \kappa_y)^5$
B σ_x or σ_y negative (tension stress)	1

2.11.2 Proof is to be provided that the following condition is complied with for the single plate field a b :

$$\left(\frac{|\sigma_x| S}{\kappa_x \sigma_0} \right) e_1 + \left(\frac{|\sigma_y| S}{\kappa_y \sigma_0} \right) e_2 - B \left(\frac{\sigma_x \sigma_y S^2}{\sigma_0^2} \right) + \left(\frac{|\tau| S \sqrt{3}}{\kappa_\tau \sigma_0} \right) e_3 \leq 1,0$$

The first two terms and the last term of the above condition shall not exceed 1,0.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

The reduction factors κ_x , κ_y and κ_z are given in Table 11.2.6 Buckling and reduction factors for plane elementary plate panels.

Where $\sigma_x \leq 0$ (tension stress), $\kappa_x = 1,0$.

Where $\sigma_y \leq 0$ (tension stress), $\kappa_y = 1,0$.

The exponents e_1 , e_2 and e_3 as well as the factor B are to be taken as given by Table 11.2.5 Coefficients e_1 , e_2 , e_3 and factor B .

5		—		$K = K_\tau \sqrt{3}$	$\kappa_\tau = 1$ for $\lambda \leq 0,84$
			$\alpha \geq 1$	$K_\tau = \left(5,34 + \frac{4}{\alpha^2} \right)$	$\kappa_\tau = \frac{0,84}{\lambda}$ for $\lambda > 0,84$
			$0 < \alpha < 1$	$K_\tau = \left(4 + \frac{5,34}{\alpha^2} \right)$	
Explanations for boundary conditions					
<div><div><div></div></div><div>plate edge free</div></div> <div><div><div></div></div><div>plate edge simply supported</div></div>					

2.12 Webs and flanges of primary supporting members

2.12.1 For non-stiffened webs and flanges of primary supporting members, sufficient buckling strength, as for the hatch cover top and lower plating, is to be demonstrated according to Pt 3, Ch 11, 2.11 Buckling strength of hatch cover structures.

2.13 Longitudinal and transverse secondary stiffeners

2.13.1 It is to be demonstrated that the continuous longitudinal and transverse stiffeners of partial and total plate fields comply with the conditions set out in Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners and Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners.

2.14 Effective width of top and lower hatch cover plating

2.14.1 For demonstration of buckling strength according to Pt 3, Ch 11, 2.15 Lateral buckling of secondary stiffeners and Pt 3, Ch 11, 2.16 Torsional buckling of secondary stiffeners, the effective width of plating may be determined by the following formulae:

$$b_m = \kappa_x b \text{ for longitudinal stiffeners}$$

$$a_m = \kappa_y a \text{ for transverse stiffeners}$$

see also Figure 11.2.4 General arrangement of panel.

The effective width of plating is not to be taken greater than the value obtained from Pt 3, Ch 11, 2.10 Strength calculations.

The effective width e'_m of stiffened flange plates of primary supporting members may be determined as follows:

(a) Stiffening parallel to web of primary supporting member:

$$b < e_m$$

$$e'_m = n b_m$$

n = integer number of stiffener spacings b inside the effective breadth e_m according to Pt 3, Ch 11, 2.10 Strength calculations

$$= \text{int}\left(\frac{e_m}{b}\right)$$

(b) Stiffening perpendicular to web of primary supporting member:

$$a \geq e_m$$

$$e'_m = n a_m < e_m$$

$$n = 2,7 \frac{e_m}{a} \leq l$$

e = width of plating supported according to Pt 3, Ch 11, 2.10 Strength calculations

For $b \geq e_m$ or $a < e_m$, respectively, b and a are to be exchanged.

a_m and b_m for flange plates are in general to be determined for $\psi = 1$.

Scantlings of plates and stiffeners are in general to be determined according to the maximum stresses $\sigma_x(y)$ at webs of primary supporting member and stiffeners, respectively. For stiffeners with spacing b under compression arranged parallel to primary supporting members, no value less than $0,25\sigma_o$ shall be inserted for $\sigma_x(y=b)$.

The stress distribution between two primary supporting members can be obtained by the following formula:

$$\sigma_x(y) = \sigma_{x1} \left\{ 1 - \frac{y}{e} \left[3 + c_1 - 4c_2 - 2\frac{y}{e} (1 + c_1 - 2c_2) \right] \right\}$$

where

$$c_1 = \frac{\sigma_{x2}}{\sigma_{x1}} \quad 0 \leq c_1 \leq 1$$

$$c_2 = \frac{1,5}{e} (e_{m1}'' + e_{m2}'') - 0,5$$

e_{m1}'' = proportionate effective breadth e_{m1} or proportionate effective width e_{m1}' of primary supporting member 1 within the distance e , as appropriate

e_{m2}'' = proportionate effective breadth e_{m2} or proportionate effective width e_{m2}' of primary supporting member 2 within the distance e , as appropriate

σ_{x1}, σ_{x2} = normal stresses in flange plates of adjacent primary supporting member 1 and 2 with spacing e , based on cross-sectional properties considering the effective breadth or effective width, as appropriate

y = distance of considered location from primary supporting member 1

Shear stress distribution in the flange plates may be assumed linearly.

Figure 11.2.4: General arrangement of panel

Figure 11.2.5: Stiffening parallel to web of primary supporting member

Figure 11.2.6: Stiffening perpendicular to web of primary supporting member

2.15 Lateral buckling of secondary stiffeners

2.15.1 The secondary stiffeners are to comply with the following criteria:

$$\frac{\sigma_a + \sigma_b}{\sigma_0} S \leq 1$$

where

σ_a = uniformly distributed compressive stress, in N/mm², in the direction of the stiffener axis

σ_a = σ_x for longitudinal stiffeners

σ_a = σ_y for transverse stiffeners

σ_b = bending stress, in N/mm², in the stiffener

M_0 = bending moment, in Nmm, due to the deformation w of stiffener, taken equal to:

$$M_0 = F_{Ki} \frac{p_z w}{c_f - p_z} \text{ with } (c_f - p_z) > 0$$

M_1 = bending moment, in Nmm, due to the lateral load p equal to:

$$M_1 = \frac{p b a^2}{24 \times 10^3} \text{ for longitudinal stiffeners}$$

$$M_1 = \frac{p a (n b)^2}{8 c_s \times 10^3} \text{ for transverse stiffeners}$$

n is to be taken equal to 1 for ordinary transverse stiffeners

p = lateral load, in kN/m²

F_{Ki} = ideal buckling force, in N, of the stiffener

$$F_{Kix} = \frac{\pi^2}{a^2} E I_x \times 10^4 \text{ for longitudinal stiffeners}$$

$$F_{Kiy} = \frac{\pi^2}{(n b)^2} E I_y \times 10^4 \text{ for transverse stiffeners}$$

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

I_x, I_y = net moments of inertia, in cm^4 , of the longitudinal or transverse stiffener, including effective width of attached plating according to Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating. I_x and I_y are to comply with the following criteria:

$$I_x \geq \frac{b t^3}{12 \times 10^4}$$

$$I_y \geq \frac{a t^3}{12 \times 10^4}$$

p_z = nominal lateral load, in N/mm^2 , of the stiffener due to σ_x , σ_y and τ

$$p_{zx} = \frac{t}{b} \left(\sigma_{xl} \left(\frac{\pi b}{a} \right)^2 + 2c_y \sigma_y + \sqrt{2} \tau_1 \right) \text{ for longitudinal stiffeners}$$

$$p_{zy} = \frac{t}{a} \left(2c_x \sigma_{xl} + \sigma_y \left(\frac{\pi a}{n b} \right)^2 \left(1 + \frac{A_y}{a t} \right) + \sqrt{2} \tau_1 \right) \text{ for transverse stiffeners}$$

$$\sigma_{xl} = \sigma_x \left(1 + \frac{A_x}{b t} \right)$$

c_x, c_y = factor taking into account the stresses perpendicular to the stiffener's axis and distributed variably along the stiffener's length

$$= 0,5 (1 + \psi) \text{ for } 0 \leq \psi \leq 1$$

$$= \frac{0,5}{1 - \psi} \text{ for } \psi < 0$$

A_x, A_y = net sectional area, in mm^2 , of the longitudinal or transverse stiffener, respectively, without attached plating for longitudinal stiffeners:

$$\frac{a}{b} \geq 2,0 \quad : m_1 = 1,47 \quad m_2 = 0,49$$

$$\frac{a}{b} < 2,0 \quad : m_1 = 1,96 \quad m_2 = 0,37$$

for transverse stiffeners:

$$\frac{a}{n b} \geq 0,5 \quad : m_1 = 0,37 \quad m_2 = \frac{1,96}{n^2}$$

$$\frac{a}{n b} < 0,5 \quad : m_1 = 0,49 \quad m_2 = \frac{1,47}{n^2}$$

$$w = w_0 + w_1$$

w_0 = assumed imperfection, in mm

$$w_{0x} \leq \min \left(\frac{a}{250}, \frac{b}{250}, 10 \right)$$

$$w_{0y} \leq \min \left(\frac{a}{250}, \frac{n b}{250}, 10 \right)$$

NOTE

For stiffeners sniped at both ends, w_0 must not be taken less than the distance from the mid point of plating to the neutral axis of the profile, including effective width of plating.

w_1 = deformation of stiffener, in mm, at midpoint of stiffener span due to lateral load p

In the case of uniformly distributed load, the following values for w_1 may be used:

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

$$w_1 = \frac{p b a^4}{384 \times 10^7 E I_x} \text{ for longitudinal stiffeners}$$

$$w_1 = \frac{5a p (n b)^4}{384 \times 10^7 E I_y c_s^2} \text{ for transverse stiffeners}$$

c_f = elastic support provided by the stiffener, in N/mm²

(a) For longitudinal stiffeners:

$$c_{fx} = F_{Kix} \frac{\pi^2}{a^2} (1 + c_{px})$$

$$c_{px} = \frac{1}{1 + \frac{0,91 \left(\frac{12 \times 10^4 I_x}{t^3 b} - 1 \right)}{c_{xa}}}$$

$$c_{xa} = \left(\frac{a}{2b} + \frac{2b}{a} \right)^2 \text{ for } a \geq 2b$$

$$c_{xa} = \left(1 + \left(\frac{a}{2b} \right)^2 \right)^2 \text{ for } a < 2b$$

(b) For transverse stiffeners:

$$c_{fy} = c_s F_{Kiy} \frac{\pi^2}{(n b)^2} (1 + c_{py})$$

$$c_{py} = \frac{1}{1 + \frac{0,91 \left(\frac{12 \times 10^4 I_y}{t^3 a} - 1 \right)}{c_{ya}}}$$

$$c_{ya} = \left(\frac{n b}{2a} + \frac{2a}{n b} \right)^2 \text{ for } n b \geq 2a$$

$$c_{ya} = \left(1 + \left(\frac{n b}{2a} \right)^2 \right)^2 \text{ for } n b < 2a$$

c_s = factor accounting for the boundary conditions of the transverse stiffener

= 1,0 for simply supported stiffeners

= 2,0 for partially constrained stiffeners

Z_{st} = net section modulus of stiffener (longitudinal or transverse), in cm³, including effective width of plating according to Pt 3, Ch 11, 2.14 Effective width of top and lower hatch cover plating.

If no lateral load p is acting, the bending stress σ_b is to be calculated at the mid point of the stiffener span for that fibre which results in the largest stress value. If a lateral load p is acting, the stress calculation is to be carried out for both fibres of the stiffener's cross-sectional area (if necessary for the biaxial stress field at the plating side).

2.16 Torsional buckling of secondary stiffeners

2.16.1 The longitudinal secondary stiffeners are to comply with the following criteria:

$$\frac{\sigma_X^S}{\kappa_T \sigma_o} \leq 1,0$$

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

where

κ_T = coefficient taken equal to:

$$\kappa_T = 1,0 \text{ for } \lambda_T \leq 0,2$$

$$\kappa_T = \frac{1}{\varphi + \sqrt{\varphi^2 - \lambda_T^2}} \text{ for } \lambda_T > 0,2$$

$$\Phi = 0,5 (1 + 0,21 (\lambda_T - 0,2) + \lambda_T^2)$$

λ_T = reference degree of slenderness taken equal to:

$$\lambda_T = \sqrt{\frac{\sigma_F}{\sigma_{KiT}}}$$

$$\sigma_{KiT} = \frac{E}{I_p} \left(\frac{\pi^2 I_\omega 10^2}{a^2} \varepsilon + 0,385 I_T \right), \text{ in N/mm}^2$$

For I_p , I_T , I_ω , see Figure 11.2.7 Dimensions of stiffener and Table 11.2.7 Moments of inertia

I_p = net polar moment of inertia of the stiffener, in cm^4 , related to the point C

I_T = net St.Venant's moment of inertia of the stiffener, in cm^4

I_ω = net sectorial moment of inertia of the stiffener, in cm^6 , related to the point C

ε = degree of fixation taken equal to:

$$\varepsilon = 1 + 10^{-3} \sqrt{\frac{a^4}{\frac{3}{4} \pi^4 I_\omega \left(\frac{b}{t^3} + \frac{4h_w}{3t^3} \right)}}$$

h_w = web height, in mm

t_w = net web thickness, in mm

b_f = flange breadth, in mm

t_f = net flange thickness, in mm

A_w = net web area equal to: $A_w = h_w t_w$

A_f = net flange area equal to: $A_f = b_f t_f$

$$e_f = h_w + \frac{t_f}{2}, \text{ in mm}$$

b = stiffener spacing, in mm

t = local net plate thickness of the attached plate, in mm.

Closing Arrangements for Shell, Deck and Bulkheads

Sections with bulb or flange	$\left(\frac{A_w h_w^2}{3} + A_f e_f^2\right) 10^{-4}$	$\frac{h_w t_w^3}{3 \times 10^4} \left(1 - 0,63 \frac{t_w}{h_w}\right) + \frac{b_f t_f^3}{3 \times 10^4} \left(1 - 0,63 \frac{t_f}{b_f}\right)$	for bulb and angle sections: $\frac{A_f^2 e_f^2 b_f^2}{12 \times 10^6} \left(\frac{A_f + 2,6 A_w}{A_f + A_w}\right)$ for tee sections: $\frac{b_f^3 t_f^2 e_f^2}{12 \times 10^6}$

2.16.2 For transverse secondary stiffeners loaded by compressive stresses and which are not supported by longitudinal stiffeners, sufficient torsional buckling strength is to be demonstrated analogously in accordance with this sub-Section.

2.17 Pontoon covers

2.17.1 The structural assessment of pontoon covers, as defined in Pt 3, Ch 11, 1.1 Application, is to be carried out by direct calculations, which are to be submitted for approval, using the minimum design pressures acting on the hatch covers defined in Table 11.2.8 Pontoon cover minimum design pressures. The permissible stress, deflection and buckling criteria are given in Table 11.2.10 Steel pontoon cover permissible stress, deflection and buckling criteria.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 2

Table 11.2.8: Pontoon cover minimum design pressures

For ships of 100 m in length and above:	
(a)	<p>Position 1 hatch covers located in the forward quarter of the ship's length shall be designed for wave pressures at the forward perpendicular, calculated from the following equation:</p> <p>Minimum design pressure, $p = 49,05 + 9,81 (L_H - 100)a$ in kN/m^2 where</p> <p>L_H is L for ships of not more than 340 m but not less than 100 m in length and equal to 340 m for ships of more than 340 m in length:</p> <p>$a = 0,0074$ for Type B freeboard ships</p> <p>$= 0,0363$ Ships assigned reduced freeboard</p> <p>The pressure, p, is to be reduced linearly to $34,3 \text{ kN/m}^2$ at the end of the forward quarter's length, as shown in Table 11.2.9 Summary of pontoon cover minimum design pressures</p> <p>The design pressure used for each hatch cover panel shall be that determined at its mid point location:</p>
(b)	All other position 1 hatch covers shall be designed to $34,3 \text{ kN/m}^2$
(c)	Position 2 hatch covers shall be designed to $25,5 \text{ kN/m}^2$
(d)	Where a position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, it may be designed to $34,3 \text{ kN/m}^2$
For ships 24 m in length:	
(a)	<p>Position 1 hatch covers located in the forward quarter of the ship's length shall be designed for wave pressures of $23,8 \text{ kN/m}^2$ at the forward perpendicular and reduced linearly to $19,6 \text{ kN/m}^2$ at the end of the forward quarter's length, as shown in Table 11.2.9 Summary of pontoon cover minimum design pressures.</p> <p>The design pressure used for each hatch cover panel shall be that determined at its mid point location</p>
(b)	All other position 1 hatch covers shall be designed to $19,6 \text{ kN/m}^2$
(c)	Position 2 hatch covers shall be designed to $14,7 \text{ kN/m}^2$
(d)	Where a position 1 hatchway is located at least one superstructure standard height higher than the freeboard deck, it may be designed to $19,6 \text{ kN/m}^2$
For ships between 24 m and 100 m in length, and for positions between FP and $0,25L$, wave pressures shall be obtained by linear interpolation of the values shown in Table 11.2.9 Summary of pontoon cover minimum design pressures	

Table 11.2.9: Summary of pontoon cover minimum design pressures

Deck location	Longitudinal position		
	FP	0,25 <i>L</i>	Aft of 0,25 <i>L</i>
<i>L</i> >100 m			
Freeboard deck	Equation given in Table 11.2.8 Pontoon cover minimum design pressures	34,3 kN/m ²	34,3 kN/m ²
Superstructure deck	34,3 kN/m ²		25,5 kN/m ²
	<i>L</i> = 100 m

<p>b = length of panel (longer panel dimension), in mm, in transverse direction, see Figure 11.2.8 Cover with stiffening fitted normal to the axis of primary bending</p> <p>s = spacing of webs and stiffeners (shorter panel dimension), in mm</p> <p>t = thickness of plating, in mm</p> <p>σ_{ac} = corrected critical buckling stress, in N/mm²</p> <p>σ_b = the compressive bending stress, in N/mm², in the steel cover plating, calculated by taking the cover as a loaded beam simply supported at its ends</p> <p>σ_c = critical buckling stress of panel, in N/mm²</p> <p>σ_o = yield stress of cover plating material, in N/mm²</p> <p>$\sigma_c = 18,6 R_c \left(\frac{t}{b}\right)^2 \times 10^4 \text{ N/mm}^2$</p> <p>$\sigma_{ac} = \sigma_o \left(1 - \frac{\sigma_o}{4 \sigma_c}\right) \text{ N/mm}^2$</p> <p>(a) Where primary bending stress acts on longer panel edge b, see Figure 11.2.8 Cover with stiffening fitted normal to the axis of primary bending:</p> $\frac{\sigma_c}{\sigma_b} \left(\text{or } \frac{\sigma_{ac}}{\sigma_b} \right) \geq 1,3 \quad \text{where } R_c = \left(\frac{s}{b} + \frac{b}{s} \right)^2$ <p>Where primary bending stress acts on shorter panel edge s:</p> $\frac{\sigma_c}{\sigma_b} \left(\text{or } \frac{\sigma_{ac}}{\sigma_b} \right) \geq 1,2 \quad \text{where } R_c = 4 \left(\frac{b^2}{s^2} \right)$ <p>If $\sigma_c > 0,5 \sigma_o$, then corrected value σ_{ac} is used</p> <p>It is recommended that $\frac{b}{s} < 5,0$</p> <p>(b) Where covers are stiffened in two directions by a grillage formation, buckling checks are to be carried out as per (a) above for bending stresses acting on both the longer and shorter edges of the panel</p> <p>For the derivation of the section modulus for primary members, an effective width of plating to achieve a balanced section is to be adopted</p> <p>However, a greater width of plating in accordance with Pt 3, Ch 3, 3.2 Geometric properties of section may be adopted where this is suitably stiffened in the directions being considered from the buckling aspect</p>			

Figure 11.2.8: Cover with stiffening fitted normal to the axis of primary bending

2.17.2 The gross thickness of the plating of steel pontoon covers is to be not less than the greater of:

- (a) $t = 0,01s$ mm
- (b) $t = 6,0$ mm as required by Table 11.2.8 Pontoon cover minimum design pressures

where

s = stiffener spacing in mm

t = thickness as required by Pt 3, Ch 11, 2.17 Pontoon covers.

2.17.3 The gross scantlings of steel pontoon cover primary and secondary webs or stiffeners are to be not less than would be required to satisfy the requirements of Table 11.2.11 Steel pontoon cover webs and stiffeners. Alternatively, scantlings may be determined by direct calculations, which are to be submitted for approval. In no case are the stresses and deflections given in Table 11.2.10 Steel pontoon cover permissible stress, deflection and buckling criteria to be exceeded.

**Figure 11.2.9: Diagrammatic profile of web or stiffener or portable beam**

■ Section 3

Hatch beams and wood covers

3.1 Portable hatch beams

3.1.1 The section modulus and moment of inertia of portable web plate beams stiffened at their upper and lower edges by continuous flat bars are to satisfy the requirements of Pt 3, Ch 11, 2.17 Pontoon covers for pontoon covers. Alternatively, direct calculations may be used, provided the requirements of Pt 3, Ch 11, 2.17 Pontoon covers for pontoon covers are complied with.

3.1.2 The ends of web plates are to be doubled, or inserts fitted for at least 180 mm along length of web.

3.1.3 At beams which carry the ends of wood or steel hatch covers, a vertical 50 mm flat is to be arranged on the upper face plate. The width of bearing surface for hatch covers is to be not less than 65 mm.

3.1.4 Carriers or sockets, or other suitable arrangements, of suitable construction are to provide means for the efficient fitting and securing of portable hatch beams. The width of bearing surface is to be not less than 75 mm.

3.1.5 Sliding hatch beams are to be provided with an efficient device for locking them in their correct fore and aft positions when the hatchway is closed.

3.2 Wood covers

3.2.1 Wood covers are to have a finished thickness of not less than 60 mm in association with an unsupported span of not more than 1,5 m. Where the 'tween deck height measured vertically on the centreline of the ship from 'tween deck to underside of the hatch cover stiffeners on deck above, exceeds 2,6 m, the thickness of the wood covers is to be increased at the rate of 16,5 per cent per metre excess in 'tween deck height.

3.2.2 The ends of all wood hatch covers are to be protected by encircling galvanised steel bands, about 65 mm wide and 33 mm thick, efficiently secured.

■ Section 4

Hatch cover securing arrangements and tarpaulins

4.1 Cargo oil tank and adjacent spaces

4.1.1 For access hatchways to cargo oil tanks and adjacent spaces, see Pt 3, Ch 11, 7 Tanker access arrangements and closing appliances.

4.2 Steel covers – Clamped and gasketed

4.2.1 These requirements, unless stated otherwise, apply to steel hatch covers in Positions 1 and 2 fitted with gaskets and securing devices and situated above dry cargo holds.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 4

4.2.2 Where steel hatch covers are fitted to hatch openings on weather decks, the arrangements are to be such that weathertightness can be maintained. A sufficient number of securing devices is to be provided at each side of the hatch cover, considering the requirements of Pt 3, Ch 11, 2.9 Net scantling of primary supporting members. This applies also to hatch covers consisting of several parts.

4.2.3 The weight of the covers and weather loading may be transmitted to the ship's structure by means of continuous steel to steel contact of the cover skirt plate with the ship's structure in association with a maximum bearing pressure of 200 kgf/cm². Alternatively the weight may be transmitted by means of defined bearing pads. For covers loaded by containers or other cargo, the total load together with inertial forces generated by the ship's motion, are to be transmitted by means of defined bearing pads only.

4.2.4 For the design of the securing devices against shifting, the horizontal mass forces $F_h = m a$ are to be calculated with the following accelerations:

$$a_x = 0,2 g \text{ in longitudinal direction}$$

$$a_y = 0,5 g \text{ in transverse direction}$$

$$m = \text{sum of mass of cargo lashed on the hatch cover and mass of hatch cover.}$$

4.2.5 For the transmission of the support forces resulting from the load cases specified in Pt 3, Ch 11, 2.3 Load model and of the horizontal mass forces specified in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, hatch cover supports are to be provided, which are to be designed such that the nominal surface pressures do not, in general, exceed the following values:

$$p_{n \max} = d p_n, \text{ in N/mm}^2$$

$$d = 3,75 - 0,015L$$

$$d_{\max} = 3,0$$

$$d_{\min} = 1,0 \text{ in general}$$

$$= 2,0 \text{ for partial loading conditions, see Pt 4, Ch 8, 11.2 Direct calculations}$$

$$p_n = \text{see Table 11.4.1 Permissible nominal surface pressure } p_n$$

$$= \text{For metallic supporting surfaces not subjected to relative displacements, the nominal surface pressure applies:}$$

$$p_{n \max} = 3 p_n, \text{ in N/mm}^2$$

$$= \text{The supports are to be designed such that the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection are not exceeded.}$$

Table 11.4.1: Permissible nominal surface pressure p_n

Support material	p_n in N/mm ² when loaded by	
	Vertical force	Horizontal force (on stoppers)
Hull structural steel	25	40
Hardened steel	35	50
Plastics materials on steel	50	—

4.2.6 Drawings of hatch cover supports which specify the permitted maximum pressure related to long-term stress, given by the material manufacturer, must be submitted.

4.2.7 Where large relative displacements of the supporting surfaces of hatch cover supports are to be expected, the use of material having low wear and frictional properties is recommended. If necessary, sufficient abrasive strength may be shown by tests demonstrating an abrasion of support surfaces of not more than 0,3 mm per year in service, at a total distance of shifting of 15 000 m/year.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 4

4.2.8 The substructures of the hatch cover supports must be of such a design that a uniform pressure distribution is achieved. Irrespective of the arrangement of stoppers, the supports must be able to transmit the following force P_h in the longitudinal and transverse direction:

$$P_h = \mu \frac{P_v}{\sqrt{d}}$$

where

P_v = vertical supporting force

μ = frictional coefficient

= 0,5 in general

For non-metallic, low-friction support materials on steel, the friction coefficient may be reduced, but is not to be less than 0,35. The substructures are to be designed such that the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection are not exceeded.

4.2.9 For substructures and adjacent structures of supports subjected to horizontal forces P_h , as defined in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, a fatigue strength analysis is to be carried out.

4.2.10 Hatch covers are to be sufficiently secured against horizontal shifting. Stoppers are to be provided for hatch covers on which cargo is carried. The greater of the loads resulting from Pt 3, Ch 11, 2.3 Load model and Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed is to be applied for the dimensioning of the stoppers and their substructures. The permissible stress in stoppers and their substructures in the cover and in the coamings is to be determined according to Pt 3, Ch 11, 2.4 Allowable stress and deflection. In addition, the provisions in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed are to be observed.

4.2.11 The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements. Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and are to be made of a corrosion-restraint material or suitably protected against corrosion.

4.2.12 Special consideration is to be given to the gasket and securing arrangements in ships with large relative movements between cover and ship structure or between cover elements. The relative horizontal and vertical deflections are to be calculated and submitted with the hatch cover plans. Where applicable, deflections due to thermal effects and internal pressure loads are also to be included.

4.2.13 The suitability of the gasket material and the securing adhesive is the responsibility of the Builder and Owner. When selecting such material, consideration is to be given to its suitability for the environmental conditions likely to be experienced by the ship and its compatibility with the cargo carried. The material and form of gasket selected is to be considered in conjunction with the type of cover, the securing arrangement and the expected relative movement between cover and ship structure. The gasket is to be effectively secured to the cover.

4.2.14 Drainage is to be arranged inside the line of gasket by means of a gutter bar or vertical extension of the hatch side and end coaming; drain openings are to be provided at appropriate positions on the drain channels. This requirement need not be complied with for special ships carrying container cargoes when the requirements of Pt 4, Ch 8, 11 Hatch covers are satisfied.

4.2.15 Where the arrangement includes continuous steel to steel contact between hatch cover and coaming or between hatch cover and ship structure or at cross-joints, drainage on both sides of the gasket is to be provided.

4.2.16 Drain openings are to be arranged at the ends of drain channels and are to be provided with non-return valves for preventing ingress of water from outside.

The following requirements are to be complied with:

- (a) If manufactured from steel, the minimum drain pipe wall thickness is to be not less than 4,5 mm.
- (b) If not manufactured from steel, details of the drain, including the material specification, method of manufacture and details of any tests carried out, are to be submitted for consideration.
- (c) The drains are to be securely attached to the hatch coaming and adequately protected if in an exposed position.
- (d) When the drain is fitted to a hold also designed to carry liquids, a shut-off valve is to be incorporated into the assembly.
- (e) Drain openings in hatch coamings are to be arranged with sufficient distance to areas of stress concentration (e.g. hatch corners, transitions to crane posts).

4.2.17 Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings. The securing devices are not to have a vertical clearance but are to be pre-tensioned when the cover is in the closed position. The devices are also to be arranged in close proximity horizontally to the gasket. Arrangement and spacing are to be determined with due attention to the effectiveness for weathertightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices. A minimum of two securing devices for each side of a panel are to be fitted. The securing devices should be arranged as close to the panel corners as is practicable.

4.2.18 Between cover and coaming and at cross-joints, a gasket pressure sufficient to obtain weathertightness is to be maintained by the securing devices. This pressure is to be specified. Securing devices of a design other than rod or bolts will be specially considered, see Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed.

4.2.19 The net sectional area of each securing device is to be not less than:

$$A = \frac{1,4S_1W_1}{50f} \text{ cm}^2 \left(\frac{1,4S_1W_1}{5,1f} \text{ cm}^2 \right)$$

where

$$f = \left(\frac{\sigma_c}{235} \right)^e$$

S_1 = spacing between securing devices, in metres, not to exceed 6 m and not to be taken less than 2 m

W_1 = the gasket loading per unit length, in N/cm (kgf/cm), but not less than 50 N/cm (5,1 kgf/cm)

σ_c = specified minimum upper yield stress in N/mm² (kgf/mm²) of the steel used for cleats or securing devices, to be taken not greater than 70 per cent of the ultimate tensile strength

e = 0,75 for $\sigma_c \geq 235$ (24)

= 1,0 for $\sigma_c < 235$ (24).

4.2.20 Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 m² in area.

4.2.21 In order to ensure compression between gasket and compression bar along the full length, the cover edge stiffness is to be examined. The inertia of the cover edge is to be not less than:

$$I_E = 0,6W_1 S_1^4 \text{ cm}^4$$

$$(I_E = 5,89W_1 S_1^4 \text{ cm}^4)$$

where W_1 and S_1 are as defined in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed.

4.2.22 Securing devices are to be constructed of reliable design and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

4.2.23 Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

4.2.24 Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

4.2.25 The cross-joints of multi-panel covers are to be arranged with wedges, or locators (male and female) to retain the hatch covers in the correct sealing position, the number and spacing is to be arranged to suit the size and type of cover, gasket arrangements and stiffness of cover edges at cross-joints. Means are also to be provided to prevent excessive relative vertical deflections between loaded and unloaded panels. The arrangement of the gasket retaining angle and the compression bar at the cross-joints is to be such that the gasket compression is maintained between loaded and unloaded panels.

4.2.26 In addition to the requirements given above, all hatch covers, especially those carrying deck cargo are to be effectively secured against horizontal shifting due to the horizontal forces arising from the ship motions.

4.2.27 To prevent damage to hatch covers and ship structure, the location of stoppers is to be compatible with the relative movements between hatch covers and ship structure. The number should be as small as practically possible.

4.2.28 Towards the ends of the ship, vertical acceleration forces may exceed gravity forces. The resulting lifting forces must therefore be also considered when dimensioning the securing devices. Also lifting forces from cargo secured on the hatch cover during rolling are to be taken into account.

4.2.29 Hatch coamings and supporting structure are to be adequately stiffened to accommodate the loading from hatch covers and cargo carried thereon.

4.2.30 Upon completion of installation of hatch covers, a hose test with a pressure of water as specified in Table 1.9.1 Testing requirements in Chapter 1 is to be carried out. Alternative methods of tightness testing will be considered. This does not apply to covers with reduced securing arrangements as specified in Pt 4, Ch 8, 11 Hatch covers.

4.2.31 All hatch covers are to be tested to prove satisfactory operation.

4.2.32 It is recommended that ships with steel hatch covers are supplied with an operation and maintenance manual including:

- (a) opening and closing instructions;
- (b) maintenance requirements and specifications for packings, securing devices and operating items;
- (c) cleaning instructions for the drainage system;
- (d) corrosion prevention instructions;
- (e) list of spare parts.

4.2.33 The spacing and size of securing devices in hatch covers for holds which may be flooded and used for ballast tanks and holds in OBO, ore or oil and similar types of ship are to correspond to the reaction forces at the cover edges found by calculation. The loading is to be as required by Pt 4, Ch 7, 12.4 Load model.

The permissible stress in the securing devices is not to exceed the following:

$$\sigma_e = 0,9 \times 235 f \text{ N/mm}^2$$

= where

f = material factor as defined in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed

σ = bending stress in N/mm²

σ_e = equivalent stress, in N/mm²

$$= \sqrt{(\sigma^2 + 3 \tau^2)}$$

τ = shear stress in N/mm²

4.2.34 On tank hatch covers in 'tween decks the maximum spacing of cleats is to be 600 mm, but cleats are to be arranged as close to the corners as practicable.

4.2.35 Steel hatch covers with special sealing arrangements, insulated covers, flush hatch covers, and covers having coamings less than required by Pt 3, Ch 11, 5.1 General, will be specially considered.

4.2.36 The material and weld specifications of stoppers and securing devices are to be shown in the drawings of the hatch covers.

4.2.37 Securing devices of special design in which significant bending or shear stresses occur may be designed as anti-lifting devices according to Pt 4, Ch 8, 11.2 Direct calculations. The packing line pressure, as defined in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, multiplied by the spacing between securing devices, as defined in Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, is to be applied as design load.

4.3 Portable covers – Tarpaulins and battening devices

4.3.1 At least two layers of tarpaulin in good condition are to be provided for each hatchway in Positions 1 and 2.

4.3.2 Tarpaulins are to be free from jute, waterproof and of ample strength. The minimum mass of the material before treatment is to be 0,65 kg/m² if the material is to be tarred, 0,60 kg/m² if to be chemically dressed, or 0,55 kg/m² if to be dressed with black oil. A certificate to this effect is to be supplied by the makers of the tarpaulins. Special consideration will be given to the use of synthetic materials for tarpaulins.

4.3.3 Cleats are to be of an approved pattern, at least 65 mm wide, with edges so rounded as to minimise damage to the wedges, and are to be spaced not more than 600 mm from centre to centre: the first and last cleats along each side or end are to be not more than 150 mm from the hatch corners. Cleats should be so set as to fit the taper of the wedges.

4.3.4 Battens and wedges shall be efficient and in good condition. Wedges are to be of tough wood, generally not more than 200 mm in length and 50 mm in width. They should have a taper of not more than 1 in 6 and should not be less than 13 mm at the point.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 5

4.3.5 For all hatchways in Positions 1 and 2, steel bars or other equivalent means are to be provided in order to secure each section of hatch covers efficiently and independently after the tarpaulins are battened down. Hatch covers of more than 1,5 m in length are to be secured by at least two such securing appliances. Where hatchway covers extend over intermediate supports, steel bars or their equivalent are to be fitted at each end of each section of covers. At all other hatchways in exposed positions on weather decks, ring bolts or other fittings suitable for lashings are to be provided.

4.4 Packing material

4.4.1 Packing material is to be suitable for all expected service conditions of the ship and is to be compatible with the cargoes to be transported. The packing material is to be selected with regard to dimensions and elasticity in such a way that expected deformations can be carried. Forces are to be carried by the steel structure only.

4.4.2 Packing material is to be compressed so as to give the necessary tightness effect for all expected operating conditions. Special consideration will be given to the packing arrangement in ships with large relative movements between hatch covers and coamings or between hatch cover sections.

Section 5 Hatch coamings

5.1 General

5.1.1 The height of coamings above the upper surface of the deck, measured above sheathing if fitted, for hatchways closed by portable covers secured weathertight by tarpaulins and battening devices, is to be not less than:

- 600 mm at Position 1,
- 450 mm at Position 2.

5.1.2 The height of coamings of hatchways situated in Positions 1 and 2 closed by steel covers fitted with gaskets and clamping devices are to be as specified in Pt 3, Ch 11, 5.1 General, but may be reduced, or the coamings may be omitted entirely, if the safety of the ship is not thereby impaired in any sea condition. Special attention will be given in such cases to the scantlings of the covers, to their gasketing and securing arrangements and to the drainage of recesses in the deck. The agreement of the National Authority concerned will also be required.

5.1.3 The height of coamings may be required to be increased on ships of Type 'B-100' or Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966*.

5.2 Construction

5.2.1 Vertical cargo hatch coamings 600 mm or more in height are to be stiffened on their upper edges by a horizontal bulb flat or equivalent which is to be not less than 180 mm in width for ships where L is greater than 75 m. Additional support is to be afforded by fitting brackets or stays from the bulb flat to the deck at intervals of not more than 3 m. Each bracket or stay is to be aligned with suitable underdeck stiffeners and is to have a softened nose.

5.2.2 Vertical coamings less than 600 mm in height are to be stiffened at their upper edge by a substantial rolled or fabricated section. Additional support is to be arranged as required by Pt 3, Ch 11, 5.2 Construction.

5.2.3 Cargo hatchways on other decks, in positions not specified in Pt 3, Ch 1, 6.5 Position 1 and Position 2, are to be suitably framed.

5.2.4 The scantlings and arrangements of hatch coamings acting as girders will be specially considered. The coamings are to be arranged with intermediate continuous horizontal stiffeners supported by the bracket stays.

5.2.5 Sloped cargo hatch coamings will be specially considered. In general, the sloped coaming arrangement is to be restricted to the hatch side coamings with vertical coamings at the ends. The sloped coaming is not to have a knuckle and the angle to the vertical is not to exceed 30°. The scantlings are to be in accordance with Pt 3, Ch 11, 5.2 Construction, Pt 3, Ch 11, 5.2 Construction and Pt 3, Ch 11, 5.3 Strength criteria, except that the end coamings are to be increased by 20 per cent for a distance of $0,15b$ from the side coamings where b is the width of the hatchway at the deck. Particular care is to be taken where the proposed loadings exceed those given in Pt 3, Ch 11, 2.3 Load model and Pt 3, Ch 3, 5 Design loading, and where the coamings are not in alignment with the topside tank vertical strake in bulk carriers.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 5

5.2.6 A radiused coaming plate at the corner junction of the longitudinal and transverse cargo hatch coamings is acceptable for ships where $L \leq 90$ m and the heights of coamings are not in excess of that specified in Pt 3, Ch 11, 5.1 General. Where $L > 90$ m the corner junctions are to be rectangular and arranged with continuation brackets as required by Pt 3, Ch 11, 5.2 Construction.

5.2.7 The deck plating is to extend inside the coamings and the side coamings are to be extended in the form of tapered brackets. A recommended arrangement is shown in Figure 11.5.1 Coaming continuation bracket - Recommended arrangement. Continuation brackets are also to be arranged athwartships in line with the hatch end coamings and the under deck transverse. In bulk carriers the athwartship brackets, in conjunction with the hatch end beams should be arranged to achieve a satisfactory overlap with the top side tank transverses. In cases where the hatch end beam is formed by the transverse bulkhead top stool the horizontal knuckle of the stool should be arranged well clear of the topside tank knuckle line.

Figure 11.5.1: Coaming continuation bracket - Recommended arrangement

5.2.8 In bulk carriers where the hatch side coaming does not align with the topside tank vertical strake the arrangement and scantlings will be specially considered. In general, suitable underdeck girders and cantilever brackets are to be arranged taking into consideration the hatch cover loading. The underdeck girders are to continue beyond the hatch end for a distance of $2H_c$ mm. Alternative arrangements incorporating bulkhead top stool structure or cross-deck structure will be considered.

5.2.9 Extension brackets or rails arranged approximately in line with the cargo hatch side coamings and intended for the stowage of steel covers are not to be welded to a deckhouse, masthouse or to each other unless they form part of the longitudinal strength members.

5.2.10 The arrangement and scantlings of continuous hatchway coamings on the strength deck will be specially considered. The material of the coamings is to comply with Table 2.2.1 Material classes and grades and Table 2.2.2 Steel grades in Pt 3, Ch 2 Materials and is to be of the same strength level as the deck plating. Discontinuous coamings of length greater than $0,09L$ are also to satisfy this requirement.

5.2.11 Where containers are carried on multi-panel hatch covers, the hatch coaming in way of the loaded panel will be required to be reinforced to resist the lateral loads imposed on the coaming due to rolling of the ship. Thrust blocks are to be fitted on the

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 5

coaming rest bar to prevent the covers from moving. Where one-piece hatch covers are fitted with locating devices, the coamings are to be reinforced in way of the locators.

5.2.12 Cut outs in the top of hatch coamings are to be avoided. Where these are necessary for the securing devices they are to be circular or elliptical in shape. Also any local reinforcements should be given a tapered transition in the longitudinal direction with a taper the rate of which should not exceed 1 in 3. Cut-outs and drain holes are to be avoided in the hatch side coaming continuation brackets. Where these are necessary the size, shape and position will be specially considered.

5.2.13 Material for hatch coamings is to be steel, according to the requirements for ship's hull. Alternative materials will be subject to special consideration.

5.2.14 Secondary stiffeners of hatch coamings are to be continuous over the breadth and length of hatch coamings.

5.2.15 Longitudinal hatch coamings with a length exceeding $0,1L$ m are to be provided with tapered brackets or equivalent transitions and a corresponding substructure at both ends. At the end of the brackets they are to be connected to the deck by full penetration welds of minimum 300 mm in length.

5.2.16 Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions. Structures under deck are to be checked against the load transmitted by coaming stays.

5.2.17 On ships carrying cargo on deck, such as timber, coal or coke, coaming stays are to be spaced not more than 1,5 m apart.

5.2.18 Coaming plates are to extend to the lower edge of the deck beams; they are to be flanged or fitted with face bars or half-round bars. Figure 11.5.2 Example for the extent of coaming plates gives an example.

Figure 11.5.2: Example for the extent of coaming plates

5.3 Strength criteria

5.3.1 The strength requirements in this Section are applicable to hatch coamings of stiffened plate construction.

5.3.2 The local net plate thickness of weather deck hatch coamings is not to be less than the larger of the following values:

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 5

$$t = 0,0142s \sqrt{\frac{p_A}{0,95 \sigma_o}} \text{ in mm}$$

$$t_{\min} = 6 + \frac{L_1}{100} \text{ in mm}$$

= where

s = stiffener spacing, in mm

$L_1 = L$ need not be taken greater than 300 metres

p_A = pressure, in kN/m², as defined in Pt 3, Ch 11, 2.3 Load model

= Longitudinal strength aspects are to be observed.

5.3.3 Secondary stiffeners of coamings must be continuous at the coaming stays. For stiffeners with both ends constrained, the elastic net section modulus Z in cm³ and net shear area A_s in cm², calculated on the basis of net thickness, are not to be less than:

$$Z = \frac{0,083}{\sigma_o} s l^2 p_A \text{ cm}^3$$

$$A_s = \frac{0,01s l p_A}{\sigma_o} \text{ cm}^2$$

= where

l = secondary stiffener span, in metres, to be taken as the spacing of coaming stays

s = stiffener spacing in mm

p_A = pressure, in kN/m², as defined in Pt 3, Ch 11, 2.3 Load model.

5.3.4 For sniped stiffeners at coaming corners, section modulus and shear area at the fixed support are to be increased by 35 per cent. The gross thickness of the coaming plate at the sniped stiffener end is not to be less than:

$$t = 19,6 \sqrt{\frac{0,001s p_A (l - 0,0005 s)}{\sigma_o}} \text{ in mm}$$

= where

p_A = pressure, in kN/m², as defined in Pt 3, Ch 11, 2.3 Load model.

5.3.5 Coaming stays are to be designed for the loads transmitted through them, and permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection.

5.3.6 The net section modulus Z of coaming stays, with a height of $h_s < 1,6$ m and which are to be designed for the load p_A , is not to be less than:

$$Z = \frac{526}{\sigma_o} e h^2 p_A \text{ in cm}^3$$

= where

e = spacing of coaming stays, in metres

p_A = pressure, in kN/m², as defined in Pt 3, Ch 11, 2.3 Load model.

5.3.7 Coaming stays of coamings having a height of 1,6 m or more are to be designed using direct calculations under consideration of the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection. The effective breadth of the coaming plate is not to be larger than the effective plate breadth according to Pt 3, Ch 11, 2.10 Strength calculations.

5.3.8 Coaming stays are to be supported by appropriate substructures. Face-plates may be included in the calculation only if an appropriate substructure is provided and welding ensures an adequate joint.

5.3.9 The web gross thickness of coaming stays at the root point is not to be less than:

$$t_w = \frac{2 e h_s p_A}{\sigma_o h_w} + t_c$$

= where

h_w = web height of coaming stay at its lower end, in metres

t_c = corrosion addition, in mm, according to Pt 3, Ch 11, 1.1 Application

p_A = pressure, in kN/m², as defined in Pt 3, Ch 11, 2.3 Load model.

5.3.10 Webs of coaming stays are to be connected to the deck by fillet welds on both sides with a throat thickness of $a = 0,44t_w$.

5.3.11 For coaming stays which transfer friction forces at hatch cover supports, sufficient fatigue strength is to be verified, see Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed.

5.3.12 Hatch coamings which are part of the longitudinal hull structure are to be designed according to the requirements for longitudinal strength in Pt 3, Ch 4 Longitudinal Strength.

5.3.13 For structural members welded to coamings and for cut-outs in the top of coamings, sufficient fatigue strength is to be verified.

5.4 Rest bars in hatchways

5.4.1 Rest bars are to provide at least 65 mm bearing surface and are to be aligned if required to suit the slope of the hatches.

5.5 Loading in excess of Rule requirements

5.5.1 For weather deck hatch side coamings forming part of a hatch side girder subjected to loading exceeding that defined in Pt 3, Ch 11, 2.3 Load model, see Pt 4, Ch 1, 4 Deck structure.

■ Section 6 Miscellaneous openings

6.1 Small hatchways on exposed decks

6.1.1 Hatches which:

- are designed for access to spaces below the deck;
- are capable of being closed weathertight or watertight, as applicable;
- have an opening 2,5 m² or less;
- are located on the exposed deck over the forward 0,25L of the ship's rule length;
- are on a ship of sea-going service of length 80 m or more, where the height of the exposed deck in way of the hatch is less than 0,1L or 22 m above the summer load waterline, whichever is the lesser;

are to comply with the requirements of Pt 3, Ch 11, 6.6 Small hatchways on exposed fore decks. All other small hatchways or access openings in the positions defined in Pt 3, Ch 11, 1.1 Application are to comply with the following requirements.

6.1.2 The number and size of hatchways and other access openings are to be kept to the minimum consistent with the satisfactory operation of the ship.

6.1.3 The height of coamings is to be in accordance with Pt 3, Ch 11, 5.1 General. Lower heights may be considered in relation to operational requirements and the nature of the spaces to which access is given.

6.1.4 Rope hatches may be accepted with reduced coamings, but generally not less than 380 mm, provided they are well secured and closed before the ship leaves port. A suitable notice is to be displayed at the hatch stating that it is to be closed whilst the ship is at sea.

6.1.5 The thickness of the coamings is to be not less than the Rule minimum thickness for the deck inside line of openings for that position, or 11 mm, whichever is the lesser. Stiffening of the coaming is to be appropriate to its length and height.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 6

6.1.6 Hatch covers are to be of steel, weathertight and generally hinged. The means of securing are to be such that weathertightness can be maintained in any sea condition. Where toggles are fitted, their diameter and spacing are to be in accordance with ISO Standard or equivalent.

6.1.7 Hinges are not to be used as securing devices unless specially considered.

6.1.8 The thickness of covers is to be not less than the Rule minimum thickness inside the line of openings for the deck at that point, or 8 mm, whichever is the lesser.

6.1.9 The covers are to be adequately stiffened.

6.1.10 To facilitate a swift and safe means of escape to the lifeboat and life raft embarkation deck, the following provisions apply to overhead hatches fitted along the escape routes addressed by SOLAS Reg. II-2/13:

- (a) escape hatches and their securing devices shall be of a type which can be opened from both sides;
- (b) the maximum force needed to open the hatch cover should not exceed 150 N; and
- (c) the use of a spring equalising, counterbalance or other suitable device on the hinge side to reduce the force needed for opening is acceptable.

6.1.11 Small hatches, including escape hatches, are to be situated clear of cargo containment areas, particularly in the case of offshore supply ships.

6.1.12 Where portable plates are required in decks for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced deck and are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.

6.1.13 Satisfactory means are to be provided to prevent inadvertent flooding of chain lockers. See Pt 3, Ch 13, 8.10 Structural requirements associated with anchoring and Pt 3, Ch 13, 8.10 Structural requirements associated with anchoring.

6.1.14 Where permitted by the National Authority, access hatch coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm.

6.2 Manholes and flush scuttles

6.2.1 Manholes and flush scuttles fitted in Positions 1 and 2, or within superstructures other than enclosed superstructures, are to be closed by substantial covers capable of being made watertight. Unless secured by closely spaced bolts, the covers are to be permanently attached.

6.3 Hatchways within enclosed superstructures or 'tween decks

6.3.1 The requirements of Pt 3, Ch 11, 6.1 Small hatchways on exposed decks are to be complied with where applicable.

6.3.2 Access hatches within a superstructure or deckhouse in Position 1 or 2 need not be provided with means for closing if all openings in the surrounding bulkheads have weathertight closing appliances.

6.4 Companionways, doors and accesses on weather decks

6.4.1 Companionways on exposed decks are to be of equivalent construction, weathertightness and strength to a deckhouse in the same position and effectively secured to the deck.

6.4.2 Access openings in:

- (a) bulkheads at ends of enclosed superstructures;
- (b) deckhouses or companionways protecting openings leading into enclosed superstructures or to spaces below the freeboard deck; and
- (c) deckhouse on a deckhouse protecting an opening leading to a space below the freeboard deck

are to be fitted with doors of steel or other equivalent material, permanently and strongly attached to the bulkhead and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead, and weathertight when closed. The doors are to be gasketed and secured weathertight by means of clamping devices or equivalent arrangements, permanently attached to the bulkhead or to the door. Doors are generally to open outwards and are to be capable of being operated and secured from both sides. The sill heights are to be as required by Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks. See also Pt 3, Ch 11, 7 Tanker access arrangements and closing appliances and Pt 4, Ch 9, 13 Access arrangements and closing appliances and Pt 4, Ch 11, 1 General and the Rules for Ships for Liquid Chemicals, Ch 3 Ship

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 6

Arrangements concerning access openings in tankers, chemical tankers and ore or oil ships. Double doors are to be equivalent in strength to the unpierced bulkhead, and in Position 1, a centre pillar is to be provided which may be portable.

6.4.3 Elsewhere doors may be of hardwood not less than 50 mm in thickness or of equivalent material and strength.

6.4.4 Fixed lights in doors in Positions 1 and 2 are to comply with the requirements for side scuttles as given in Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights and Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights. Hinged steel deadlights may be external.

6.4.5 The height of doorway sills above deck sheathing, if fitted, is to be not less than 600 mm in Position 1, and not less than 380 mm in Position 2.

6.4.6 Where access is provided from the deck above as an alternative to access from the freeboard deck, the height of sill into a bridge or a poop is to be not less than 380 mm. The same requirement applies to deckhouses on the freeboard deck. The sill height for doorways in a forecabin, if protecting a companionway, is to be 600 mm regardless of whether or not access is provided from above. If not protecting a companionway, the sill height may be 380 mm.

6.4.7 When the closing appliances of openings in superstructures and deckhouses do not comply with Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks, interior deck openings are to be treated as if exposed on the weather deck.

6.4.8 Where an access opening, in the top of a deckhouse situated on a raised quarterdeck, gives access below the freeboard deck or to an enclosed superstructure, the closing appliances in the surrounding bulkheads are not required to be gasketed, provided the raised quarterdeck is at least standard height, and the deckhouse is at least standard superstructure height.

6.4.9 The height of door sills may be required to be increased on ships of Type 'A', Type 'B-100' or Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966*.

6.4.10 Direct access from the freeboard deck to the machinery space through exposed casings is not permitted on ships of Type 'A', Type 'B-100' or Type 'B-60'. A door complying with Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks may, however, be fitted in an exposed machinery casing on these ships, provided that it leads to a space or passageway which is of equivalent strength to the casing and is separated from the machinery space by a second weathertight door complying with Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks. The outer and inner weathertight doors are to have sill heights of not less than 600 mm and 230 mm, respectively and the space between is to be adequately drained by means of a screw plug or equivalent.

6.4.11 For a Type 'A' ship with freeboards assigned greater than, or equal to, Type 'B', inner doors are not required for direct access to the engine-room.

6.4.12 If internal access is provided from a wheelhouse in Position 2, or below, to spaces below the weather deck either directly or through other spaces, the opening should be protected by a hinged weathertight cover adequately secured, fitted on a coaming appropriate to its position, or by an equivalent arrangement, and the space adequately drained.

6.4.13 In way of a moonpool, where a working or platform deck is provided below the weather deck, openings in the surrounding bulkheads are to be kept to a minimum. Access or companionway openings are to be provided with weathertight closing appliances as for an exposed superstructure bulkhead, with 600 mm high coamings.

6.4.14 Where portable plates are required in casings for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced bulkhead and are secured by gaskets and close spaced bolts at a pitch not exceeding five diameters.

6.4.15 The sill heights of accesses closed by covers which are secured by closely spaced bolts or otherwise kept permanently closed at sea will be specially considered.

6.4.16 Where permitted by the National Authority, companionway coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm. Where the wheelhouse is on the freeboard deck, or located in the forward quarter of the ship's length, with internal access below, a weathertight cover, fitted to a coaming not less than 230 mm high, is to be provided for the access. Alternatively, storm covers are to be provided for windows in exposed positions. The wheelhouse is to be adequately drained.

6.5 Side scuttles, windows and skylights

6.5.1 Side scuttles are defined as being round or oval openings with an area not exceeding 0,16 m².

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 6

- 6.5.2 Windows are defined as being rectangular openings generally, and round or oval openings with an area exceeding 0,16 m².
- 6.5.3 A plan showing the location of side scuttles and windows is to be submitted. Attention is to be given to any relevant Statutory Requirements of the National Authority of the country in which the ship is to be registered.
- 6.5.4 Side scuttles and windows together with their glasses and deadlights if fitted, are to be of an approved design or in accordance with a recognised National or International Standard, see also Pt 4, Ch 4, 6.3 Windows and side scuttles for offshore supply ships.
- 6.5.5 Side scuttles to spaces below the freeboard deck, or to spaces within the first tier of enclosed superstructures, or to first tier deckhouses on the freeboard deck protecting openings leading below or considered buoyant in stability calculations, are to be fitted with efficient, hinged, inside deadlights and capable of being effectively closed and secured watertight.
- 6.5.6 Deadlights are to be capable of being closed and secured watertight if fitted below the freeboard deck or weathertight if fitted above.
- 6.5.7 No side scuttle is to be fitted in such a position that its sill is below a line drawn parallel to the freeboard deck at side and having its lowest point 2,5 per cent of the breadth *B* above the load waterline corresponding to the summer freeboard (or timber summer freeboard if assigned), or 500 mm, whichever is the greater distance, see Fig. 11.6.1.
- 6.5.8 If the required damage stability or floatability calculations indicate that the side scuttles would become immersed at any intermediate stages of flooding or the final equilibrium waterline, these are to be of the non-opening type. Windows are not to be fitted in such locations.
- 6.5.9 Windows are not to be fitted in machinery space boundaries. However this does not preclude the use of glass in control rooms within the machinery space.
- 6.5.10 If fitted in a deckhouse in Position 1, windows are to be provided with strong, hinged, steel, weathertight storm covers. However, if there is an opening leading below deck in this deckhouse, this opening is to be treated as being on an exposed deck and is to be protected as required by Pt 3, Ch 11, 6.4 Companionways, doors and accesses on weather decks.
- 6.5.11 Windows are not to be fitted below the freeboard deck, in first tier end bulkheads or sides of enclosed superstructures, or in first tier deckhouses that are considered buoyant in stability calculations.
- 6.5.12 Side scuttles and windows at the shell in Position 2, protecting direct access below, are to be provided with strong permanently attached deadlights.
- 6.5.13 Side scuttles and windows at the shell in Position 2, not protecting direct access below, are to be provided with strong portable steel covers for 50 per cent of each size, with means for securing at each side scuttle and window.
- 6.5.14 Side scuttles and windows set inboard from the shell in Position 2, protecting direct access below, are either to be provided with strong permanently attached deadlights or, where they are accessible, strong permanently attached external steel storm covers instead of internal deadlights.
- 6.5.15 Side scuttles and windows set inboard from the shell in Position 2, not protecting direct access below, do not require deadlights or storm covers.
- 6.5.16 In Position 2, cabin bulkheads and doors are considered effective between side scuttles or windows and access below.
- 6.5.17 Windows in the shell, located at least one standard height of superstructure above the lowest Position 2 deck, are to be provided with strong portable internal storm covers for 25 per cent of each size of window, with means of securing being provided at each window.
- 6.5.18 Where windows are permitted in an exposed bulkhead on the weather deck in the forward 0,25L _L, strong external storm covers which may be portable and stored adjacent are to be provided.

6.5.19 Where the wheelhouse is in Position 2, in lieu of storm covers being provided for the wheelhouse windows, a weathertight cover, fitted to a coaming of not less than 230 mm in height around the internal stairway opening within the wheelhouse, may be accepted. If this arrangement is accepted, adequate means of draining the wheelhouse are to be provided.

6.5.20 If necessary, for practical considerations, the storm covers may be in two parts.

6.5.21 Deckhouses situated on a raised quarter deck may be treated as being in Position 2 as far as the provision of deadlights is concerned, provided the height of the raised quarter deck is equal to, or greater than, the standard height.

6.5.22 Skylights, where fitted, are to be of substantial construction and securely attached to their coamings. The height of the lower edge of opening is to be as required by Pt 3, Ch 11, 5.1 General. The scantlings of the coaming are to be as required by this Section or Pt 3, Ch 11, 5 Hatch coamings, as appropriate. The thickness of glasses in fixed or opening skylights is to be appropriate to their size and position as required for side scuttles or windows. Glasses in any position are to be protected from mechanical damage, and where fitted in Positions 1 or 2 are to be provided with robust deadlights or storm covers permanently attached. Cargo pump room and machinery space skylights are not to contain glass.

6.5.23 Skylights to cargo pump rooms are to be capable of being closed from outside the pump room.

6.5.24 Laminated toughened safety glass may also be used for windows but the total thickness will need to be greater than that required for the equivalent sized window using toughened safety glass. The equivalent thickness of laminated toughened safety glass is to be determined from the following formula:

$$T_{L1}^2 + T_{L2}^2 + \dots T_{Ln}^2 = T_S^2$$

where

n = number of laminates

T_L = thickness of glass laminate

T_S = thickness of toughened safety glass.

Alternative arrangements that do not meet the above thickness requirement will be specially considered, provided that equivalent strength and bending stiffness to that of a single, thermally toughened pane of thickness, t_s , can be demonstrated in a four-point bending test in accordance with EN-ISO 1288-3 or an equivalent recognised National or International Standard, using not less than ten samples. The lower limit of the 90 per cent confidence level interval for the laminated pane shall not be less than the same for monolithic toughened safety glass. Small scale punch test or ring-in-ring test methods shall not be used.

6.5.25 Rubber frames are not acceptable for windows in Positions 1 and 2, and are not generally acceptable in any other position in external casings. Any proposals to fit rubber frames are to be submitted for consideration, and are to be acceptable to the administration. The proposed locations, frame dimensions, glass thicknesses and the results of any tests carried out, are to be forwarded.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 6

6.6 Small hatchways on exposed fore decks

6.6.1 For the application of the following requirements, see Pt 3, Ch 11, 6.1 Small hatchways on exposed decks.

6.6.2 The number and size of hatchways and other access openings are to be kept to the minimum consistent with the satisfactory operation of the ship.

6.6.3 The height of coamings is to be in accordance with Pt 3, Ch 11, 5.1 General. Lower heights may be considered in relation to operational requirements and the nature of the spaces to which access is given.

6.6.4 Rope hatches may be accepted with reduced coamings, but generally not less than 380 mm, provided they are well secured and closed before the ship leaves port. A suitable notice is to be displayed at the hatch stating that it is to be closed whilst the ship is at sea.

6.6.5 Where permitted by the National Authority, access hatch coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable with a minimum height of 230 mm.

6.6.6 The thickness of the coamings is to be not less than the Rule minimum thickness for the deck inside line of openings for that position, or 11 mm, whichever is the lesser.

6.6.7 The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, normally not more than 170 to 190 mm from the upper edge of the coamings.

6.6.8 Hatches are to be fitted with primary securing devices such that their hatch covers can be secured in place and weather-tight by means of a mechanism employing any one of the following methods:

- (a) Butterfly nuts tightening onto forks (clamps),
- (b) Quick acting cleats, or
- (c) Central locking device.

Emergency escape hatches are excluded from options (a) and (b).

6.6.9 Dogs (twist tightening handles) with wedges are not acceptable as primary securing devices.

6.6.10 Escape hatches are to be capable of being opened from either side and are to have a quick-acting type securing device, e.g. one action wheel handle central locking device for latching/unlatching the hatch cover.

6.6.11 For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimise the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is not to be less than 16 mm. An example arrangement is shown in Figure 11.6.3 Example of a primary securing method.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 6

Figure 11.6.2: Arrangement of stiffeners

- (Note: Dimensions in millimeters)
1. butterfly nut
 2. bolt
 3. pin
 4. centre of pin
 5. fork (clamp) plate
 6. hatch cover
 7. gasket
 8. hatch coaming
 9. bearing pad welded on the bracket of a toggle bolt for metal to metal contact
 10. stiffener
 11. inner edge stiffener

Figure 11.6.3: Example of a primary securing method

6.6.12 The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with Figure 11.6.2 Arrangement of stiffeners, and of sufficient capacity to withstand the bearing force.

6.6.13 The primary securing method is to be designed and manufactured such that the designed compression pressure can be achieved by one person without the need of any tools.

6.6.14 For small rectangular steel hatch covers, the plate thickness, stiffener arrangement and scantlings are to be in accordance with Table 11.6.1 Scantlings for small steel hatch covers on exposed deck and Figure 11.6.2 Arrangement of stiffeners. Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points required in Pt 3, Ch 11, 6.6 Small hatchways on exposed fore decks, see Figure 11.6.2 Arrangement of stiffeners. Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener, see Figure 11.6.3 Example of a primary securing method.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 7

Table 11.6.1: Scantlings for small steel hatch covers on exposed deck

nominal size (mm x mm)	cover plate thickness (mm)	primary stiffeners	secondary stiffeners
		Flat bar (mm x mm); number	
630 x 630	8	–	–
630 x 830	8	100 x 8,1	–
830 x 630	8	100 x 8,1	–
830 x 830	8	100 x 10,1	–
1030 x 1030	8	120 x 12,1	80 x 8,2
1330 x 1330	8	150 x 12,2	100 x 10,2

6.6.15 For hatch covers constructed of materials other than steel, the required scantlings are to provide equivalent strength.

6.6.16 For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement are to be of equivalent strength to that of the small rectangular steel hatch covers described in Pt 3, Ch 11, 2.2 Stiffener arrangement.

6.6.17 For hatch covers located on the deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green sea will cause the cover to close. The hinges are normally to be located on the fore edge.

6.6.18 On small hatches located between the main hatches, for example between Numbers 1 and 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

6.6.19 Hatches, excluding emergency escape hatches, are to be fitted with an independent secondary securing device, e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

6.6.20 Small hatches, including escape hatches, are to be situated clear of cargo containment areas, particularly in the case of offshore supply ships.

6.6.21 Where portable plates are required in decks for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced deck and are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.

6.6.22 Satisfactory means are to be provided to prevent inadvertent flooding of chain lockers, see Pt 3, Ch 13, 8.10 Structural requirements associated with anchoring and Pt 3, Ch 13, 8.10 Structural requirements associated with anchoring.

Section 7

Tanker access arrangements and closing appliances

7.1 Materials

7.1.1 Covers for access hatches, tank cleaning and other openings to cargo tanks and adjacent spaces are to be manufactured from steel complying with the Rules for Materials.

7.1.2 Consideration will be given to the use of bronze, brass or other materials; however, aluminium alloy is not to be used for the covers of any openings to tanks.

7.1.3 Synthetic materials will be considered, taking into account their fire resistance and physical and chemical properties in relation to the intended operating conditions. Details of the properties of the material, the design of the cover and the method of manufacture are to be submitted for approval.

7.1.4 The hatch cover packing material is to be compatible with the cargoes to be carried and is to be efficiently held in place.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 7

7.2 Cargo tank access hatchways

7.2.1 Attention is drawn to IMO Resolutions concerning safe access to, and working in, large tanks.

7.2.2 Oiltight hatchways are to be kept to the minimum size required to provide reasonable access and ventilation. Where tanks are large or subdivided by wash bulkheads, additional hatchways may be required. In determining the size and location of hatchways, consideration should be given to the handling of materials and staging for maintenance in the tank.

7.2.3 The size and location of hatchways should also take into account access for personnel wearing breathing apparatus, and removal of injured personnel (possibly on a stretcher) from the bottom of the tank.

7.2.4 The height of hatch coaming is to be not less than 600 mm, measured above the upper surface of the freeboard deck, unless a lower height is permitted by the Administration of the country in which the ship is to be registered.

7.2.5 Taking account of sheer and camber, the height of any cargo tank hatch coaming is to be such as to ensure that the top of the hatch coaming is above the highest point of the tank over which it is fitted.

7.2.6 The height of the coaming may be required to be increased if this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966*.

7.2.7 The thickness of the coaming plate is to be not less than 10 mm, but may be required to be increased, and edge stiffening fitted, where the coaming height exceeds 600 mm.

7.2.8 Unstiffened plate covers are to be not less than 12,5 mm in thickness, but if the area of the cover exceeds 1,2 m² this thickness may be required to be increased or stiffening fitted.

7.2.9 Unstiffened covers are to be secured by fastenings spaced not more than 600 mm apart on circular hatchways. On rectangular hatchways the spacing of fastenings is generally not to exceed 450 mm, and the distance between hatch corners and adjacent fastenings is to be not more than 230 mm.

7.2.10 The arrangement of fastenings on stiffened hatchway covers and covers of special design will be specially considered.

7.2.11 Where the cover is hinged, adequate stiffening of the coaming and cover in way of the hinge is to be provided. In general, hinges are not to be used as securing devices for the cover.

7.3 Enlarged cargo tank access openings

7.3.1 Proposals to fit enlarged cargo tank accesses closed by bolted plate covers will be considered. Such openings may be of extended dimensions for ease of access and evacuation of personnel, see Pt 3, Ch 11, 7.2 Cargo tank access hatchways, and may incorporate a smaller access hatch for normal use constructed as required by Pt 3, Ch 11, 7.2 Cargo tank access hatchways.

7.3.2 The plate cover is to be not less than 15 mm in thickness and is to be secured by closely spaced studs to a ring of suitable dimensions, welded to the deck. The studs are not to penetrate the deck plating.

7.4 Miscellaneous openings

7.4.1 Small openings for tank cleaning, ullage and similar purposes may be closed by flush covers which are to be not less than 12,5 mm in thickness and secured by studs not more than 100 mm apart. Studs are to be arranged in a ring of suitable width and thickness attached to the deck, and are not to penetrate the deck plating.

7.4.2 Small diameter holes provided for staging wires are to be closed by plugs of an approved pattern. The plugs are to be provided with a thick washer of suitable material which is also compatible with the intended cargoes. Spare plugs equal to at least 10 per cent of the number of holes are to be provided and maintained on board, see also Pt 4, Ch 9, 4 Hull envelope plating. If these openings are threaded they are to be protected while in use with a protective sleeve of suitable material.

7.5 Access to spaces other than cargo tanks

7.5.1 Access to clean ballast or dry tanks and to cofferdams may be either by access hatch or by manhole generally complying with the preceding requirements.

7.6 Equivalents

7.6.1 Alternative access cover designs and securing arrangements will be considered on the basis of equivalence to the above requirements and taking into account any relevant National Requirements.

7.7 Other openings

7.7.1 For access to structure within cargo tanks, see Pt 4, Ch 9, 13 Access arrangements and closing appliances.

■ Section 8

Side and stern doors and other shell openings**8.1 Symbols**

8.1.1 The symbols used in this Section are defined as follows:

d = distance between closing devices, in metres

k = material factor, see Pt 3, Ch 2, 1.2 Steel, but is not to be taken less than 0,72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure

I = moment of inertia, in cm^4 , of the stiffener or girder, in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3, 3 Structural idealisation

σ = bending stress, in N/mm^2 (kgf/mm^2)

σ_e = equivalent stress, in N/mm^2 (kgf/mm^2)

$$= \sqrt{(\sigma^2 + 3 \tau^2)}$$

σ_o = minimum yield stress of the bearing material, in N/mm^2 (kgf/mm^2)

τ = shear stress, in N/mm^2 (kgf/mm^2).

8.2 General

8.2.1 These requirements cover cargo and service doors in the ship side (abaft the collision bulkhead) and stern area, below the freeboard deck and in enclosed superstructures.

8.2.2 For the requirements of bow doors, see Pt 4, Ch 2, 8 Bow doors and inner doors.

8.2.3 Side and stern doors are to be so fitted as to ensure tightness and structural integrity commensurate with their location and the surrounding structure, see also Pt 3, Ch 1, 6.3 Weathertight and Pt 3, Ch 1, 6.4 Watertight.

8.2.4 In general, and for passenger ships in particular, the lower edge of door openings is not to be below a line drawn parallel to the freeboard deck at side, which has at its lowest point at least 230 mm above the upper edge of the uppermost Load Line.

8.2.5 When the lower edge is below the line specified in Pt 3, Ch 11, 8.2 General, the arrangement will be specially considered. Special consideration is to be given to preventing the spread of leakage water over the deck. The reference to the uppermost Load Line is to be taken as the tropical fresh waterline or, if timber freeboards are assigned, the timber tropical fresh waterline.

8.2.6 Watertight doors below the freeboard deck, with the exception of pilot doors which are to open inwards, are to open outwards. Weathertight doors are generally to be arranged to open outwards, however inward opening doors will be considered provided these satisfy the requirements of Pt 3, Ch 11, 8.2 General.

8.2.7 Inward opening doors situated in the first two 'tween decks above the summer load waterline are to be fitted with a second independent securing device, such as a strongback or equivalent arrangement, capable of providing weathertight integrity. Where the consequences of water ingress due to failure of the door are minimal, such as a small pilot door giving access to a watertight trunk leading to the bulkhead deck, the required enhancements will be specially considered.

8.2.8 For passenger ships the following are also applicable:

- (a) Gangway, cargo and service ports fitted below the margin line, see Pt 3, Ch 3, 4.3 After peak bulkhead, are to satisfy the strength requirements given for side doors in this Section. They are to be effectively closed and secured watertight before the

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 8

ship leaves port, and are to be kept closed during navigation. Such ports are not to have their lowest point below the deepest subdivision Load Line.

- (b) Where the inboard end of a rubbish chute is below the margin line in a passenger ship, the inboard end cover is to be watertight and, in addition to the discharge flap interlock, a screwdown automatic non-return valve is to be fitted in an easily accessible position above the deepest subdivision. The valve is to be controlled from a position above the bulkhead deck and provided with an open/shut indicator, and kept closed when not in use. A suitable notice is to be displayed at the valve position.

8.2.9 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined as follows:

- (a) A securing device is used to keep the door closed by preventing it from rotating about its hinges or other pivoted attachments to the ship.
- (b) A supporting device is used to transmit external and internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.
- (c) A locking device locks a securing device in the closed position.

8.2.10 Ro-ro cargo spaces are spaces not normally subdivided in any way and extending to either a substantial length or the entire length of the ship, in which motor vehicles with fuel in their tanks for their own propulsion and/or goods (packaged or in bulk, in or on rail or road cars, vehicles (including road or rail tankers), trailers, containers, pallets, demountable tanks in or on similar stowage units or other receptacles) can be loaded and unloaded normally in a horizontal direction.

8.2.11 Special category spaces are those enclosed spaces above and below the bulkhead deck, into and from which vehicles can be driven and to which passengers have access, and which may be accommodated on more than one deck where total overall clear height for vehicles does not exceed 10 m.

8.3 Scantlings

8.3.1 In general the strength of side and stern doors is to be equivalent to the strength of the surrounding structure.

8.3.2 Door openings in the side shell are to have well rounded corners and adequate compensation is to be arranged with web frames at sides and stringers or equivalent above and below, see Pt 4, Ch 1, 5 Shell envelope plating.

8.3.3 Doors are to be adequately stiffened, and means are to be provided to prevent movement of the doors when closed. Adequate strength is to be provided in the connections of the lifting/manoeuvring arms and hinges to the door structure and to the ship structure.

8.3.4 The thickness of the door plating is to be not less than the shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum adjacent shell thickness.

8.3.5 Where stern doors are protected against direct wave impact by a permanent external ramp, the thickness of the stern door plating may be reduced by 20 per cent relative to the requirements of Pt 3, Ch 11, 8.3 Scantlings. Those parts of the stern door which are not protected by the ramp are to have the thickness of plating in full compliance with Pt 3, Ch 11, 8.3 Scantlings.

8.3.6 Where higher tensile steel is proposed, the plating thickness required in Pt 3, Ch 11, 8.3 Scantlings and Pt 3, Ch 11, 8.3 Scantlings may be reduced by \sqrt{k} .

8.3.7 The section modulus of horizontal or vertical stiffeners is to be not less than required for the adjacent shell framing using the actual stiffener spacing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and door stiffeners.

8.3.8 Where necessary, door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.

8.3.9 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load is the uniformly distributed external sea pressure, p_e , as defined in Pt 3, Ch 11, 8.8 Operating and Maintenance Manual. For minimum scantlings, p_e is to be taken as 25 kN/m² (2,55 tonne-f/m²) and the permissible stresses are as follows:

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 8

$$\tau = \frac{80}{k} \text{ N/mm}^2 \left(\frac{8,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2 \left(\frac{12,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2 \left(\frac{15,3}{k} \text{ kgf/mm}^2 \right)$$

8.3.10 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

8.3.11 The stiffness of the edges of the doors and the hull structure in way are to be sufficient to ensure weathertight integrity. Edge stiffeners/girders are to be adequately stiffened against rotation and are to have a moment of inertia not less than:

$$I = 0,8p_1 d^4 \text{ cm}^4$$

$$(I = 8p_1 d^4 \text{ cm}^4)$$

where

p_1 = packing line pressure along edges, not to be taken less than 50 N/cm (5,1 kgf/cm).

For edge girders supporting main door girders between securing devices, the moment of inertia is to be increased in relation to the additional force.

8.3.12 The buckling strength of primary members is to be specially considered.

8.3.13 All load transmitting elements in the design load path from door through securing and supporting devices into the ship structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

8.4 Doors serving as ramps

8.4.1 Where doors also serve as vehicle ramps, the plating and stiffeners are to be not less than required for vehicle decks, see Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles.

8.4.2 The design of the hinges for these doors should take into account the ship angle of trim or heel which may result in uneven loading of the hinges.

8.5 Arrangements for the closing, securing and supporting of doors

8.5.1 Doors are to be fitted with adequate means of closing, securing and support so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is generally not to exceed 3 mm.

8.5.2 Devices are to be simple to operate and easily accessible. They are to be of a design approved by Lloyd's Register for the intended purpose.

8.5.3 Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the securing devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.

8.5.4 Systems for door opening/closing and securing/locking are to be interlocked in such a way that they can only operate in a proper sequence. Hydraulic systems are to comply with Pt 5, Ch 14, 14 Hydraulic systems.

8.5.5 Means are to be provided to enable the doors to be mechanically fixed in the open position taking into account the self weight of the door and a minimum wind pressure of 1,5 kN/m² (0,153 tonne-f/m²) acting on the maximum projected area in the open position.

8.5.6 The spacing for cleats or closing devices should not exceed 2,5 m and there should be cleats or closing devices positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

8.5.7 Control and monitoring arrangements are to comply with the applicable requirements of Pt 6, Ch 2, 19 Ship safety systems.

8.6 Design loads

8.6.1 The design force considered for the scantlings of primary members, securing and supporting devices of side shell doors and stern doors are to be taken not less than:

(a) Design forces for securing or supporting devices of doors opening inwards:

External force:

$$P_e = A p_e + P_p \text{ kN (tonne-f)}$$

Internal force:

$$P_i = P_o + 10W \text{ kN}$$

$$(P_i = P_o + 1,02W \text{ tonne-f})$$

(b) Design forces for securing or supporting devices of doors opening outwards:

External force:

$$P_e = A p_e \text{ kN (tonne-f)}$$

Internal force:

$$P_i = P_o + 10W + P_p \text{ kN}$$

$$(P_i = P_o + 1,02W + P_p \text{ tonne-f})$$

(c) Design forces for primary members:

External force:

$$P_e = A p_e + 10W \text{ kN (tonne-f)}$$

Internal force:

$$P_i = P_o + 10W \text{ kN}$$

$$(P_i = P_o + 1,02W \text{ tonne-f})$$

whichever is the greater.

The symbols used are defined as follows:

p_e = external sea pressure, in kN/m^2 (tonne-f/ m^2), determined at the centre of gravity of the door opening and is not to be taken less than:

$$= \begin{aligned} &\text{for } Z_G < T \quad 10(T - Z_G) + 25 \text{ kN/m}^2 \\ &\quad (1,02(T - Z_G) + 2,55 \text{ tonne-f/m}^2) \\ &\text{for } Z_G \geq T \quad 25 \text{ kN/m}^2 \\ &\quad (2,55 \text{ tonne-f/m}^2) \end{aligned}$$

= For stern doors of ships fitted with bow doors, P_e is not to be taken less than:

$$p_{emin} = 0,6\lambda C_H (0,8 + 0,6L^{0,5})^2 \text{ kN/m}^2$$

$$(p_{emin} = 0,061\lambda C_H (0,8 + 0,6L^{0,5})^2 \text{ tonne-f/m}^2)$$

T = summer draught, in metres

Z_G = height of the centre of area of the door, in m, above the base line

L = length of ship, but need not be taken greater than 200 m

λ = coefficient depending on the area where the ship is intended to be operated:

= 1 for sea-going ships

= 0,8 for ships operated in coastal waters

= 0,5 for ships operated in sheltered waters

C_H = 0,0125 L for $L < 80$ m

= 1 for $L \geq 80$ m

A = area, in m², of the door opening

W = weight of the door, in tonnes

P_p = total packing force, kN (tonne-f). When packing is fitted, the packing line force per unit length is to be specified, normally not to be taken less than: 5 kN/m (0,51 tonne-f/m)

P_o = the greater of P_c and 5A kN (0,5A tonne-f)

P_c = accidental force, in kN (tonne-f), due to loose cargo, etc. to be uniformly distributed over the area A and not to be taken less than 300 kN (30,6 tonne-f). For small doors such as bunker doors and pilot doors, the value of P_c may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental force due to loose cargoes.

8.7 Design of securing and supporting devices

8.7.1 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

$$\tau = \frac{80}{k} \text{ N/mm}^2 \left(\frac{8,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2 \left(\frac{12,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2 \left(\frac{15,3}{k} \text{ kgf/mm}^2 \right)$$

The terms 'securing device' and 'supporting device' are defined in Pt 4, Ch 2, 8.2 General.

8.7.2 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k} \text{ N/mm}^2 \left(\frac{12,7}{k} \text{ kgf/mm}^2 \right)$$

8.7.3 For steel to steel bearings in securing and supporting devices, the normal bearing pressure is not to exceed $0,8\sigma_o$, see Pt 3, Ch 11, 8.1 Symbols. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The normal bearing pressure is to be calculated by dividing the design force by the projected bearing area.

8.7.4 The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not generally to be included in these calculations.

8.7.5 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be considered in the calculation of the reaction forces acting on the devices.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 9

8.7.6 The number of securing and supporting devices is generally to be the minimum practicable whilst complying with Pt 3, Ch 11, 8.5 Arrangements for the closing, securing and supporting of doors and taking account of the available space in the hull for adequate support.

8.7.7 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, without exceeding, by more than 20 per cent, the permissible stresses as defined in Pt 3, Ch 11, 8.7 Design of securing and supporting devices.

8.8 Operating and Maintenance Manual

8.8.1 An Operating and Maintenance Manual for the doors is to be provided on board and is to contain necessary information on:

- (a) main particulars and design drawings,
- (b) service conditions, e.g. service area restrictions, acceptable clearances for supports,
- (c) maintenance and function testing,
- (d) register of inspections, repairs and renewals.

8.8.2 For passenger/vehicle ferries and roll on-roll off cargo ships, see Pt 4, Ch 2, 1.1 Application, an Operating and Maintenance Manual for the doors, as defined in Pt 4, Ch 2, 8.7 Operating and Maintenance Manual, is to be provided on board instead of that required by Pt 3, Ch 11, 8.8 Operating and Maintenance Manual.

8.8.3 The Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.

8.8.4 Documented operating procedures for closing and securing the doors are to be kept on board and posted at an appropriate place.

■ Section 9

Watertight doors in bulkheads below the freeboard deck

9.1 Openings in bulkheads

9.1.1 Certain openings below the freeboard deck are permitted, but these must be kept to a minimum and provided with means of closing to watertight standards. All such openings are to be to the satisfaction of the Surveyor.

9.2 Watertight doors

9.2.1 Watertight doors are to be of equivalent strength to the unpierced bulkhead, efficiently constructed and fitted, and are to be capable of being closed watertight when the ship is listed up to 15° either way. They are to be operated under working conditions and hose tested in place, see Table 1.9.1 Testing requirements in Chapter 1.

9.2.2 The scantlings of the watertight doors are to comply with Pt 4, Ch 1, 9 Bulkheads using the actual stiffener spacing of the door.

9.2.3 The scantlings of the frames of the watertight doors are to satisfy the requirements of watertight bulkheads given in Table 1.9.1 Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1, 9 Bulkheads taking into account the arrangement of door stiffeners and securing arrangements.

9.2.4 Watertight doors of the sliding type are to be capable of being operated both at the door itself and from an accessible position above the bulkhead deck. Means are to be provided at all the remote operating positions to indicate whether the door is open or closed. Doors are to be capable of being remotely closed by power from the bridge. The relevant regulations regarding openings in watertight bulkheads, contained in the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments, are also to be complied with.

9.2.5 Hinged watertight doors of approved pattern may be fitted in 'tween decks in approved positions. The hinges of these doors are to be fitted with gunmetal pins or gunmetal bushes.

Closing Arrangements for Shell, Deck and Bulkheads

Part 3, Chapter 11

Section 10

9.2.6 The frames of vertical watertight doors shall have no groove at the bottom in which dirt might lodge and prevent the door closing properly.

9.2.7 Means are to be provided on the navigating bridge to indicate whether the watertight doors are open or closed. A notice is to be affixed to both sides of each such door or hatch cover to the effect that it is not to be left open.

9.2.8 In passenger ships the number and construction of the watertight doors in bulkheads will be specially considered. Each watertight door is to be tested, see Table 1.9.1 Testing requirements. The test may be carried out either before or after the door is fitted. The relevant regulations regarding openings in watertight bulkheads in passenger ships, contained in the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments, are also to be complied with.

■ Section 10

External openings and openings in watertight bulkheads and internal decks in cargo ships

10.1 Shell and watertight subdivision openings

10.1.1 In addition to the requirements of Pt 3, Ch 11, 8 Side and stern doors and other shell openings and Pt 3, Ch 11, 9 Watertight doors in bulkheads below the freeboard deck, for cargo ships of 80 m in length and above, the relevant regulations concerning shell and watertight subdivision openings contained in the *International Convention for the Safety of Life at Sea, 1974*, and amendments thereto are also to be complied with.

Section

- 1 **General**
- 2 **Ventilators**
- 3 **Air and sounding pipes**
- 4 **Scuppers and sanitary discharges**
- 5 **Air pipes, ventilator pipes and their securing devices located on the exposed fore deck**

■ *Section 1* **General**

1.1 Application

1.1.1 This Chapter applies to all ship types detailed in Pt 4 Ship Structures (Ship Types), and provides requirements for ventilators, air and sounding pipes and overboard discharges.

1.1.2 The requirements conform, where relevant, with those of the *International Convention on Load Lines, 1966*. Reference should also be made to any additional requirements of the National Authority of the country in which the ship is to be registered and to the relevant regulations of the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments.

1.2 Protection

1.2.1 In all cargo spaces and other areas where mechanical damage is likely, all air and sounding pipes, scuppers and discharges, including their valves, controls and indicators, are to be well protected. This protection is to be of steel or other equivalent material.

■ *Section 2* **Ventilators**

2.1 General

2.1.1 Ventilators located on the exposed deck over the forward 0,25L of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0,1L or 22 m above the summer load waterline, whichever is the lesser, are to comply with the requirements of Pt 3, Ch 12, 5 Air pipes, ventilator pipes and their securing devices located on the exposed fore deck. All other ventilators are to comply with the following requirements.

2.1.2 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.

2.1.3 Ventilators from deep tanks and tunnels passing through 'tween decks are to have scantlings suitable for withstanding the pressures to which they may be subjected, and are to be made watertight.

2.1.4 For height and location of cargo tank vent outlets, see Pt 5, Ch 15, 5 Cargo tank venting, purging and gas-freeing and see also Ch 8, 2 Pressure relief systems and Ch 8, 2 Pressure relief systems of the *Rules for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for liquefied Gases), or Ch 8, 2 Cargo tank venting, of the *Rules for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals), where applicable.

Ventilators, Air Pipes and Discharges

Part 3, Chapter 12

Section 2

2.2 Coamings

2.2.1 The scantlings and height of ventilator coamings exposed to the weather are to be not less than required by Table 12.2.1 Ventilator coaming requirements but the thickness need not exceed that of the adjacent deck or bulkhead plating. In particularly exposed positions, the height of coamings and scantlings may be required to be increased.

Table 12.2.1: Ventilator coaming requirements

Feature	Requirements
Height (measured above sheathing if fitted)	(1) $z_c = 900$ mm at Position 1 (see Pt 3, Ch 1, 6.5 Position 1 and Position 2)
	$z_c = 760$ mm at Position 2 (see Pt 3, Ch 1, 6.5 Position 1 and Position 2)
Thickness	(2) $t_c = 5,5 + 0,01 \delta_v$ mm where $7,5 \text{ mm} \leq t_c \leq 10,0 \text{ mm}$
Support	(3) If $z_c > 900$ mm the coaming is to be specially supported
Symbols	
t_c = thickness of coaming, in mm	
z_c = height of coaming, in mm	
δ_v = internal diameter of coaming, in mm	
NOTE	
Where the height of the ventilator exceeds that given in Item (1), the thickness given by (2) may be generally reduced, above that height, to a minimum of 6,5 mm. The ventilator is to be adequately stayed.	

2.2.2 The height of ventilator coamings may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention Load Lines, 1966*.

2.2.3 For gooseneck ventilators, the coaming height is to be measured to the underside of the bend, this being the lowest point through which water on deck could pass freely to spaces below.

2.2.4 Where wall vents are fitted with an internal baffle which rises above the lower edge of the exterior opening, the coaming height is measured to the top of the baffle.

2.2.5 Where permitted by the National Authority, ventilator coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm in Position 1 and 300 mm in Position 2.

2.3 Closing appliances

2.3.1 All ventilator openings are to be provided with efficient weathertight closing appliances of steel or other equivalent material unless:

- the height of the coaming is greater than 4,5 m where Table 12.2.1 Ventilator coaming requirements requires a minimum height of 900 mm; or
- the height of the coaming is greater than 2,3 m where Table 12.2.1 Ventilator coaming requirements requires a minimum height of 760 mm.

2.3.2 In ships where the load line length, L_L (see Pt 3, Ch 1, 6.1 Principal particulars), is not more than 100 m, the closing appliances are to be permanently attached to the ventilator coaming. Where not so provided in other ships, they are to be conveniently stowed near the ventilator to which they are to be fitted.

2.3.3 Where, in ferries, ventilators are proposed to be led overboard in an enclosed 'tween deck, the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4,5 m above the main vehicle deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.

2.3.4 On offshore supply ships, to ensure satisfactory operation in all weather conditions, machinery space ventilation inlets and outlets are to be located in such positions that closing appliances will not be necessary.

2.3.5 Mushroom ventilators closed by a head revolving on a centre spindle (screw down head) are acceptable in Position 2, and also in sheltered positions in Position 1, excluding those described in Pt 3, Ch 12, 2.1 General, but the diameter is not to exceed 300 mm if situated within the forward 0,25L \perp .

2.3.6 Mushroom ventilators with a fixed head and closed by a screw down plate (screw down cover) may be accepted in exposed positions within the forward 0,25L \perp , excluding those described in Pt 3, Ch 12, 2.3 Closing appliances, up to a diameter of 750 mm.

2.3.7 Wall ventilators (jalousies) may be accepted provided they are capable of being closed weathertight by hinged steel gasketed covers secured by bolts or toggles.

2.3.8 A ventilator head not forming part of the closing arrangements is to be not less than 6,5 mm thick.

2.3.9 In order to limit the fire growth potential in every space of the ship, the main inlets and outlets of all ventilation systems shall be capable of being closed from outside the spaces being ventilated. The means of closing shall be easily accessible as well as prominently and permanently marked and shall indicate whether the inlet or outlet is open or closed. Battery room ventilators are only to be fitted with a means of closing, whenever:

- (a) the battery room does not open directly on to an exposed deck; or
- (b) the ventilation opening for the battery room is required to be fitted with a closing device according to the Load Line Convention; or
- (c) the battery room is fitted with a fixed gas fire extinguishing system.

Where a battery room ventilator is fitted with a closing device see Pt 6, Ch 2, 12.5 Ventilation.

2.4 Machinery spaces

2.4.1 In general, ventilators necessary to continuously supply the machinery space are to have coamings of sufficient height to comply with Pt 3, Ch 12, 2.3 Closing appliances without having to fit weathertight closing appliances. Ventilators to emergency generator rooms are to be so positioned that closing appliances are not required.

2.4.2 Where due to ship size and arrangement this is not practicable, lesser heights for machinery space ventilator coamings fitted with weathertight closing appliances may be permitted by the administration in combination with other suitable arrangements to ensure uninterrupted, adequate supply of ventilation to these spaces.

■ Section 3 Air and sounding pipes

3.1 General

3.1.1 Air pipes located on the exposed deck over the forward 0,25L of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0,1L or 22 m above the summer load waterline, whichever is the lesser, are to comply with the requirements of Section 5. All other air and sounding pipes are to comply with the following requirements in addition to the applicable requirements of Pt 5, Ch 13, 12 Air, overflow and sounding pipes and Pt 5, Ch 15, 3 Piping systems for bilge, ballast, fuel oil, etc..

3.1.2 Striking plates of suitable thickness, or their equivalent, are to be fitted under all sounding pipes.

3.1.3 On offshore supply ships, air pipes are to be situated clear of the cargo containment areas.

3.2 Height of air pipes

3.2.1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below, is normally to be not less than:

- 760 mm on the freeboard deck;
- 450 mm on the superstructure deck;

these heights being measured above deck sheathing, where fitted.

3.2.2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances of an approved automatic type will generally be required.

3.2.3 The height of air pipes may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the *International Convention on Load Lines, 1966*. An increase in height may also be required or recommended by individual Administrations when air pipes to fuel oil and settling tanks are situated in positions where sea water could be temporarily entrapped, e.g. in recesses in the sides and ends of superstructures or deckhouses, between hatch ends, behind high sections of bulwark, etc. This may entail an increase in tank scantlings, see also Pt 3, Ch 3 Structural Design.

3.2.4 Air pipes are generally to be led to an exposed deck. For alternative arrangements in an enclosed space on a main vehicle deck, see Pt 4, Ch 2, 9 Subdivision structure on vehicle deck.

3.2.5 Where air pipes are led through the side of superstructures, the opening is to be at least 2,3 m above the summer load waterline.

3.2.6 The minimum wall thickness of air pipes in positions indicated in Pt 3, Ch 12, 3.2 Height of air pipes is to be:

- 6,0 mm for pipes of 80 mm external diameter or smaller;
- 8,5 mm for pipes of 165 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation.

3.2.7 Where permitted by the National Authority, air pipe coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm on the freeboard deck and 300 mm on a superstructure deck.

3.3 Closing appliances

3.3.1 All openings of air and sounding pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water, see also Pt 3, Ch 12, 3.2 Height of air pipes.

3.3.2 Closing appliances are to be of an approved automatic type.

3.3.3 Pressure/vacuum valves as required by Pt 5, Ch 15, 5 Cargo tank venting, purging and gas-freeing may be accepted as closing appliances for cargo tanks.

■ **Section 4** **Scuppers and sanitary discharges**

4.1 General

4.1.1 Scuppers sufficient in number and size to provide effective drainage are to be fitted in all decks.

4.1.2 Scuppers draining weather decks and spaces within superstructures or deckhouses not fitted with efficient weathertight doors are to be led overboard.

4.1.3 Where the freeboard is such that the freeboard deck edge is immersed when the ship heels 5° or less, scuppers and discharges which drain spaces below the freeboard deck, or spaces within intact superstructures or deckhouses on the freeboard deck fitted with efficient weathertight doors, are to be led to the bilges in the case of scuppers or to suitable sanitary tanks in the case of sanitary discharges. Where the freeboard is such that the freeboard deck edge is immersed when the ship heels greater than 5° then they may be led overboard and fitted with means of preventing water from passing inboard in accordance with Pt 3, Ch 12, 4.2 Closing appliances.

4.1.4 In ships where an approved fixed pressure water spray fire-extinguishing system is fitted in vehicle or cargo spaces, deck scuppers of not less than 150 mm diameter are to be provided port and starboard, spaced about 9,0 m apart. The scupper area will require to be increased if the design capacity of the drencher system exceeds the Rule required capacity by 10 per cent or more. After installation, the two adjacent sections with the greatest aggregate drencher capacity are to be tested in operation to ensure that there is no build up of water on the deck, see also Pt 4, Ch 2, 11.2 Openings in main vehicle deck. The mouth of the scupper is to be protected by bars.

4.1.5 Where a sewage system is fitted, the shipside valves on the discharge pipe from the effluent tank(s) and the by-pass system are to comply with Pt 3, Ch 12, 4.2 Closing appliances.

4.1.6 The minimum wall thickness of pipes not indicated in Pt 3, Ch 12, 4.2 Closing appliances is to be:

- 4,5 mm for pipes of 155 mm external diameter or smaller.
- 6,0 mm for pipes of 230 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation.

4.1.7 For the use of non-metallic pipe, see Pt 5, Ch 12, 5 Plastics pipes.

4.1.8 Scuppers and discharge pipes should not normally pass through fuel oil or cargo oil tanks. Where scuppers and discharge pipes pass, unavoidably, through fuel oil or cargo oil tanks, and are led through the shell within the tanks, the thickness of the piping should be at least the same thickness as Rule shell plating in way, derived from the appropriate Chapters, but need not exceed 19 mm.

4.1.9 Piping within tanks is to be tested in accordance with Pt 3, Ch 1, 8 Inspection and workmanship.

4.1.10 All piping is to be adequately supported.

4.1.11 See also the *Rules for Ships for Liquefied Gases* or the *Rules for Ships for Liquid Chemicals*, where applicable.

4.1.12 For additional requirements for scuppers and sanitary discharges on dredging and reclamation craft, see Pt 4, Ch 12, 15 Spoil space weirs and overflows.

4.2 Closing appliances

4.2.1 In general, each separate overboard discharge is to be fitted with a screw-down non-return valve capable of being operated from a position always accessible and above the freeboard deck. An indicator is to be fitted at the control position showing whether the valve is open or closed. A machinery space, whether manned or unattended (i.e. with **UMS** notation), is considered accessible. Cargo holds or spaces with access only by hatches or bolted manholes are not considered accessible.

4.2.2 Where a drencher fire-extinguishing system is provided in an enclosed vehicle space of a ferry, the scupper controls are to be operated from a position above the bulkhead deck, and outside the vehicle space protected by the drencher system, and are to be protected from mechanical damage.

4.2.3 Where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds $0,01L_L$ the discharge may be fitted with two automatic non-return valves without positive means of closing, instead of the screw-down non-return valve, provided that the inboard valve is always accessible for examination under service conditions.

4.2.4 Where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds $0,02L_L$, a single automatic non-return valve without positive means of closing may be fitted, see Figure 12.4.1 Diagrammatic arrangement of discharge valves.

4.2.5 The requirements for non-return valves are applicable only to those discharges which remain open during the normal operation of the ship. For discharges which are closed at sea, such as gravity drains from topside ballast tanks, a single screw down valve operated from the freeboard deck is considered to provide sufficient protection.

4.2.6 Scuppers and discharge pipes originating at any level which penetrate the shell either more than 450 mm below the freeboard deck or less than 600 mm above the summer load waterline, are to be fitted with an automatic non-return valve at the shell. This valve, unless required by Pt 3, Ch 12, 4.1 General, may be omitted provided the piping has a minimum wall thickness of:

- 7,0 mm for pipes of 80 mm external diameter or smaller;
- 10,0 mm for pipes of 180 mm external diameter;
- 12,5 mm for pipes of 220 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation. Unless required by Pt 3, Ch 12, 4.1 General, the maximum thickness need not exceed 12,5 mm.

4.2.7 The outboard valve is to be mounted directly on the shell and secured in accordance with Pt 5, Ch 13, 2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges). If this is impracticable, a short distance piece of rigid construction may be introduced between the valve and the shell. Valves should not be fitted in cargo tanks.

4.2.8 If a valve is required by Pt 3, Ch 12, 4.1 General, this valve should preferably be fitted as close as possible to the point of entry of the pipe into the tank. If fitted below the freeboard deck, the valve is to be capable of being controlled from an easily accessible position above the freeboard deck. Local control is also to be arranged, unless the valve is inaccessible. An indicator is to be fitted at the control position showing whether the valve is open or closed.

4.2.9 In a ship to which timber freeboards are assigned, the summer load waterline is to be regarded as that corresponding to the timber summer freeboard.

4.2.10 For ship side valves and fittings (other than those on scuppers and sanitary discharges), see Pt 5, Ch 13, 2 Construction and installation and Pt 6, Ch 1, 2 Essential features for control, alarm and safety systems.

4.3 Rubbish chutes, offal and similar discharges

4.3.1 Rubbish chutes, offal and similar discharges should be constructed of mild steel piping or plating of shell thickness. Other materials will be specially considered. Openings are to be kept clear of the sheerstrake and areas of high stress concentration.

4.3.2 Rubbish chute hoppers are to be provided with a hinged weathertight cover at the inboard end with an interlock so that the discharge flap and hopper cover cannot be open at the same time. The hopper cover is to be secured closed when not in use, and a suitable notice displayed at the control position.

4.3.3 Where the inboard end of the hopper is less than $0,01L_L$ above the summer load waterline, a suitable valve with positive means for closing is to be provided in addition to the cover and flap in an easily accessible position above the deepest seasonal waterline. The valve is to be controlled from a position adjacent to the hopper and provided with an open/shut indicator. The valve is to be kept closed when not in use, and a suitable notice displayed at the valve operating position.

4.3.4 Where damage stability requirements apply and the inboard end of the chute is below the equilibrium waterlines, or in passenger ships, where the inboard end of a rubbish chute is below the margin line; see Pt 3, Ch 11, 8.2 General.

4.3.5 In trawlers or fish factory ships, offal discharges in the fish working spaces are to be provided with either a non-return flap, preferably fitted at the shell which can be positively secured weathertight, or a separate positively controlled valve kept closed when not in use. A suitable notice is to be displayed at the flap or valve operating position.

4.4 Materials for valves, fittings and pipes

4.4.1 All shell fittings and valves required by Pt 3, Ch 12, 4.2 Closing appliances are to be of steel, bronze or other approved ductile material; ordinary cast iron or similar material is not acceptable. Materials are to satisfy the requirements of the Rules for the Manufacture, Testing and Certification of Materials.

4.4.2 All these items, if made of steel or other approved material with low corrosion resistance, are to be suitably protected against wastage.

4.4.3 The lengths of pipe attached to the shell fittings, elbow pieces or valves are to be of galvanised steel or other equivalent approved material.

■ *Section 5*

Air pipes, ventilator pipes and their securing devices located on the exposed fore deck

5.1 General

5.1.1 For the application of the following requirements relating to ventilators, see Pt 3, Ch 12, 2.1 General. For the application of the following requirements relating to air pipes, see Pt 3, Ch 12, 3.1 General. Air pipes complying with the following requirements are also to comply with the applicable requirements of Pt 5, Ch 13, 12 Air, overflow and sounding pipes and Pt 5, Ch 15, 3.5 Air and sounding pipes.

5.1.2 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.

5.1.3 Ventilators from deep tanks and tunnels passing through 'tween decks are to have scantlings suitable for withstanding the pressures to which they may be subjected, and are to be made watertight.

5.1.4 For height and location of cargo tank vent outlets, see Pt 5, Ch 15, 5 Cargo tank venting, purging and gas-freeing and see also Ch 8, 2 Pressure relief systems and Ch 8, 2 Pressure relief systems of the Rules for Ships for Liquefied Gases, or Ch 8, 2 Cargo tank venting, of the Rules for Ships for Liquid Chemicals, where applicable.

5.1.5 On offshore supply ships, air pipes are to be situated clear of the cargo containment areas.

5.2 Loading

5.2.1 The design pressure acting on air pipes, ventilator pipes and their closing devices is to be taken as not less than:

$$p = 0,5 \rho V^2 C_d C_s C_p \text{ kN/m}^2$$

where

ρ = density of sea water (1,025 t/m³)

V = velocity of water over the fore deck

= 13,5 m/sec for $d \leq 0,5d_1$

= $13,5 \sqrt{2 \left(1 - \frac{d}{d_1}\right)}$ for $d > 0,5d_1$

d = distance from summer load waterline to exposed deck

d_1 = 0,1L but need not be taken as greater than 22 m

C_d = shape coefficient (0,5 for pipes, 1,3 for air pipe or ventilator heads in general and 0,8 for an air pipe or ventilator head of cylindrical form with its axis in the vertical direction)

C_s = slamming coefficient (3,2)

C_p = protection coefficient (0,7 for pipes and ventilator heads located immediately behind a breakwater or forecastle and 1,0 elsewhere and immediately behind a bulwark).

5.2.2 Forces acting in the horizontal direction on the pipe and its closing device are to be not less than those calculated from Pt 3, Ch 12, 5.2 Loading using the largest projected area of each component.

5.3 Strength requirements

5.3.1 Bending moments and stresses in air and ventilator pipes are to be calculated at critical positions:

- at penetration pieces;
- at weld or flange connections; and
- at toes of supporting brackets.

5.3.2 Bending stresses in the net section are not to exceed $0,8\sigma_y$, where σ_y is the specified minimum yield stress or 0,2 per cent proof stress of the steel at room temperature. Irrespective of corrosion protection, a corrosion addition to the net section of 2,0 mm is then to be applied.

5.3.3 For standard air pipes of 760 mm coaming height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in Table 12.5.1 Air pipe thickness and bracket standards. Where brackets are required, three or more radial brackets are to be fitted. Brackets are to be of gross thickness 8 mm or more, of minimum length 100 mm, and height according to Table 12.5.1 Air pipe thickness and bracket standards but need not extend over the joint flange for the head. Bracket toes at the deck are to be suitably supported.

Table 12.5.1: Air pipe thickness and bracket standards

Nominal pipe diameter, in mm	Minimum fitted gross thickness, in mm	Maximum projected area of head, in cm ²	Height ⁽¹⁾ of brackets, in mm
65A	6,0	-	480
80A	6,3	-	460
100A	7,0	-	380
125A	7,8	-	300
150A	8,5	-	300
175A	8,5	-	300
200A	8,5 ⁽²⁾	1900	300 ⁽²⁾
250A	8,5 ⁽²⁾	2500	300 ⁽²⁾
300A	8,5 ⁽²⁾	3200	300 ⁽²⁾
350A	8,5 ⁽²⁾	3800	300 ⁽²⁾
400A	8,5 ⁽²⁾	4500	300 ⁽²⁾
(1) Brackets (see Pt 3, Ch 12, 5.3 Strength requirements) need not extend over the joint flange for the head.			
(2) Brackets are required where the as fitted (gross) thickness is less than 10,5mm, or where the tabulated projected head area is exceeded.			
Note For other pipe heights, the relevant requirements of 5.3 are to be applied.			

5.3.4 For other configurations, loads according to Pt 3, Ch 12, 5.2 Loading are to be applied, and means of support determined in order to comply with the requirements of Pt 3, Ch 12, 5.3 Strength requirements and Pt 3, Ch 12, 5.3 Strength requirements. Brackets, where fitted, are to be of suitable thickness and length according to their height. Pipe thickness is not to be taken less than as indicated in Pt 5, Ch 12 Piping Design Requirements.

Table 12.5.2: 900 mm Ventilator pipe thickness and bracket standards

Nominal pipe diameter, in mm	Minimum fitted gross thickness, in mm	Maximum projected area of head, in cm ²	Height of brackets, in mm
80A	6,3	-	460
100A	7,0	-	380
150A	8,5	-	300
200A	8,5	550	-
250A	8,5	880	-
300A	8,5	1200	-
350A	8,5	2000	-
400A	8,5	2700	-
450A	8,5	3300	-

500A	8,5	4000	-
Note For ventilator heights other than 900 mm, the relevant requirements of 5.3 are to be applied.			

5.3.5 For standard ventilators of 900 mm coaming height closed by heads of not more than the tabulated projected area, pipe thicknesses and bracket heights are specified in Table 12.5.2 900 mm Ventilator pipe thickness and bracket standards. Brackets, where required, are to be as specified in Pt 3, Ch 12, 5.3 Strength requirements.

5.3.6 For ventilators of coaming height greater than 900 mm, the coaming support will be specially considered. Pipe thickness is not to be taken less than as indicated in Pt 5, Ch 12 Piping Design Requirements.

5.3.7 All component parts and connections of the air pipe or ventilator are to be capable of withstanding the loads defined in Pt 3, Ch 12, 5.2 Loading.

5.4 Ventilator coamings

5.4.1 The height of ventilator coamings is to be not less than 900 mm, this height being measured above deck sheathing, where fitted. In particularly exposed positions, the heights of coamings and scantlings may be required to be increased.

5.4.2 The height of ventilator coamings may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the International Convention on Load Lines, 1966 .

5.4.3 For gooseneck ventilators, the coaming height is to be measured to the underside of the bend, this being the lowest point through which water on deck could pass freely to spaces below.

5.4.4 Where wall vents are fitted with an internal baffle which rises above the lower edge of the exterior opening, the coaming height is measured to the top of the baffle.

5.4.5 Where permitted by the National Authority, ventilator coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm.

5.5 Height of air pipes

5.5.1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below is normally to be not less than 760 mm, this height being measured above deck sheathing, where fitted.

5.5.2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances of an approved automatic type will generally be required.

5.5.3 The height of air pipes may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the International Convention on Load Lines, 1966 . An increase in height may also be required or recommended by individual Administrations when air pipes to fuel oil and settling tanks are situated in positions where sea-water could be temporarily entrapped, e.g. in recesses in the sides and ends of superstructures or deckhouses, between hatch ends, behind high sections of bulwark, etc. This may entail an increase in tank scantlings, see also Pt 3, Ch 3 Structural Design.

5.5.4 Air pipes are generally to be led to an exposed deck. For alternative arrangements in an enclosed space on a main vehicle deck, see Pt 4, Ch 2, 9 Subdivision structure on vehicle deck.

5.5.5 Where air pipes are led through the side of superstructures, the opening is to be at least 2,3 m above the summer load waterline.

5.5.6 Where permitted by the National Authority, air pipe coaming heights may be reduced on ships engaged on protected or extended protected water service. Coaming heights are to be as high as practicable, with a minimum height of 450 mm.

5.6 Closing appliances for ventilators

5.6.1 All ventilator openings are to be provided with efficient weathertight closing appliances unless the height of the coaming is greater than 4,5 m.

5.6.2 In ships where the load line length, L_L (see Pt 3, Ch 1, 6.1 Principal particulars), is not more than 100 m, the closing appliances are to be permanently attached to the ventilator coaming. Where not so provided in other ships, they are to be conveniently stowed near the ventilator to which they are to be fitted.

5.6.3 Where, in ferries, ventilators are proposed to be led overboard in an enclosed 'tween deck, the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4,5 m above the main vehicle deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.

5.6.4 On offshore supply ships, to ensure satisfactory operation in all weather conditions, machinery space ventilation inlets and outlets are to be located in such positions that closing appliances will not be necessary.

5.6.5 Rotating type mushroom ventilator heads are unsuitable for application on the exposed fore deck.

5.6.6 Wall ventilators (jalousies) may be accepted provided they are capable of being closed weathertight by hinged steel gasketed covers secured by bolts or toggles.

5.6.7 A ventilator head not forming part of the closing arrangements is to be not less than 6,5 mm thick.

5.7 Closing appliances for air pipes

5.7.1 All openings of air pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water, see *also* Pt 3, Ch 12, 5.5 Height of air pipes.

5.7.2 Closing appliances are to be of an approved automatic type where, with the ship at its summer load waterline, the openings are immersed at an angle of heel of 40° or, the angle of down flooding if this is less than 40°. *see also* Pt 3, Ch 3, 6 Minimum bow heights, reserve buoyancy and extent of forecastle.

5.7.3 Where the closing appliances are not of an automatic type, provision is to be made for relieving vacuum when the tanks are being pumped out.

5.7.4 In a ship to which timber freeboards are assigned, air pipes which will be inaccessible when the deck cargo is carried are to be provided with approved automatic closing appliances.

5.7.5 Pressure/vacuum valves as required by Pt 5, Ch 15, 5 Cargo tank venting, purging and gas-freeing may be accepted as closing appliances for cargo tanks.

Section

- 1 **General**
- 2 **Rudders**

- 4 **Steering gear and allied systems**
- 5 **Bow and stern thrust unit structure**
- 6 **Stabiliser structure**
- 7 **Equipment**
- 8 **Windlass design and testing**
- 9 **Mooring of ships at single point moorings**
- 10 **Emergency towing arrangements**

■ *Section 1* **General**

1.1 Application

1.1.1 This Chapter applies to all the ship types detailed in Pt 4 Ship Structures (Ship Types), and requirements are given for rudders, nozzles, steering gear, bow and stern thrust unit structure, stabiliser structure, anchoring and mooring equipment, and emergency towing arrangements.

1.1.2 The requirements in this Chapter are not applicable to Double Hull Oil Tankers or Bulk Carriers with a **CSR** notation (see Pt 1, Ch 2, 2.3 Class notations (hull)) with the exception of the following:

- For Double Hull Tankers; Sections Pt 3, Ch 13, 2 Rudders to Pt 3, Ch 13, 6 Stabiliser structure are to be complied with as applicable.
- For Bulk Carriers; Sections Pt 3, Ch 13, 3 Fixed and steering nozzles to Pt 3, Ch 13, 6 Stabiliser structure and Section Pt 3, Ch 13, 10 Emergency towing arrangements are to be complied with as applicable.

1.2 General symbols

1.2.1 The following symbols and definitions are applicable to this Chapter, unless otherwise stated:

L , B and C_b as defined in Pt 3, Ch 1, 6.1 Principal particulars

σ_0 = minimum yield stress or 0,5 per cent proof stress of the material, in N/mm²(kgf/mm²)

k = higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel.

1.3 Navigation in ice

1.3.1 Where an ice class notation is included in the class of a ship, additional requirements are applicable as detailed in Pt 8 Rules for Ice and Cold Operations.

1.4 Podded propulsion

1.4.1 Where podded propulsion is included in the class of a ship, additional requirements as detailed in Pt 5, Ch 9 Podded Propulsion Units are to be complied with, as applicable.

1.5 Materials

1.5.1 The requirements for materials are contained in the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.5.2 Stern frames, rudder horns, shaft brackets, rudder stocks, pintles, coupling bolts, keys, and other rudder members are to be made of rolled, forged or cast carbon-manganese steel in accordance with Ch 3 Rolled Steel Plates, Strip, Sections and Bars, Ch 4 Steel Castings and Ch 5 Steel Forgings of the Rules for Materials. Cast steel stern frames, rudder horns, shaft brackets and sole pieces are to be manufactured from special grade material as specified in Ch 4, 2 Castings for ship and other structural applications of the Rules for Materials.

■ Section 2 Rudders

2.1 Design considerations

2.1.1 Effective means are to be provided for supporting the weight of the rudder without excessive bearing pressure, e.g. by a rudder carrier attached to the upper part of the rudder stock. The hull structure in way of the rudder carrier is to be suitably strengthened.

2.1.2 Suitable arrangements are to be provided to prevent the rudder from lifting.

2.1.3 In rudder trunks which are open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline, to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If the top of the rudder trunk is below the deepest waterline, two separate stuffing boxes are to be provided. Rudder trunk boundaries, where exposed to the sea, are to have a corrosion protection coating applied in accordance with the manufacturer's instructions.

2.2 Lateral force on rudder blade

2.2.1 The lateral rudder force at the centre of pressure is to be determined for both ahead and astern conditions from the following formula:

$$P_L = 132 C_1 C_2 C_3 C_{TH} A_R V^2 N$$

where

A_R = rudder blade area, in m²

A_T = sum of rudder blade area A_R and area of rudder post or rudder horn, if any, within the rudder mean height h_R , in m²

C_1 = factor depending on the aspect ratio λ of the rudder area
 $= \frac{\lambda + 2}{3}$

C_2 = rudder profile coefficient, see Table 13.2.1 Rudder profile coefficient, C_2

C_3 = 1,0 in general

= 0,8 for rudders outside the propeller jet

= 1,15 for rudders behind a fixed propeller nozzle

C_{TH} = thrust coefficient, is generally to be taken as 1

P_L = lateral force acting on the rudder, in N, is to be calculated for both ahead and astern conditions. The greater of these two values are to be used throughout Section 2

V = maximum service speed, in knots, which the ship is designed to maintain, at the summer load waterline.
 Maximum ahead service speed means the maximum service speed which the ship is designed to maintain, at the summer load waterline at maximum propeller RPM and corresponding engine MCR. When the speed is

where

less than 10 knots, V is to be replaced by the expression $V_{\min} = \frac{V + 20}{3}$. For the astern condition the actual astern speed, in knots, or $0,5V$, whichever is the greater is to be used (for bow rudders $V = V_A$)

$$\lambda = \frac{h_R^2}{A_T}, \text{ but not to be taken greater than } 2$$

h_R = mean height, in metres, of the rudder area, see Figure 13.2.2 Rudder co-ordinate system.

2.3 Rudder torque calculation for rudders without cut-outs

2.3.1 The rudder torque, M_T , is to be determined for both the ahead and astern conditions according to the following formula:

$$M_T = P_L x_p \text{ Nm}$$

where

P_L = lateral force acting on rudder, as calculated in Pt 3, Ch 13, 2.2 Lateral force on rudder blade

x_p = $b_R (\alpha - k)$, in metres, but not less than $0,1b_R$

M_T = the rudder torque, in Nm, to be calculated for both ahead and astern conditions. The greater of these two values are to be used throughout Pt 3, Ch 13, 2 Rudders

b_R = mean breadth of rudder, in metres, see Figure 13.2.2 Rudder co-ordinate system

α = as given in Table 13.2.2 Coefficient, α

$$k = \frac{A_f}{A_R}$$

A_f = portion of the rudder blade area, situated in front of the centreline of the rudder stock, in m^2 , see Figure 13.2.2 Rudder co-ordinate system.

2.4 Rudder torque calculation for rudders with cut-outs

2.4.1 The rudder torque, M_T , is to be determined for both the ahead and astern conditions as follows. The rudder area, A_R , used in the derivation of the rudder torque may be divided into two rectangular or trapezoidal parts with areas A_1 and A_2 , so that $A_R = A_1 + A_2$, see Figure 13.2.3 Rudder areas.

$$M_T = M_1 + M_2 \text{ Nm}$$

where

$$M_1 = P_{L1} x_{p1} \text{ Nm}$$

$$M_2 = P_{L2} x_{p2} \text{ Nm}$$

M_T = the rudder torque, in Nm, to be calculated for both ahead and astern conditions. The greater of these two values are to be used throughout Pt 3, Ch 13, 2 Rudders

P_L = lateral force acting on the rudder, in N, as calculated in Pt 3, Ch 13, 2.2 Lateral force on rudder blade

$$P_{L1} = \frac{A_1}{A_R} P_L \text{ N}$$

$$P_{L2} = \frac{A_2}{A_R} P_L \text{ N}$$

$x_{p1} = b_{R1} (\alpha - k_1)$, in metres

$x_{p2} = b_{R2} (\alpha - k_2)$, in metres

where

$$A_1 = A_{1a} + A_{1f}, \text{ in m}^2, \text{ see Figure 13.2.3 Rudder areas}$$

$$A_2 = A_{2a} + A_{2f}, \text{ in m}^2, \text{ see Figure 13.2.3 Rudder areas}$$

$$b_{R1} = \text{mean breadth, in metres, of partial area } A_1$$

$$b_{R2} = \text{mean breadth, in metres, of partial area } A_2$$

$$\alpha = \text{as given in Table 13.2.2 Coefficient, } \alpha$$

$$k_1 = \frac{A_{1f}}{A_1}$$

$$k_2 = \frac{A_{2f}}{A_2}$$

For ahead condition M_T is not to be taken less than

$$M_{T, \min} = 0,1 P_L \frac{A_1 b_{R1} + A_2 b_{R2}}{A_R} \text{ Nm}$$

Table 13.2.1: Rudder profile coefficient, c_2

Profile type (see Figure 13.2.1 Rudder profiles)	Ahead	Astern
NACA-00	1,1	0,8
Hollow profiles	1,35	0,9
Flat side profiles	1,1	0,9
High lift profile	1,7	to be specially considered
Note For rudder profiles not defined above, the value of c_2 may be determined on the basis of experimental results. These results are to be submitted for consideration.		

Table 13.2.2: Coefficient, α

Condition	Behind fixed structure, (see Note)	Not behind a fixed structure
Ahead	0,25	0,33
Astern	0,55	0,66
Note For rudder parts behind a fixed structure such as a rudder horn.		

Figure 13.2.1: Rudder profiles

Figure 13.2.2: Rudder co-ordinate system

Figure 13.2.3: Rudder areas

2.5 Rudder stock and bearings

2.5.1 The scantlings of the stock are to be not less than required by Table 13.2.3 Rudder stock diameter.

2.5.2 For the purpose of this Section, the material factor, k_o , applicable to rudder stocks, pintles, coupling flanges, bolts, keys, etc. is defined in Table 13.2.4 Material factor k_o . For higher tensile steel rudder stocks, welding, including cladding, is not generally permitted.

2.5.3 The rudder stock diameter is to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 13.2.5 Permissible stresses.

2.5.4 Where reductions in rudder stock diameter due to the application of steels with yield stresses exceeding 235 N/mm² are requested, evaluation of the rudder stock deformations may be required. Large deformations are to be avoided in order to avoid excessive edge pressures in way of bearings.

2.5.5 For spade rudders the stock diameter corrected for higher tensile steel is to be greater than 90 per cent of the uncorrected stock diameter unless direct calculations are submitted showing that the slope of the stock at the lowest main bearing does not exceed 0,0035 when the rudder blade is loaded by a lateral force of P_L , acting at the centre of pressure.

2.5.6 For rudders having an increased diameter of the rudder stock in way of the rudder, the increased diameter is to be maintained to a point as far as practicable above the top of the lowest bearing. The diameter may then be tapered to the diameter required in way of the tiller. The length of the taper is to be at least three times the reduction in diameter. Particular care is to be taken to avoid the formation of a notch at the upper end of the taper, see Figure 13.2.5 Rudder stock taper.

2.5.7 Sudden changes of section or sharp corners in way of the rudder coupling, jumping collars and shoulders for rudder carriers, are to be avoided. Jumping collars are not to be welded to the rudder stock. Keyways in the rudder stock are to have rounded ends and the corners at the base of the keyway are to be radiused. For stainless steel liners formed by weld deposit, see Pt 3, Ch 13, 2.9 Pintles.

2.5.8 Bearings are to comply with the requirements of Table 13.2.6 Bearing requirements for rudder stock and pintles. The fitting of bearings is to be carried out in accordance with the manufacturer's recommendations to ensure that they remain secure under all foreseeable operating conditions.

2.5.9 On dredging and reclamation craft classed **A1 protected water service**, the rudder stock diameter may be 84 per cent of that required for ships classed **100A1**.

Table 13.2.3: Rudder stock diameter

Item	Requirement
(1) Basic stock diameter, δ_S , at and below lowest bearing	$\delta_S = \delta_t \sqrt[6]{1 + \frac{4}{3} \left(\frac{M_B}{M_T} \right)^2}$ mm
(2) Diameter, δ_t , in way of tiller	$\delta_t = 4,2 \sqrt[3]{M_T k_o}$ mm
Symbols	
<p>M_T = Total rudder torque, in Nm, as calculated in Pt 3, Ch 13, 2.3 Rudder torque calculation for rudders without cut-outs or Pt 3, Ch 13, 2.4 Rudder torque calculation for rudders with cut-outs</p> <p>M_B = bending moment, in Nm, at section considered. If direct calculations of bending moment distribution are not carried out, then M_B at the lowest main bearing or rudder coupling may be taken as:</p> <p>$M_B = \frac{h_R}{10 C_r} P_L$ for rudders with heel support</p> <p>$M_B = b P_L$ for spade rudders</p> <p>$M_B = \frac{h_R}{10(1 + C_r)} P_L$ for semi – spade rudders</p> <p>$C_r = \frac{b_R^2}{A_R}$</p> <p>b = distance, in metres, from centroid of rudder area to the centre of lowest bearing, see Figure 13.2.4 Centroid of rudder area for common rudder types</p> <p>b_R = mean breadth of rudder, in metres, see Figure 13.2.2 Rudder co-ordinate system</p> <p>h_R = mean depth of rudder, in metres, see Figure 13.2.2 Rudder co-ordinate system</p> <p>P_L = rudder force, as defined in Pt 3, Ch 13, 2.2 Lateral force on rudder blade</p> <p>k_o = as defined in Table 13.2.4 Material factor k_o</p>	

Table 13.2.4: Material factor k_o

σ_o	k_o
For $\sigma_o > 235$ (24)	$\left(\frac{235}{\sigma_o} \right)^{0,75} \left(\frac{24}{\sigma_o} \right)^{0,75}$
For $\sigma_o \leq 235$ (24)	$\left(\frac{235}{\sigma_o} \right) \left(\frac{24}{\sigma_o} \right)$
Symbols	

σ_o = minimum yield stress in N/mm² (kgf/mm²)

k_o = higher tensile steel correction factor

Note σ_o is to be taken not greater than 70 per cent of the ultimate tensile strength or 450 N/mm² (45,9 kgf/mm²), whichever is the lesser. σ_o is not to be less than 200 N/mm², see Ch 5, 2.4 Mechanical tests of the Rules for Materials.

Table 13.2.5: Permissible stresses

Mode	Permissible stress, N/mm ² (kgf/mm ²)	
(1) Torsional shear stress, τ_T	$68/k_o$	$(6,9/k_o)$
(2) Equivalent stress, σ_e	$118/k_o$	$(12/k_o)$
Symbols and parameters		
<p>σ_T = equivalent stress</p> $= \sqrt{\frac{\sigma_b^2}{3} + \tau^2} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$ <p>σ_b = bending stress</p> $= 10,2 \frac{M_B}{\delta_s^3} 10^3 \text{ N/mm}^2 \left(1,04 \frac{M_B}{\delta_s^3} 10^3 \text{ kgf/mm}^2 \right)$ <p>τ_T = torsional shear stress</p> $= 5,1 \frac{M_T}{\delta_s^3} 10^3 \text{ N/mm}^2 \left(0,52 \frac{M_T}{\delta_s^3} 10^3 \text{ kgf/mm}^2 \right)$ <p>δ_s = actual stock diameter, as calculated in Table 13.2.3 Rudder stock diameter</p> <p>M_B = bending moment, in Nm, at the section considered. If direct calculations of bending moment distribution are not carried out, then M_B at the lowest main bearing or rudder coupling may be taken as given in Table 13.2.3 Rudder stock diameter</p> <p>M_T = total rudder torque, in Nm, as calculated in Pt 3, Ch 3, 2.2 Definition of fore end region or Pt 3, Ch 3, 2.3 Definition of aft end region</p> <p>k_o = as defined in Table 13.2.4 Material factor k_o</p>		

Table 13.2.6: Bearing requirements for rudder stock and pintles

Item	Requirement	
(1) Bearing surface area	$A_B = \frac{B}{q_a} \text{ mm}^2$	
(2) Bearing length	The length/diameter ratio of the actual bearing surface is not to be greater than 1,2	
(3) Clearance	Bearing material	Minimum clearance (on diameter)
	Metal	$0,001\delta + 1,0$

	Synthetic	See Notes 1, 3, 4 and 5
(4) Rudder stock main bearing wall thickness	Lesser of 0,2δ or 100	See Note 2
(5) Gudgeon thickness in way of pintle (measured outside bush if fitted)	$b_G \geq 0,25\delta$ but need not normally exceed 125 mm	
Symbols		
<p>A_B = bearing surface area, in mm², defined as the projected area (length x diameter) of liner</p> <p>b = distance, in metres, from centre of rudder area to the centre of lowest bearing</p> <p>b_G = thickness of gudgeon material in way of pintle, in mm</p> <p>c = distance, in metres, from centre of lower pintle to the centre of lowest bearing</p> <p>d = distance, in metres, from centre of lowest bearing to the centre of upper bearing. In the case of semi spade rudder with two pintles, d, is to be measured between the centre of upper pintle and centre of upper bearing</p> <p>δ = diameter of stock, δ_S, given in Table 13.2.3 Rudder stock diameter, or pintle, δ_{PL}, given in Table 13.2.12 Pintle requirements, in mm</p> <p>l_B = length of bearing, in mm</p> <p>q_a = maximum surface pressure, see Table 13.2.7 Maximum surface pressure</p> <p>B = bearing force, in N. If direct calculations are not carried out, the bearing force at various positions can be taken as:</p> <p>$B_2 = \left(1 - \frac{b}{c}\right)P_L$, at the lowest main bearing for single pintle rudders and semi-spade rudders, see Figure 13.2.4 Centroid of rudder area for common rudder types (a), (c) and (d). B_2 is not to be less than 0,35P_L</p> <p>$B_2 = P_L + B_3$, at lowest main bearing for spade rudders, see Figure 13.2.4 Centroid of rudder area for common rudder types (b)</p> <p>$B_3 = \left(\frac{M_B}{d}\right)$, at upper bearing for spade rudders, see Figure 13.2.4 Centroid of rudder area for common rudder types(b) . For bearing force at pintles, see Table 13.2.12 Pintle requirements</p>		
<p>Note 1 If non-metallic bearing material is applied, the bearing clearance is to be specially determined considering the material's swelling and thermal expansion properties. This clearance is not to be less than 1,5 mm on bearing diameter unless a smaller clearance is supported by the manufacturer's recommendation and there is documented evidence of satisfactory service history with a reduced clearance.</p> <p>Note 2 Where web stiffening is fitted on the bearing, a reduction in wall thickness will be considered.</p> <p>Note 3 For bearings which are pressure lubricated the clearance must be restricted to enable the pressure to be maintained.</p> <p>Note 4 The value of the proposed minimum clearance is to be indicated on plans submitted for approval.</p> <p>Note 5 Proposals for higher pressures or other materials will be specially considered on the basis of satisfactory test results.</p>		

Table 13.2.7: Maximum surface pressure

Bearing material	q_a (N/mm ²) (see Note 1)
Lignum vitae	2,5
White metal, oil lubricated	4,5
Synthetic material with hardness between 60 and 70 Shore D (see Note 2)	5,5

Steel (see Note 3) and bronze and hotpressed bronze-graphite materials	7,0
<p>Note 1. Proposals for higher pressures will be specially considered on the basis of satisfactory test results.</p> <p>Note 2. Indentation hardness test at 23°C and with 50% moisture, according to a Recognised Standard. Synthetic bearing materials are to be of an approved type.</p> <p>Note 3. Stainless and wear-resistant steel in an approved combination with stock liner.</p>	

**Figure 13.2.4: Centroid of rudder area for common rudder types**

Figure 13.2.5: Rudder stock taper

2.6 Rudder construction – Double plated

2.6.1 The scantlings of a double plated rudder are to be not less than required by Table 13.2.8 Single and double plated rudder construction.

2.6.2 The rudder is to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 13.2.9 Permissible stresses for rudder blade scantlings.

2.6.3 In way of rudder couplings and heel pintles, the plating thickness is to be suitably increased.

2.6.4 On semi-spade/mariner type rudders the following items are to be complied with:

- (a) The main vertical web forming the mainpiece is to be continuous over the full depth of the rudder.
- (b) The thickness of the main vertical web is to be not less than two times the thickness required by Table 13.2.8 Single and double plated rudder construction from the top of the rudder to the lower pintle. The thickness is to be not less than required by Table 13.2.8 Single and double plated rudder construction from the lower pintle to approximately a point midway between the lower pintle and bottom of the rudder. Below this the thickness, t_2 is to be not less than the thickness required by Table 13.2.8 Single and double plated rudder construction. See Figure 13.2.6 Main vertical web thickness.
- (c) Where an additional continuous main vertical web is arranged to form an efficient box mainpiece structure, the thickness of each web is to be not less than that required by Table 13.2.8 Single and double plated rudder construction from the top of the rudder to approximately a point midway between the lower pintle and bottom of the rudder. Below this the thickness, t_2 , is not to be less than that required by Table 13.2.8 Single and double plated rudder construction.
- (d) The internal radius, r , of the cut-out for the rudder pintle is to be as large as practicable. See Figure 13.2.6 Main vertical web thickness.
- (e) To reduce the notch effect at the corners of the cut-out for the lower pintle, an insert plate 1,6 times the Rule thickness of the side plating is to be fitted. The insert plate is to extend aft of the main vertical web and to have well rounded corners.

2.6.5 Adequate hand or access holes are to be arranged in the rudder plating in way of pintles as required, and the rudder plating is to be reinforced locally in way of these openings. Continuity of the modulus of the rudder mainpiece is to be maintained in way of the openings.

2.6.6 Connection of rudder side plating to vertical and horizontal webs, where internal access for welding is not practicable, is to be by means of slot welds on to flat bars on the webs. The slots are to have a minimum length of 75 mm and, in general, a minimum width of twice the side plating thickness. The ends of the slots are to be rounded. The space between the slots is not to exceed 150 mm and welding is to be based on a weld factor of 0,44.

2.6.7 For testing of rudders, see Table 1.9.1 Testing requirements in Chapter 1.

2.6.8 Where the fabricated mainpiece of a spade rudder is connected to the horizontal coupling flange by welding, a full penetration weld is required.

2.7 Rudder construction – Single plated

2.7.1 The scantlings of a single plated rudder are to be not less than required by Table 13.2.8 Single and double plated rudder construction.

2.7.2 Rudder arms are to be efficiently attached to the mainpiece.

Figure 13.2.6: Main vertical web thickness

Table 13.2.8: Single and double plated rudder construction

Type	Item	Requirement
Double plated rudder construction	(1) Rudder side, top and bottom plating	$t = 5,5 s_{\min} s_e \sqrt{\left(T + \frac{P_L 10^{-4}}{A_R} \right) k} + 2,5 \text{ mm}$
	(2) Webs vertical and horizontal	$t_W = 0,7 t$ from (1) but is not to be less than 8 mm
	(3) Nose plate	$t_N = 1,25 t$ from (1) but need not exceed 22 mm
	(4) Mainpiece fabricated rectangular, see Note 1	Breadth and width $\geq \delta_S$ $t_M = 8,5 + 0,56 \sqrt{\delta_S}^3 \sqrt{k} \text{ mm}$ Minimum fore and aft extent of side plate = $0,2 b_R$ Stress due to bending, see Table 13.2.9 Permissible stresses for rudder blade scantlings
	(5) Mainpiece tubular, see Note 1	Inside diameter $\geq \delta_S$ t_M as for (4) Side plating as for (1) Bending stress as for (4)
	(6) Mainpiece semi-spade (Mariner) type rudders in way of lower pintle regions, see Note 2	Bending moment applied at section 'AA' (see Figure 13.2.6 Main vertical web thickness) by the underhung position to result in stresses not greater than those given in Table 13.2.9 Permissible stresses for rudder blade scantlings
Single plated rudder construction	(7) Blade thickness	$t_B = 0,0015 V y_w + 2,5 \text{ mm}$ with a minimum of 10 mm
	(8) Arms	Spacing $\leq 1000 \text{ mm}$ $Z_A = 0,0005 V^2 x_a^2 y_w \text{ cm}^3$ thickness = t_B in mm with a minimum of 10 mm
	(9) Mainpiece	Diameter $\geq \delta_S$ for spade rudders, the lower third may be tapered down to $0,75 \delta_S \text{ mm}$ at the bottom end
Symbols		

b_R = mean breadth of rudder at centreline of stock, in mm

k = see Note 3

$$s_e = \sqrt{1,1 - 0,5 \left(\frac{s_{\min}}{s_{\max}} \right)^2} \text{ but not more than } 1,00 \text{ if } \frac{s_{\max}}{s_{\min}} \geq 2,5$$

s_{\max} = greatest unsupported width of plating, in metres

s_{\min} = smallest unsupported width of plating, in metres

t = thickness, in mm

t_W = thickness of webs, in mm

t_M = thickness of side plating and vertical webs forming mainpiece, in mm

t_N = thickness of nose plate, in mm

x_a = horizontal distance from the aft edge of the rudder to the centre of the rudder stock, in metres

y_w = vertical spacing of rudder arms, in mm. Not to exceed 1000 mm

A_R = rudder area, in m²

P_L = rudder force, as defined in Pt 3, Ch 3, 2.1 Definition of requirements

T = as given in Pt 3, Ch 1, 6.1 Principal particulars

V = as defined in Pt 3, Ch 3, 2.1 Definition of requirements

Z_A = section modulus of arm, in cm³

δ_S = basic stock diameter, given by Table 13.2.3 Rudder stock diameter, in mm

Note 1 The value of the basic stock diameter δ_S , used in (4) and (5), is that for mild steel, as given in Table 13.2.3 Rudder stock diameter.

Note 2 The effective breadth of the side plate may be taken as $0,16h_R$.

Note 3 For higher tensile steels, the material factor $k = 0,78$ for steels with $\delta_y = 315 \text{ N/mm}^2$ and $k = 0,72$ for steels with $\delta_y = 355 \text{ N/mm}^2$.

Table 13.2.9: Permissible stresses for rudder blade scantlings

Item	Permissible stresses, in N/mm ² (kgf/mm ²)		
	Bending stress	Shear stress	Equivalent stress
Rudder blades clear of cut-outs, see Figure 13.2.2 Rudder co-ordinate system	$\frac{110}{k} \left(\frac{11,2}{k} \right)$	$\frac{50}{k} \left(\frac{5,1}{k} \right)$	$\frac{120}{k} \left(\frac{12,2}{k} \right)$
Rudder blades in way of cut-outs, see Figure 13.2.2 Rudder co-ordinate system and Note	$\frac{75}{k} \left(\frac{7,6}{k} \right)$	$\frac{50}{k} \left(\frac{5,1}{k} \right)$	$\frac{100}{k} \left(\frac{10,2}{k} \right)$
Symbols			
k as defined in Pt 3, Ch 13, 1.2 General symbols			
Note Requirements in way of cut-outs apply to semi-spade/mariner type rudders.			

2.8 Rudder couplings

- 2.8.1 Rudder coupling design is to be in accordance with Table 13.2.10 Rudder couplings to stock - Bolted couplings .
- 2.8.2 Where coupling bolts are required they are to be fitted bolts. Suitable arrangements are to be made to lock the nuts.
- 2.8.3 For rudders with horizontal coupling arrangements the rudder stock should be forged when the stock diameter exceeds 350 mm. Where the stock diameter does not exceed 350 mm the rudder stock may be either forged or fabricated. Where the upper flange is welded to the rudder stock, a full penetration weld is required and its integrity is to be confirmed by non-destructive examination. The flange material is to be from the same welding materials group as the stock. Such rudder stocks are to be subjected to a furnace post-weld heat treatment (PWHT) after completion of all welding operations. For carbon or carbon manganese steels, the PWHT temperature is not to be less than 600°C.
- 2.8.4 For a spade rudder, the fillet radius between the rudder stock and the flange is to conform to the requirements of Figure 13.2.7 Rudder stock horizontal flange fillet radius for spade rudders. Where space permits between the upper face of the flange and the lowest main bearing, it is preferable to use a compound fillet design of the parabolic or Morgenbrod form having similar dimensions to those of Figure 13.2.7 Rudder stock horizontal flange fillet radius for spade rudders. Alternative arrangements will be specially considered.
- 2.8.5 The connecting bolts for coupling the rudder to the rudder stock are to be positioned with sufficient clearance to allow the fitting and removal of the bolts and nuts without contacting the palm radius, R , see Figure 13.2.8 Rudder stock connection(a). The surface forming the palm radius is to be free of hard and sharp corners and is to be machined smooth to the Surveyor's satisfaction. The surface in way of bolts and nuts is to be machined smooth to the Surveyor's satisfaction.
- 2.8.6 For spade rudders fitted with a fabricated rectangular mainpiece, the mainpiece is to be designed with its forward and aft transverse sections at equal distances forward and aft of the rudder stock transverse axis, see Figure 13.2.8 Rudder stock connection(b).
- 2.8.7 Where a rudder stock is connected to a rudder by a keyless fitting, the rudder is to be a good fit on the rudder stock cone. During the fit-up, and before the push-up load is applied, an area of contact of at least 80 per cent of the theoretical area of contact is to be achieved, and this is to be evenly distributed. The relationship of the rudder to stock at which this occurs is to be marked, and the push-up then measured from that point. The upper edge of the upper mainpiece bore is to have a slight radius. After final fitting of the stock to the rudder, positive means are to be used for locking the securing nut to the stock.
- 2.8.8 Where a keyed conical fitting of a rudder stock to a rudder is proposed, a securing nut is to be provided. Minimum dimensions for the securing nut are given in Table 13.2.10 Rudder couplings to stock - Bolted couplings. After final fitting of the stock to the rudder, positive means are to be used for locking this nut.
- 2.8.9 Guidelines for keys and keyways are given in Table 13.2.10 Rudder couplings to stock - Bolted couplings.

Figure 13.2.7: Rudder stock horizontal flange fillet radius for spade rudders

Figure 13.2.8: Rudder stock connection

Figure 13.2.9: Conical coupling

Table 13.2.10: Rudder couplings to stock - Bolted couplings

Item	Requirement	
	Horizontal coupling	Vertical coupling
Number of bolts in coupling	$n \geq 6$	$n \geq 8$
Diameter of coupling bolts	$\delta_b = 0,62 \sqrt{\frac{\delta_s^3 k_b}{l_a n k_s}}$	$\delta_b = 0,81 \delta_s \sqrt{\frac{k_b}{n k_s}}$
First moment of area of bolts about centre of coupling	$m = 0,00071 n \delta_s \delta_b^2 \sqrt{\frac{k_b}{k_s}}$	$m = 0,00043 \delta_s^3 \sqrt{\frac{k_b}{k_s}}$
Thickness of coupling flange	$t_f = \delta_b \sqrt{\frac{k_b}{k_s}}$ (see Notes 1 and 2)	$t_f = \delta_b$
Stress concentration factor for as built scantlings	α as built $\leq \alpha$ max (see Note 3)	—

Maximum allowable stress concentration factor	$\alpha_{\max} = (53,82 - 35,29k_{\max}) \frac{\delta_S^3}{hP_L 10^3} - \left(1,8 - 6,3 \frac{R}{\delta_S}\right) \frac{t_f - t_{fa}}{t_{fa}} \text{ (see Note 3)}$	–
Width of flange material outside the bolt holes	$w_f = 0,67 \delta_b$	$w_f = 0,67 \delta_b$
Symbols		
<p>$\alpha_{\text{as built}}$ = stress concentration factor for as built scantlings</p> $= \frac{0,73}{\sqrt{\frac{R}{\delta_S}}}$ <p>α_{\max} = maximum allowable stress concentration factor</p> <p>δ_b = diameter of coupling bolts, in mm</p> <p>δ_S = basic stock diameter as defined in Table 13.2.3 Rudder stock diameter, in mm</p> <p>b_f = breadth of the flange, in mm</p> <p>h = vertical distance, in metres, between the centre of pressure and the centre point of the palm radius, see Figure 13.2.8 Rudder stock connection</p> <p>k_b = coupling bolt material factor, see Pt 3, Ch 13, 2.5 Rudder stock and bearings</p> <p>k_{\max} = the greater of k_s and k_f</p> <p>k_f = upper coupling flange material factor, see Pt 3, Ch 13, 2.5 Rudder stock and bearings</p> <p>k_s = rudder stock material factor, see Pt 3, Ch 13, 2.5 Rudder stock and bearings</p> <p>l_a = the mean of the horizontal distances between the centres of the bolts and the centre of the coupling, in mm</p> <p>m = first moment of area of bolts about a longitudinal axis through centre of coupling, in cm³</p> <p>n = number of bolts in coupling</p> <p>P_L = lateral force on rudder as defined in Pt 3, Ch 13, 2.2 Lateral force on rudder blade, in N (tonne-f)</p> <p>R = palm radius, in mm, between the rudder stock and connection flange, see Pt 3, Ch 13, 2.8 Rudder couplings and Pt 3, Ch 13, 2.8 Rudder couplings.</p> <p>t_f = minimum thickness of coupling flange, in mm</p>		

t_{fa} = as built flange thickness, in mm

w_f = width of flange material outside the bolt holes, in mm

Note 1. For spade rudders with horizontal couplings, t_f is not to be less than $0,33 \delta_s \sqrt[3]{k_s}$. The mating plate on the rudder is to have the same thickness as the flange on the stock

Note 2. For a twin spade rudder arrangement with single screw where the rudders are within the slipstream of the propeller: (a) the thickness of the palm is not to be less than $0,35 \delta_s \sqrt[3]{k_s}$ (b) where the stock is welded to the palm plate, the stock diameter, δ_s is to be increased by 14%.

Note 3 This requirement is applicable only for spade rudders with horizontal couplings, see Figure 13.2.6 Main vertical web thickness.

Table 13.2.11: Rudder couplings to stock - Conical couplings

Item	Requirement
Taper of conical coupling on the diameter	$\theta_t \leq \frac{1}{K_1}$
Length of taper	$l_t \geq 1,5 \delta_s$
Required mean grip stress – keyless connection	$p_M = \frac{P_R \theta_t \delta_{CTM} + 4M_T 10^3 \sqrt{K_2 \left(\left[\frac{P_R \delta_{CTM}}{2000M_T} \right]^2 + 1 \right) - \left(\frac{\theta_t}{2} \right)^2}}{5,03 \delta_{CTM}^2 l_t \left(K_2 - \left(\frac{\theta_t}{2} \right)^2 \right)}$
Required mean grip stress – keyed connection	$p_M = 20$
Corresponding push-up of rudder stock	$w = \frac{9,6 \cdot 10^{-6} p_M \delta_{CTM}}{\theta_t (1 - f_{M^2})} \left(\frac{0,95 \cdot 10^{-4} p_M \delta_{CTM}}{\theta_t (1 - f_{M^2})} \right)$
Corresponding push-up load	Approximately equal to $P_U = 0,8 \pi p_M l_t \delta_{CTM} \left(k_3 + \frac{\theta_t}{2} \right)$
Corresponding pull-off load	Approximately equal to $P_O = 2,83 p_M l_t \delta_{CTM} \left(k_3 - \frac{\theta_t}{2} \right)$
Minimum yield stress of stock and gudgeon	$\sigma_o = \frac{123500 w \theta}{\delta_{CT}} \sqrt[4]{3 + f^4} \left(\frac{12600 w \theta}{\delta_{CT}} \sqrt[4]{3 + f^4} \right)$
Recommended minimum effective sectional area of the key in shear	$A_{key} = \frac{M_T k_{min}}{3,3 \delta_{CTM}}$ see Note
Minimum thickness of key	$\delta_{key} = \frac{67 A_{key}}{H}$
Minimum dimensions of securing nut	$\delta_g = 0,65 \delta_s$ $\delta_n = 1,2 \delta_{SU}$ or $1,5 \delta_g$ whichever is the greater $h_n = 0,6 \delta_g$

Symbols
h_n = minimum required length of securing nut, in mm, see Figure 13.2.8 Rudder stock connection
$f = \frac{\delta_{CT}}{\delta_{GH}}$
$f_M = \frac{\delta_{CTM}}{\delta_{GHM}}$
k_{min} = taken as k_0 , where σ_0 is the minimum nominal upper yield point of the key, stock or coupling material, in N/mm ² , whichever is less
k_0 = material factor as defined in Table 13.2.3 Rudder stock diameter, for the appropriate item
l_t = length of taper, in mm
p_M = required mean grip stress, in N/mm ²
w = corresponding push-up of rudder stock, in mm
A_{key} = recommended minimum effective sectional area of the key in shear, in cm ²
H = length of the key, in mm
M_T = rudder torque, in Nm, as given in Table 13.2.5 Permissible stresses
P_R = effective weight of rudder, in N (kgf)
P_U, P_O = corresponding push-up, pull-off loads respectively, in N (kgf)
δ_g = minimum external thread diameter, in mm, see Figure 13.2.8 Rudder stock connection
δ_n = minimum outer diameter of nut, in mm, see Figure 13.2.8 Rudder stock connection
δ_{CT} = diameter of coupling taper in any position, in mm
δ_{CTM} = mean diameter of coupling taper, in mm
$= \frac{\delta_S + \delta_{SU}}{2}$
δ_{GH} = external diameter of gudgeon housing at any position, in mm
δ_{GHM} = mean external diameter of gudgeon housing, in mm
δ_{key} = minimum thickness of key. See Figure 13.2.8 Rudder stock connection

δ_{SU} = see Figure 13.2.8 Rudder stock connection, in mm

σ_o = minimum yield stress of stock and gudgeon material, in N/mm² (kgf/mm²) σ_o is not to be taken greater than 70% of the ultimate tensile strength or 450 N/mm² (45,9 kgf/mm²) whichever is the lesser

θ_t = taper of conical coupling, on the diameter, e.g. $\frac{1}{15} = 0,067$

K_1, K_2, K_3 = constants depending on the type of assembly adopted as follows:

Type of assembly		K_1	K_2	K_3
Oil injection	With key	12	—	0,025
	Without key	15	0,0036	0,025
Dry fit method	With key	8	—	0,170
	Without key	12	0,0072	0,170
Note The keyway is to have a smooth fillet at the bottom of the keyway. The radius of the fillet is to be at least 0,0125 of the diameter of the rudder stock at the top of the cone.				

2.9 Pintles

2.9.1 Rudder pintles and their bearings are to comply with the requirements of Table 13.2.12 Pintle requirements.

2.9.2 The distance between the lowest rudder stock bearing and the upper pintle should be as short as possible.

Table 13.2.12: Pintle requirements

Item	Requirement	
(1) Pintle diameter	$\delta_{PL} = 0,35\sqrt{B k_o}$ mm	
(2) Pintle taper	Method of assembly	Taper (on diameter)
	Keyed and other manually assembled pintles	1:8 – 1:12
	Pintles mounted with oil injection and hydraulic nut	1:12 – 1:20
Symbols		
<p>b = distance in metres, from centroid of rudder area to the centre of lowest main bearing, see Figure 13.2.4 Centroid of rudder area for common rudder types</p> <p>c = distance, in metres, from centre of bearing of lower pintle to the centre of lowest main bearing, see Figure 13.2.4 Centroid of rudder area for common rudder types</p> <p>k_o = as defined in Table 13.2.3 Rudder stock diameter or Table 13.2.4 Material factor k_o</p> <p>B = bearing force, in N. If direct calculations are not carried out, the bearing force at various positions can be taken as:</p> <p>$B_{1L} = \frac{b}{c} P_L$ for single pintle rudders and lower pintle of semi – spade rudders</p> <p>$B_{1U} = \left(1 - \frac{b}{c}\right) P_L$ at upper pintle on semi – spade rudder. B_{1U} is not to be less than $0,35P_L$</p> <p>$B = \frac{1}{N_{PL}} P_L$ for rudders with two or more pintles (except semi – spade rudders)</p> <p>N_{PL} = number of pintles on the rudder</p> <p>P_L = rudder force, as defined in Pt 3, Ch 13, 2.2 Lateral force on rudder blade</p>		
Note The length of the pintle housing in the gudgeon is not to be less than the maximum pintle diameter.		

2.9.3 Where liners are fitted to pintles, they are to be shrunk on or otherwise efficiently secured. If liners are to be shrunk on, the shrinkage allowance is to be indicated on the plans. Where liners are formed by stainless steel weld deposit, the pintles are to be of weldable quality steel and details of the procedure are to be submitted, see also Pt 3, Ch 13, 2.10 Ancillary items.

2.9.4 The bottom pintle on semi-spade (Mariner) type rudders and all pintles over 500 mm in diameter are:

- if inserted into their sockets from below, to be keyed to the rudder or sternframe as appropriate or to be hydraulically assembled, with the nut adequately locked, or
- if inserted into their sockets from above, to be provided with an appropriate locking device, the nut being adequately secured.

2.9.5 Fitting of pintle bearings is to be carried out in accordance with the bearing manufacturer's recommendations to ensure that they remain secure under all foreseen operating conditions.

2.9.6 Where an ***IWS** (In-water Survey) notation is to be assigned (see Pt 1, Ch 2, 2.3 Class notations (hull)), means are to be provided for ascertaining the rudder pintle and bush clearances and for verifying the security of the pintles in their sockets with the vessel afloat.

2.9.7 For axle type rudder support used with Simplex rudders, see Pt 3, Ch 6, 7 Sternframes and appendages.

2.10 Ancillary items

2.10.1 Internal surfaces of double plate rudders are to be efficiently coated. Alternatively, where it is intended to fill the rudder with plastic foam or use a corrosion inhibitor, details are to be submitted. Means for draining the rudder are to be provided.

2.10.2 Where a bow rudder is fitted for use when navigating astern, a locking device is to be arranged to ensure that the rudder is kept in the central position when the ship is navigating ahead.

2.10.3 Where the weight of the rudder is supported by a carrier bearing attached to the rudder head, the structure in way is to be adequately strengthened. The plating under all rudder head bearings or rudder carriers is to be increased in thickness.

2.10.4 Where it is proposed to use stainless steel for liners or bearings for rudder stocks and/or pintles, the chemical composition is to be submitted for approval. Synthetic rudder bearing materials are to be of a type approved by Lloyd's Register (hereinafter referred to as 'LR'). When this type of lining material is used, arrangements to ensure an adequate supply of sea-water to the bearing are to be provided.

■ Section 3 Fixed and steering nozzles

3.1 General

3.1.1 The requirements for scantlings for fixed and steering nozzles are given, for guidance only, in Pt 3, Ch 13, 3.2 Nozzle structure to Pt 3, Ch 13, 3.4 Ancillary items and Table 13.3.1 Nozzle construction requirements.

3.1.2 The requirements, in general, apply to nozzles with a numeral not greater than 200, see Table 13.3.1 Nozzle construction requirements. Nozzles exceeding this value will be specially considered.

Table 13.3.1: Nozzle construction requirements

Item	Requirement
(1) Nozzle numeral	$N_N = 0,01P\delta_p$ $(N_N = 0,00736H\delta_p)$
(2) Shroud plating in way of propeller blade tips	For $N_N \leq 63$ $t_s = (11 + 0,1 N_N)$ mm For $N_N > 63$ $t_s = (14 + 0,052N_N)$ mm
(3) Shroud plating clear of blade tips, flare and cone plating, wall thickness of leading and trailing edge members	$t_p = (t_s - 7)$ mm but not less than 8 mm
(4) Webs and ring webs	As item (3) except in way of headbox and pintle support where $t_w = (t_s + 4)$ mm
(5) Nozzle stock	Combined stresses in stock at lower bearing $\leq 92,7 \text{ N/mm}^2$ (9,45 kgf/mm ²) Torsional stress in upper stock $\leq 62,0 \text{ N/mm}^2$ (6,3 kgf/mm ²)
(6) Solepiece and strut	Bending stresses not to exceed $70,0 \text{ N/mm}^2$ (7,1 kgf/mm ²)
Symbols	

N_N = a numeral dependent on the nozzle requirements

P = power transmitted to the propellers, in kW

(H = power transmitted to the propellers, in shp)

δ_p = diameter of the propeller, in metres

t_s = thickness of shroud plating in way of propeller tips, in mm

t_p = thickness of plating, in mm

t_w = thickness of webs and ring webs in way of headbox and pintle support, in mm

Note Thicknesses given are for mild steel. Reductions in thickness will be considered for certain stainless steels.

3.2 Nozzle structure

3.2.1 For basic scantlings of the structure, see Table 13.3.1 Nozzle construction requirements, in association with Figure 13.3.1 Nozzle construction.

3.2.2 The shroud plating in way of the propeller tips is to be carried well forward and aft of this position, due allowance being made on steering nozzles for the rotation of the nozzle in relation to the propeller.

3.2.3 Fore and aft webs are to be fitted between the inner and outer skins of the nozzle. Both sides of the headbox and pintle support structure are to be connected to fore and aft webs of increased thickness. For thicknesses, see Table 13.3.1 Nozzle construction requirements.

Figure 13.3.1: Nozzle construction

3.2.4 The transverse strength of the nozzle is to be maintained by the fitting of ring webs. Two ring webs are to be fitted in nozzles not exceeding 2,5 m diameter. Nozzles between 2,5 and 3,0 m in diameter are generally to have two full ring webs and a half-depth web supporting the flare plating. The number of ring webs is to be increased as necessary on nozzles exceeding 3,0 m in diameter. Where ring webs are increased in thickness in way of the headbox and pintle support structure in accordance with Table 13.3.1 Nozzle construction requirements, the increased thickness is to be maintained to the adjacent fore and aft web.

3.2.5 Local stiffening is to be fitted in way of the top and bottom supports which are to be integrated with the webs and ring webs. Continuity of bending strength is to be maintained in these regions.

3.2.6 Fin plating thickness should be not less than the cone plating, and the fin should be adequately reinforced. Solid fins should be not less than 25 mm thick.

3.2.7 Care is to be taken in the manufacture of the nozzle to ensure its internal preservation and watertightness. The preservation and testing are to be as required for rudders, see Pt 3, Ch 13, 2.7 Rudder construction – Single plated and Table 1.9.1 Testing requirements in Pt 3, Ch 1 General.

3.3 Nozzle stock and solepiece

3.3.1 Stresses, derived using the maximum side load on the nozzle and fin acting at the assumed centre of pressure, are not to exceed the values given in Table 13.3.1 Nozzle construction requirements, in both the ahead and astern conditions.

3.4 Ancillary items

3.4.1 The diameter and first moment of area about the stock axis of coupling bolts and the diameter of pintles, are to be derived from Pt 3, Ch 13, 2.5 Rudder stock and bearings and Pt 3, Ch 13, 2.6 Rudder construction – Double plated.

3.4.2 Suitable arrangements are to be provided to prevent the steering nozzle from lifting.

■ *Section 4* **Steering gear and allied systems**

4.1 General

4.1.1 For the requirements of steering gear, see Pt 5, Ch 19 Steering Arrangements.

■ *Section 5* **Bow and stern thrust unit structure**

5.1 Unit wall thickness

5.1.1 The wall thickness of the unit is, in general, to be in accordance with the manufacturer's practice, but is to be not less than either the thickness of the surrounding shell plating plus 10 per cent or 15 mm, whichever is greater.

5.2 Framing

5.2.1 The unit is to be framed to the same standard as the surrounding shell plating.

5.2.2 The unit is to be adequately supported and stiffened.

■ *Section 6* **Stabiliser structure**

6.1 Fin stabilisers

6.1.1 The box into which the stabilisers retract is to have perimeter plating of the same thickness as the surrounding Rule shell plating plus 2 mm, but is to be not less than 12,5 mm, and is to be stiffened to the same standard as the shell.

6.1.2 The stabiliser machinery and surrounding structure is to be adequately supported and stiffened. Where bending stresses are induced in the structure under fatigue conditions the maximum stress is not to exceed 39,0 N/mm² (4 kgf/mm²).

6.2 Stabiliser tanks

6.2.1 The general structure of the tank is to comply with the Rule requirements for deep tanks. Sloshing forces in the tank structure are to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculation.

Section 7 Equipment

7.1 General

7.1.1 To entitle a ship to the figure **1** in its character of classification, equipment in accordance with the requirements of Table 13.7.1 Equipment requirements is to be provided. The regulations governing the assignment of the character figure **1** for equipment are given in Pt 1, Ch 2, 2 Character of classification and class notations.

7.1.2 For ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) to Pt 1, Ch 2, 2.3 Class notations (hull), equipment differing from these requirements may be approved if considered suitable for the particular service on which the ship is to be engaged, see *also* Table 13.7.1 Equipment requirements.

7.1.3 Where the Committee has agreed that anchoring and mooring equipment need not be fitted in view of the particular service of the ship, the character letter **N** will be assigned, see *also* Pt 1, Ch 2, 2.2 Character symbols.

Table 13.7.1: Equipment requirements

Ship type	Service	Required equipment
Cargo ships, bulk carriers, tankers, ferries, dredgers, etc. (see Pt 3, Ch 13, 1.1 Application)	Unrestricted service	(1) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length, using N_C
Ferries	Certain restricted Services, see Pt 1, Ch 2, 2.3 Class notations (hull)	<p>(2) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length, using N_C and N_A as appropriate</p> <p>Mass of bower anchor $N_A = \text{one grade below } N_C$</p> <p>Chain cable length and diameter $N_A = \text{one grade below } N_C$</p> <p>Stream anchor may be omitted</p>
		<p>As per item (2), also</p> <p>Anchor chains Where $L < 30$ m, may be replaced with wire ropes of equal minimum breaking strength which should:</p>

Ship Control Systems

Part 3, Chapter 13

Section 7

Ferries	Specified coastal service, see Pt 1, Ch 2, 2.3 Class notations (hull)	<p>(a) have a length 1,5 times that for chain cable required by Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and</p> <p>(b) have a length of Grade U2/U1 chain cable not less than 12,5 m between anchor and wire rope.</p> <p>Where $30\text{ m} \leq L \leq 40\text{ m}$ one chain cable may be replaced with wire rope meeting the requirements of $L > 40\text{ m}$. The other may be replaced with wire rope meeting the requirements of $L < 30\text{ m}$.</p> <p>Where $40\text{ m} < L \leq 90\text{ m}$, both chain cables may be replaced with wire rope of equal minimum breaking strength which should</p> <p>(a) have a length 1,5 times that for chain cable required by Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and</p> <p>(b) have a minimum mass per unit length of 30% that of Grade U2 chain cable required by Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and</p> <p>(c) have a length of Grade U2/U1 chain cable not less than 12,5 m between anchor and wire rope.</p>
Dredging and reclamation craft	Extended protected waters service, see Pt 1, Ch 2, 2.3 Class notations (hull)	<p>(4) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length, using N_C and N_A as appropriate</p> <p>$N_A = N_C$ reduced by two grades, except for stream anchors, or mooring lines</p> <p>Stream anchor – not required if ship fitted with positioning spuds</p>
	Protected waters service, see Pt 1, Ch 2, 2.3 Class notations (hull)	<p>5) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length using N_C and N_A as appropriate</p> <p>Mass of bower anchor $N_A = 0,5N_C$</p> <p>Chain cable diameter $N_A = 0,5N_C$</p> <p>Bower anchors powered ships – two anchors</p> <p>Bower anchors unpowered (manned) ships – one anchor</p> <p>Chain cable length – greater of $2L$ m or $10,0T_D$ m, but need not exceed requirements for an ordinary cargo ship with anchors of the same mass</p> <p>Mooring lines – as required for N_C</p> <p>Wire ropes – may be substituted for chain cable on bower anchors if breaking strength $\geq 1,5$ times that of the chain cable</p>

Ship Control Systems

Part 3, Chapter 13

Section 7

	Unrestricted service	<p>(6) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length, and Notes to Table Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length using N_C</p> <p>Anchor chains Where $L < 30$ m, may be replaced with wire ropes of equal strength. Where $30 \text{ m} \leq L \leq 40$ m, one chain cable may be replaced with wire rope of equal strength provided normal chain cable maintained for the second line</p> <p>Wire ropes of trawl winches complying with above may be used as anchor cables. Wire ropes substituted for anchor chains should</p> <p>(a) have a length 1,5 times that for chain cable required by Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and</p> <p>(b) have a length Grade U2/U1 of chain not less than 12,5 m between anchor and wire rope.</p> <p>Hawsers and warps – Sufficient in number and strength for proper working of the ship</p>
Tugs	Unrestricted and restricted service	<p>(7) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length using N_C except as stated below</p> <p>Stream anchor – not required</p> <p>Towlines – adequate for tug's maximum bollard pull with factor of safety $\geq 2,0$</p>
	Service restricted, see Pt 1, Ch 2, 2.3 Class notations (hull) to Pt 1, Ch 2, 2.3 Class notations (hull)	<p>(8) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length using N_C</p> <p>Mass of bower anchor reduced to correspond to two Equipment Letters below that required for N_C</p> <p>Chain cable diameter reduced to correspond to two Equipment Letters below that required for N_C</p> <p>Anchor chains As item (3) in this Table</p>
	Protected waters service, See Pt 1, Ch 2, 2.3 Class notations (hull)	<p>9) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length using N_A</p> <p>Mass of bower anchor $N_A = 0,5N_C$</p> <p>Chain cable diameter $N_A = 0,5N_C$</p> <p>Chain cable length = 0,5 times length required by N_A</p> <p>Where $N_C < 90$, the requirements for anchors and chain cable will be specially considered</p> <p>Anchor chains As item (3) in this Table</p>
Offshore supply ships	Unrestricted service	<p>10) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length, using N_C</p> <p>Chain cable length and diameter – increased to correspond to two Equipment and diameter Letters above that required for N_C. Need not be applied for ships with DP(AAA), DP(AA) or DP(AM) notations</p>

Manned barges and pontoons	Service restricted, see Pt 1, Pt 1, Ch 2, 2.3 Class notations (hull) to Pt 1, Ch 2, 2.3 Class notations (hull)	(11) As item (4) in this Table
Unmanned barges and pontoons	Unrestricted service, or service restricted, see Pt 1, Ch 2, 2.3 Class notations (hull) to Pt 1, Ch 2, 2.3 Class notations (hull)TT	<p>(12) See Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length and Pt 3, Ch 13, 7.6 Towlines and mooring lines for ships over 90 m in length, using N_C and N_A as appropriate</p> <p>Anchors $L < 30$ m, no anchor need be carried</p> <p>Anchors $L \geq 30$ m, one anchor to be fitted</p> <p>Anchor cable length – greater of 40 m or $2L$ m</p> <p>(a) Unrestricted service: mass of anchors and chain cable diameters as for N_C</p> <p>(b) Protected water service, see Pt 1, Ch 2, 2.3 Class notations (hull): mass of anchors and chain cable diameters, $N_A = 0,5N_C$</p> <p>(c) Service restriction, see Pt 1, Ch 2, 2.3 Class notations (hull) to Pt 1, Ch 2, 2.3 Class notations (hull): mass of anchor and chain cable diameter, N_A reduced to correspond to two Equipment Letters below N_C</p> <p>Mooring lines $L < 65$ m, two mooring lines to be fitted</p> <p>$L \geq 65$ m, three mooring lines to be fitted length of mooring lines to be the greater of $2L$ or 80 m, but need not exceed that for manned ships Strength of each line to be that required by NC Consideration will be given to proposals to omit anchoring equipment in association with the assignment of the character figure 1, See Pt 1, Ch 2, 2.2 Character symbols. Where $L < 65$ m consideration will be given to the omission of anchoring and mooring equipment, in which case the character letter N will be assigned in the character of classification, see Pt 1, Ch 2, 2.2 Character symbols</p>
Symbols		
<p>L = length of ship as defined in Pt 3, Ch 1, 6.1 Principal particulars</p> <p>N_A = actual equipment number to be used, if different from N_C</p> <p>N_C = calculated equipment number for ship as required by Pt 3, Ch 1, 7.1 Calculation of Equipment Number</p> <p>T_D = maximum depth at which ship is designed to dredge, in metres</p>		

7.1.4 Where the ship is intended to perform its primary designed service function only while it is anchored, moored, towed or linked, the character letter **T** will be assigned, see also Pt 1, Ch 2, 2.2 Character symbols.

7.1.5 For classification purposes, the character figure **1**, or either of the character letters **N** or **T**, is to be assigned.

7.2 Anchors

7.2.1 Anchors are to be of an approved design. The design of all anchor heads is to be such as to minimise stress concentrations, and in particular, the radii on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.

7.2.2 Anchors which must be specially laid the right way up, or which require the fluke angle or profile to be adjusted for varying types of sea bed, will not generally be approved for normal ship use, but may be accepted for offshore units, floating cranes, etc. In such cases suitable tests may be required.

7.2.3 The mass of each bower anchor given in Table 13.7.2 Equipment - Bower anchors and chain cables is for anchors of equal mass. The masses of individual anchors may vary by ± 7 per cent of the masses given in the Table, provided that the total mass of the anchors is not less than would have been required for anchors of equal mass.

7.2.4 The mass of the head, including pins and fittings, of an ordinary stockless anchor is to be not less than 60 per cent of the total mass of the anchor.

7.2.5 When stocked bower or stream anchors are to be used, the mass 'ex-stock' is to be not less than 80 per cent of the mass given in Table 13.7.2 Equipment - Bower anchors and chain cables for ordinary stockless bower anchors. The mass of the stock is to be 25 per cent of the total mass of the anchor, including the shackle, etc. but excluding the stock.

7.3 High holding power anchors

7.3.1 When high holding power anchors are used as bower anchors, the mass of each such anchor may be 75 per cent of the mass given in the Table for ordinary stockless bower anchors.

7.3.2 Anchor designs for which approval is sought as high holding power anchors are to be tested at sea to show that they have holding powers of at least twice those of approved standard stockless anchors of the same mass.

7.3.3 If approval is sought for a range of sizes, then at least two sizes are to be tested. The smaller of the two anchors is to have a mass not less than one-tenth of that of the larger anchor, and the larger of the two anchors tested is to have a mass not less than one-tenth of that of the largest anchor for which approval is sought.

7.3.4 High holding power anchors are to be of a design that will ensure that the anchors will take effective hold of the sea bed without undue delay and will remain stable, for holding forces up to those required by Pt 3, Ch 13, 7.3 High holding power anchors, irrespective of the angle or position at which they first settle on the sea bed when dropped from a normal type of hawse pipe. In case of doubt, a demonstration of these abilities may be required.

7.3.5 The test should normally be carried out from a tug or other suitable vessel, and the pull measured by dynamometer or derived from recently verified curves of tug rev/min against bollard pull. The tests are to be conducted on no fewer than three different types of bottom, which should normally be soft mud or silt, sand or gravel, and hard clay or similarly compacted material. A scope of 10 is recommended for the anchor cable, but in no case should a scope of less than six be used. The same scope is to be used for the anchor for which approval is sought and the anchor that is being used for comparison purposes.

7.4 Chain cables

7.4.1 Chain cables may be of mild steel, special quality steel or extra quality steel in accordance with the requirements of Ch 10 Equipment for Mooring and Anchoring and are to be graded in accordance with Table 13.7.5 Chain cable steel grades.

7.4.2 Grade U1 material having a tensile stress of less than 400 N/mm² (41 kgf/cm²) is not to be used in association with high holding power anchors. Grade U3 material is to be used only for chain 20,5 mm or more in diameter.

7.4.3 Where stream anchors are used in association with chain cable, this cable may be either stud link or short link.

7.4.4 The form and proportion of links and shackles are to be in accordance with Ch 10 Equipment for Mooring and Anchoring of the Rules for Materials.

7.4.5 Where Owners require equipment for anchoring at depths greater than 82,5 m, it is their responsibility to specify the appropriate total length of the chain cable required for this purpose. In such cases, consideration can be given to dividing the chain cable into two unequal lengths.

7.5 Towlines and mooring lines for ships under 90 m in length

7.5.1 **Ships under 90 m** require mooring lines as specified in Table 13.7.3 Equipment - Stream anchors, stream wires, towlines and mooring lines. Towlines are not required for classification and the details given in the Table are for guidance purposes only. Mooring lines may be of wire, natural fibre or synthetic fibre. The diameter, construction and specification of wire or natural fibre mooring lines are to comply with the requirements of Ch 10 Equipment for Mooring and Anchoring of the Rules for Materials. Where it is proposed to use synthetic fibre ropes, the size and construction will be specially considered.

7.6 Towlines and mooring lines for ships over 90 m in length

7.6.1 **Ships 90 m and over** in length do not require towlines and mooring lines as a classification item. It is recommended, however, that the number, length and strength of mooring lines provided on board the ship not be less than that given in Table 13.7.3 Equipment - Stream anchors, stream wires, towlines and mooring lines.

Ship Control Systems

Part 3, Chapter 13

Section 7

Table 13.7.2: Equipment - Bower anchors and chain cables

Equipment number		Equipment Letter	Stockless bower anchors		Stud link chain cables for bower anchors			
Exceeding	Not Exceeding		Number	Mass of anchor, in kg	Total length, in metres	Diameter, in mm		
						Mild steel (Grade 1 or U1)	Special quality steel (Grade U2)	Extra special quality steel (Grade U3)
50	70	A	2	180	220	14	12,5	-
70	90	B	2	240	220	16	14	-

14600	16000	O*	-	-	-	-	-		21	200	736

Note 1. Towline specified for guidance only, see Pt 3, Ch 13, 7.5 Towlines and mooring lines for ships under 90 m in length. For tugs see Table 13.7.1 Equipment requirements item (6).

Note 2. The rope used for stream wire is to be constructed of not less than 72 wires, made up into six strands.

Note 3. Wire ropes used for towlines and mooring lines are generally to be of a flexible construction with not less than: 144 wires in six strands with seven fibre cores for strengths up to 490 kN (50 tonne-f). 222 wires in six strands with one fibre core for strengths exceeding 490 kN (50 tonne-f). The wires laid round the fibre centre of each strand are to be made up in not less than two layers.

Note 4. Wire ropes for towlines and mooring lines used in association with mooring winches (on which the rope is stored on the winch drum) are to be of suitable construction.

Note 5. The lengths of individual mooring lines may be reduced by up to seven per cent of the Table length, provided that the total length of mooring lines is not less than would have resulted had all lines been of equal length.

Note

6. Tests. See Ch 10 Equipment for Mooring and Anchoring for wire ropes and fibre ropes respectively.

Note 7. For individual mooring lines with breaking strength above 490 kN the breaking strength may be reduced with corresponding increase of the number of the mooring lines and vice versa, provided that the total breaking strength of all lines aboard the ship is not less than the Rule value. In this case the number of lines is not to be less than 6 and no one line is to have a strength of less than 490 kN.

Note 8. Where wire rope is used in lieu of chain cable for anchoring, see Table 13.7.1 Equipment requirements, galvanised wire rope with an independent wire core in accordance with Ch 10, 6 Steel wire ropes of the Rules for Materials is to be used. Wire rope terminal fittings are to comply with an acceptable code or standard. The strength of terminations, connecting fittings, shackles or links is not to be less than that of the anchor line.

Ship Control Systems

Part 3, Chapter 13

Section 7

Table 13.7.4: Trawlers, stern trawlers and fishing vessels

Equipment number		Stockless bower anchors		Stud link chain cables for bower anchors		
					Diameter, in mm

550	600	2	1740	440,0	42,0	36,0
600	660	2	1920	440,0	44,0	38,0
660	720	2	2100	440,0	46,0	40,0

Table 13.7.5: Chain cable steel grades

Grade	Material	Tensile strength	
		N/mm ²	(kgf/mm ²)
U1	Mild steel	300 - 490	(31 - 50)
U2 (a)	Special quality steel (wrought)	490 - 690	(50 - 70)
U2 (b)	Special quality steel (cast)	490 - 690	(50 - 70)
U3	Extra special quality steel	690 min.	(70 min.)

7.6.2 For ease of handling, fibre ropes are to be not less than 20 mm in diameter. All ropes having breaking strengths in excess of 736,0 kN (75,0 tonne-f) and used in normal mooring operations are to be handled by, and stored on, suitably designed winches. Alternative methods of storing should give due consideration to the difficulties experienced in manually handling ropes having breaking strengths in excess of 490,0 kN (50,0 tonne-f).

7.6.3 Mooring winches should be fitted with drum brakes, the strength of which is sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 per cent of the breaking strength of the rope as fitted on the first layer on the winch drum.

Section 8

Windlass design and testing

8.1 Windlass design

8.1.1 A windlass of sufficient power and suitable for the size of chain is to be fitted to the ship. Where Owners require equipment significantly in excess of Rule requirements, it is their responsibility to specify increased windlass power.

8.1.2 The following performance criteria are to be used as a design basis for the windlass:

(a) The windlass is to have sufficient power to exert a continuous duty pull over a period of 30 minutes of:

- for specified design anchorage depths up to 82,5 m:

Chain cable grade	Duty pull, P , in N (kgf)
U1	$37,5d_c^2$ ($3,82d_c^2$)
U2	$42,5d_c^2$ ($4,33d_c^2$)
U3	$47,5d_c^2$ ($4,84d_c^2$)

- for specified design anchorage depths greater than 82,5 m:

$$P_1 = P + (D_a - 82,5) 0,27d_c^2 \text{N}$$

$$\left[P_1 = P + (D_a - 82,5) 0,0275d_c^2 \text{kgf} \right]$$

where

= d_c is the chain diameter, in mm

= D_a is the specified design anchorage depth, in metres

= P is the duty pull for anchorage depth up to 82,5 m

= P_1 is the duty pull for anchorage depths greater than 82,5 m.

(b) The windlass is to have sufficient power to exert, over a period of at least two minutes, a pull equal to the greater of:

(i) short term pull:

1,5 times the continuous duty pull as defined in Pt 3, Ch 13, 8.1 Windlass design, or

(ii) anchor breakout pull:

$$12,18W_a + \frac{7,0L_c d_c^2}{100} \text{N}$$

$$\left(1,24W_a + \frac{7,1L_c d_c^2}{1000} \text{kgf} \right)$$

where:

L_c = is the total length of chain cable on board, in metres, as given by Table 13.7.2 Equipment - Bower anchors and chain cables

W_a = is the mass of bower anchor (kg) as given in Table 13.7.2 Equipment - Bower anchors and chain cables.

- (c) The windlass, with its braking system in action and in conditions simulating those likely to occur in service, is to be able to withstand, without permanent deformation or brake slip, a load, applied to the cable, given by:

$$K_b d_c^2 (44 - 0,08d_c) \text{ N}$$

$$(K_b d_c^2 (44 - 0,08d_c) \text{ kgf})$$

where K_b is given in Table 13.8.1 Values of K_b .

The performance criteria are to be verified by means of shop tests in the case of windlasses manufactured on an individual basis. Windlasses manufactured under LR's *Type Approval Scheme for Marine Engineering Equipment* will not require shop testing on an individual basis.

Table 13.8.1: Values of K_b

Cable grade	K_b	
	Windless used in conjunction with chain stopper	Chain stopper not fitted
	N (kgf)	N (kgf)
U1	4,41 (0,45)	7,85 (0,8)
U2	6,18 (0,63)	11,0 (1,12)
U3	8,83 (0,9)	15,7 (1,6)

8.1.3 Calculations for torque transmitting components are to be based on 1500 hours of operation with a nominal load spectrum factor of $K_m = 1,0$. Alternatively unlimited hours with $K_m = 0,8$ can be applied.

8.1.4 Where the available input torque exceeds the torque required for anchor breakout then torque overload protection is to be fitted.

8.1.5 An arrangement to release the anchor and chain in the event of windlass power failure is to be provided.

8.1.6 The design of the windlass is to be such that the following requirements or equivalent arrangements will minimise the probability of the chain locker or forecable being flooded in bad weather:

- a weathertight connection can be made between the windlass bedplate, or its equivalent, and the upper end of the chain pipe, and
- access to the chain pipe is adequate to permit the fitting of a cover or seal, of sufficient strength and proper design, over the chain pipe while the ship is at sea.

8.2 Calculations

8.2.1 Where shop testing is not possible and Type Approval has not been obtained, calculations demonstrating compliance with Pt 3, Ch 13, 8.1 Windlass design are to be submitted together with detailed plans and an arrangement plan showing the following components:

- Shafting
- Gearing
- Brakes
- Clutches

8.2.2 The maximum stress from load cases stated in Table 13.8.2 Design load cases for windlass and chainstopper are not to exceed the limits stated in Table 13.8.3 Permissible stress for design load cases.

Table 13.8.2: Design load cases for windlass and chainstopper

Load case	Condition	Note
1	Continuous pull	See Pt 3, Ch 13, 8.1 Windlass design
2	Over load pull	See Pt 3, Ch 13, 8.1 Windlass design
3	Brake holding load	See Pt 3, Ch 13, 8.1 Windlass design

Table 13.8.3: Permissible stress for design load cases

	Load case	
Stress	1 and 2	3
	Permissible stress	
Tension	0,8Y	0,9Y
Compression or bending	0,8Y	0,9Y
Shear	0,7Y	0,7Y
Combined	0,85Y	0,9Y

Note 1. Where a component is subjected to axial tensile, axial compressive, bending or shear stress, F_c is to be calculated in the normal manner.

Note 2. Where a component is subjected to a combination of co-existent stresses, F_c is the combined stress which is to be calculated as follows: Combined bending and tension $F_c = 1,25f_t + f_{bt}$ Combined bending and compression $F_c = f_c + f_{bc}$ Combined bending, tension and shear $F_c = \sqrt{(1,25f_t + f_{bt})^2 + 3f_q^2}$ Combined bending, compression and shear $F_c = \sqrt{(f_c + f_{bc})^2 + 3f_q^2}$

= where

f_t = is the calculated axial tensile stress

f_c = is the calculated axial compressive stress

f_{bt} = is the calculated maximum tensile stress due to bending about both principal axes

f_{bc} = is the calculated maximum compressive stress due to bending about both principal axes

f_q = is the calculated shear stress

Y = is the specified 0,2 per cent proof stress for the material

8.2.3 The following criteria are to be used for gearing design:

- Torque is to be based on the performance criteria specified in Pt 3, Ch 13, 8.1 Windlass design.
- The use of an equivalent torque, T_{eq} , for dynamic strength calculations is acceptable but the derivation is to be submitted to LR for consideration.
- The application factor for dynamic strength calculation, K_A , is to be 1,15.
- Calculations are to be based on 1500 hours of operation.
- The static torque is to be $1,5 \times T_n$ where T_n is the nominal torque.
- The minimum factors of safety for load capacity of spur and helical gears, as derived using ISO 6336 or a relevant National or International standard acceptable to LR, are to be 1,5 for bending stress and 0,6 for contact stress.

8.2.4 Keyways are to be designed to a relevant National or International standard acceptable to LR.

8.2.5 The maximum stress in brake components is not to exceed the permissible stress stated in Table 13.8.3 Permissible stress for design load cases.

8.3 Control arrangements

8.3.1 All control devices are to be capable of being controlled from readily accessible positions and protected against unintentional operation.

8.3.2 The maximum travel of the levers is not to exceed 600 mm if movable in one direction only, or 300 mm to either side from a central position if movable in both directions. They are to move toward the right when hauling and toward the left when paying out. Alternatively, they are to move backward when hauling and forward when paying out.

8.3.3 Wherever practical, the lever is to move in the direction of the intended movement.

8.3.4 For lever-operated brakes, the brake is to engage when the lever is pulled and disengage when the lever is pushed. The physical effort on the brake for the operator is not to exceed 160 N.

8.3.5 For pedal-operated brakes the maximum travel is not to exceed 250 mm and the physical effort for the operator is not to exceed 320 N.

8.3.6 The handwheel or crankhandle is to actuate the brake when turned clockwise and release it when turned counterclockwise. The physical effort for the operator is not to exceed 250 N for speed regulation and 500 N at any moment.

8.3.7 When not provided with automatic sequential control, separate push-buttons are to be provided for each direction of operation.

8.3.8 The push-buttons are to actuate the machinery when depressed and stop and effectively brake the machinery when released.

8.3.9 The above mentioned individual push-buttons may be replaced by two 'start' and 'stop' push-buttons.

8.3.10 Control systems, whether electric, pneumatic or hydraulic, are to comply with the general requirements of Pt 6, Ch 1, 2 Essential features for control, alarm and safety systems.

8.4 Maintenance arrangements

8.4.1 Access is to be provided for inspection of reduction gears, bearings, brakes, etc.

8.4.2 Accessible manual lubrication points, including nipples, are to be provided for both for oil and grease, as applicable.

8.4.3 Gear-boxes are to be provided with adequate access arrangements for monitoring and replacing oil.

8.5 Protection arrangements

8.5.1 Where applicable, moving parts of windlass machinery are to be provided with suitable railings and/or guards to prevent injury to personnel.

8.5.2 Protection is to be provided for preventing persons from coming into contact with surfaces having temperatures over 50°C.

8.5.3 Steel surfaces not protected by lubricant are to be protected by a coating in accordance with the requirements of a relevant National or International Standard acceptable to LR.

8.5.4 For arrangements of power transmission systems and relief requirements see Pt 5, Ch 14, 14.1 General.

8.6 Marking and identification

8.6.1 Controls are to be permanently marked for identification, unless their functions are readily apparent. If required, instructions are to be permanently marked and readily visible.

8.7 Testing and acceptance

8.7.1 During trials on board ship, the windlass is to be shown to be capable of:

- (a) for all specified design anchorage depths: raising the anchor from a depth of 82,5 m to a depth of 27,5 m at a mean speed of 9 m/min; and
- (b) for specified design anchorage depths greater than 82,5 m: in addition to (a), raising the anchor from the specified design anchorage depth to a depth of 82,5 m at a mean speed of 3 m/min.

Where the depth of water in the trial area is inadequate, suitable equivalent simulating conditions will be considered as an alternative. Following trials, the ship will be eligible to be assigned a descriptive note **specified design anchorage depth . . . metres**, which will be entered in column 6 of the *Register Book*.

8.7.2 Windlass performance characteristics specified in Pt 3, Ch 13, 8.1 Windlass design and Pt 3, Ch 13, 8.7 Testing and acceptance are based on the following assumptions:

- (a) one cable lifter only is connected to the drive shaft;
- (b) continuous duty and short term pulls are measured at the cable lifter;
- (c) brake tests are carried out with the brakes fully applied and the cable lifter declutched;
- (d) the probability of declutching a cable lifter from the motor with its brake in the off position is minimised;
- (e) hawse pipe efficiency assumed to be 70 per cent.

8.8 Winch design and testing

8.8.1 A winch of sufficient power and suitable for the size of wire rope and chain cable is to be fitted to the ship. Where owners require equipment significantly in excess of Rule requirements, it is their responsibility to specify increased winching power.

8.8.2 The requirements of Pt 3, Ch 13, 8.1 Windlass design, Pt 3, Ch 13, 8.2 Calculations and Pt 3, Ch 13, 8.7 Testing and acceptance respectively are to be applied as performance criteria for winches assuming an equivalent U2 Grade chain cable diameter and Rule length for the same equipment letter. When applying the requirements of Pt 3, Ch 13, 8.1 Windlass design the factor K_b is to be taken as specified for when a chain stopper is not fitted.

8.9 Testing of equipment

8.9.1 All anchors and chain cables are to be tested at establishments and on machines recognised by the Committee and under the supervision of LR's Surveyors or other Officers recognised by the Committee, and in accordance with Ch 10 Equipment for Mooring and Anchoring of the Rules for Materials.

8.9.2 Test certificates showing particulars of weights of anchors, or size and weight of cable and of the test loads applied are to be furnished. These certificates are to be examined by the Surveyors when the anchors and cables are placed on board the ship.

8.9.3 Steel wire and fibre ropes are to be tested as required by Ch 10 Equipment for Mooring and Anchoring of the Rules for Materials.

8.9.4 For holding power testing requirements relating to high holding power anchors, see Ch 10, 1.7 Super high holding power (SHHP) anchors of the Rules for Materials.

8.10 Structural requirements associated with anchoring

8.10.1 The windlass or winch is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass or winch is to be increased, and adequate stiffening is to be provided, to the Surveyor's satisfaction. The structural design integrity of the bedplate is the responsibility of the Shipbuilder and windlass or winch manufacturer.

8.10.2 An easy lead of the cables from the windlass to the anchors and chain lockers is to be arranged. Where cables pass over or through stoppers, these stoppers are to be manufactured from ductile material and be designed to minimise the probability of damage to, or snagging of, the cable. They are to be capable of withstanding without permanent deformation a load equal to 80 per cent of the Rule breaking load of the cable passing over them.

8.10.3 Hawse pipes and anchor pockets are to be of ample thickness and of a suitable size and form to house the anchors efficiently, preventing, as much as practicable, slackening of the cable or movements of the anchor being caused by wave action. The shell plating and framing in way of the hawse pipes are to be reinforced as necessary. Reinforcing is also to be arranged in way of those parts of bulbous bows liable to be damaged by anchors or cables. Substantial chafing lips are to be provided at shell and deck. These are to have sufficiently large, radiused faces to minimise the probability of cable links being subjected to high bending stresses. Alternatively, roller fairleads of suitable design may be fitted. Where unpocketed rollers are used, it is recommended that the roller diameter be not less than eleven times the chain diameter. Where hawse pipes are not fitted, alternative arrangements will be specially considered.

8.10.4 The chain locker is to be of a capacity and depth adequate to provide an easy direct lead for the cable into the chain pipes, when the cable is fully stowed. Chain or spurling pipes are to be of suitable size and provided with chafing lips. The port and starboard cables are to be separated by a division in the locker.

8.10.5 Where means of access is provided to the chain locker it is to be closed by a substantial cover and secured by closely spaced bolts. Where a means of access to spurling pipes or cable lockers is located below the weather deck, the access cover and its securing arrangements are to be in accordance with ISO 5894-1999, or an equivalent National Standard acceptable to LR, recognised standards or equivalent for watertight manhole covers. Butterfly nuts and/or hinged bolts are prohibited as the securing mechanism for the access cover.

8.10.6 Chain lockers and spurling pipes are to be watertight up to the exposed weather deck and the space is to be efficiently drained. However, bulkheads between separate chain lockers, or which form a common boundary of chain lockers, need not be watertight.

8.10.7 Spurling pipes are to be provided with permanently attached closing appliances to minimise water ingress. Examples of acceptable arrangements are:

- (a) steel plates with cutouts to accommodate chain links, or
- (b) canvas hoods with a lashing arrangement that maintains the cover in the secured position.

8.10.8 Provision is to be made for securing the inboard ends of the cables to the structure. This attachment should have a working strength of not less than 63,7 kN (6,5 tonne-f) or 10 per cent of the breaking strength of the chain cable, whichever is the greater, and the structure to which it is attached is to be adequate for this load. Attention is drawn to the advantages of arranging that the cable may be slipped from an accessible position outside the chain cable locker. The proposed arrangement for slipping the chain cable, if constructed outside the chain locker, must be made watertight.

8.10.9 Satisfactory arrangements are to be made for the stowage and working of the stream anchor, if provided.

8.10.10 On dredging and reclamation craft the following are to be complied with:

- (a) On unpowered ships, the windlass may be hand operated.
- (b) On split type vessels, the arrangements are to be such that jamming of the anchor cable during opening and closing operations of the hull will not occur.

8.10.11 When wire rope instead of chain is used for the anchor cable, it is to be stored on a suitably designed drum or reel. Fairleads intended for use with wire rope cable are to be designed to minimise wear and to avoid kinking or other damage occurring to the rope. Fairleads should, in general, be fitted with rollers having a diameter not less than eleven times the diameter of the anchor cable or as specified/ recommended by the rope manufacturer.

8.11 Structural requirements for windlasses on exposed fore decks

8.11.1 Windlasses located on the exposed deck over the forward 0,25L of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0,1L or 22 m above the summer load waterline, whichever is the lesser, are to comply with the following requirements. Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.

8.11.2 The following pressures and associated areas are to be applied, see Figure 13.8.1 Windlass loading:

- 200 kN/m² normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction;
- 150 kN/m² parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of f times the projected area in this direction;

where

$$f = 1 + B/H, \text{ but not greater than } 2,5$$

B = width of windlass measured parallel to the shaft axis, in metres

H = overall height of windlass, in metres.

8.11.3 Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by N bolt groups, each containing one or more bolts, see Figure 13.8.2 Direction of forces and weight.

8.11.4 The axial force R_i in bolt group (or bolt) i , positive in tension, may be calculated from:

$$R_{xi} = P_x h x_i A_i / I_x \text{ in kN}$$

$$R_{yi} = P_y h y_i A_i / I_y \text{ in kN, and}$$

$$R_i = R_{xi} + R_{yi} - R_{si} \text{ in kN}$$

where

P_x = force acting normal to the shaft axis, in kN

P_y = force acting parallel to the shaft axis, either inboard or outboard whichever gives the greater force in bolt group i , in kN

h = shaft height above the windlass mounting, in cm

x_i, y_i = x and y coordinates of bolt group i from the centroid of all N bolt groups, positive in the direction opposite to that of the applied force, in cm

A_i = cross sectional area of all bolts in group i , in cm^2

$I_x = \sum A_i x_i^2$ for N bolt groups, in cm^4

$I_y = \sum A_i y_i^2$ for N bolt groups, in cm^4

R_{si} = static reaction at bolt group i , due to weight of windlass, in kN.

8.11.5 Shear forces F_{xi} , F_{yi} applied to the bolt group i , and the resultant combined force F_i may be calculated from:

$$F_{xi} = (P_x - \alpha g M)/N \text{ in kN}$$

$$F_{yi} = (P_y - \alpha g M)/N \text{ in kN}$$

and

$$F_i = \sqrt{(F_{xi}^2 + F_{yi}^2)} \text{ kN}$$

where

α = coefficient of friction (0,5)

M = mass of windlass, in tonnes

g = gravity acceleration (9,81 m/sec^2)

N = number of bolt groups.

8.11.6 Tensile axial stresses in the individual bolts in each bolt group i are to be calculated. The horizontal forces F_{xi} and F_{yi} are normally to be reacted by shear chocks. Where 'fitted' bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses in the individual bolts are to be calculated, and compared to the stress under proof load. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations.

8.11.7 The safety factor against bolt proof strength is to be not less than 2,0.

8.11.8 Bolts are to be of ISO 898/1 material Grade 8.8, 10.9 or 12.9 or equivalent and are to be pretensioned by controlled means to 70 to 90 per cent of their yield stress. Pretensioning is to be in accordance with the manufacturer's instructions and, in general, pretensioning by bolt torquing up to bolt size M30 may be used. Beyond this, pretensioning is to be carried out by an hydraulic tensioning device and the elongation of the bolts measured to determine pre-load. Where resin chocks are proposed plans and calculations are to be submitted for consideration.

8.11.9 The windlass is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass is to be increased. Adequate stiffening of the deck in way of the windlass is to be provided. The scantlings of the supporting structure and deck are to be determined by additional calculations applying the weight of the windlass combined with the resultant force on the seat due to the application of the following design loads:

- P_x (as defined in Pt 3, Ch 13, 8.11 Structural requirements for windlasses on exposed fore decks);
- P_y ;
- P_x and P_y combined;
- a load no less than the maximum pull developed by the windlass under normal operating conditions;
- a load no less than the ultimate breaking strength of the chain stopper, but need not be taken greater than the maximum brake holding capacity of the windlass. Requirements for chain stoppers are described in Pt 3, Ch 13, 9 Mooring of ships at single point moorings 9.

The allowable stresses given in Table 13.8.4 Allowable stress in windlass supporting structure are not to be exceeded.

Table 13.8.4: Allowable stress in windlass supporting structure

	Bending stress, in N/mm ²	Shear stress, in N/mm ²	Combined stress, in N/mm ²
Allowable stress	$\frac{150}{k}$	$\frac{87}{k}$	$\frac{213}{k}$
$k =$	material factor, see Pt 3, Ch 2, 1.2 Steel		

8.11.10 The axial tensile and compressive forces in Pt 3, Ch 13, 8.11 Structural requirements for windlasses on exposed fore decks and the lateral forces in Pt 3, Ch 13, 8.11 Structural requirements for windlasses on exposed fore decks are also to be considered in the design of the supporting structure.

8.12 Structural requirements associated with towing and mooring

8.12.1 The following requirements are applicable to bollards and bitts, fairleads, stand rollers and chocks used for the normal mooring and towing of the vessel, the supporting structure and their attachment to it. They are also applicable to the supporting structure of capstans, winches and similar items used for the normal mooring and towing of the vessel. Any weld, bolt or equivalent device connecting the shipboard fitting to the supporting structure is part of the shipboard fitting and is subject to the National or International standard applicable to that shipboard fitting.

8.12.2 The design criteria in this sub-Section are to be used to derive the net scantlings of the supporting structure. A corrosion addition of 2 mm is to be added to the net thickness derived.

8.12.3 Shipboard fittings for towing or mooring are to be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the load. Other arrangements will be specially considered provided that the strength is confirmed as adequate for the service.

8.12.4 The design load applied to shipboard fittings and supporting hull structure is not to be less than that given in Table 13.8.5 Minimum design load for deck fittings and supporting structure.

Table 13.8.5: Minimum design load for deck fittings and supporting structure

Use/Item	Minimum design load ⁽¹⁾
Normal towing (harbour/manoeuvring)	1,25 times the intended maximum towing load as indicated on the towing and mooring arrangements plan
Escort towing	minimum breaking strength of the towline given in Table 13.7.3 Equipment - Stream anchors, stream wires, towlines and mooring lines for the ship's corresponding equipment number ⁽²⁾
Mooring	1,25 times the breaking strength of the mooring line given in Table 13.7.3 Equipment - Stream anchors, stream wires, towlines and mooring lines for the ship's corresponding equipment number ⁽²⁾⁽³⁾
Winches, etc.	1,25 times the intended maximum brake holding power

Capstans	1,25 times the maximum hauling in force
<p>Note 1. If a greater design load is specified by the designer then this load is to be used.</p> <p>Note 2. The equipment number calculation is to include the maximum projected area of all deck cargo.</p> <p>Note 3. Note 7 in Table 13.7.3 Equipment - Stream anchors, stream wires, towlines and mooring lines is applicable.</p>	

8.12.5 The design load is to be applied according to the arrangement shown on the towing and mooring arrangement plan. The point of action of the force on the fitting is to be taken as the point of attachment of the mooring line or towline or at a change in its direction. The total design load applied to a fitting need not be more than twice the design load, see Figure 13.8.3 Design load applied to fittings.

Figure 13.8.3: Design load applied to fittings

8.12.6 The selection of shipboard fittings is to be made by the shipyard in accordance with an acceptable National or International standard (e.g. ISO13795 Ships and marine technology – Ship's mooring and towing fittings – Welded steel bollards for sea-going vessels). If the shipboard fitting is not selected from an acceptable National or International Standard then the design load used to assess its strength and its attachment to the ship is to be in accordance with the design load given in Table 13.8.5 Minimum design load for deck fittings and supporting structure and the design is to be submitted for approval.

8.12.7 The reinforced members beneath shipboard fittings are to be effectively arranged for any variation of the direction, in both the lateral and vertical plane, of the forces acting through the arrangement.

8.12.8 The stress within the supporting structure of fittings is not to exceed that given in Table 13.8.6 Allowable stress within the supporting structure of shipboard fittings.

Table 13.8.6: Allowable stress within the supporting structure of shipboard fittings

	Normal stress, in N/mm ²	Shear stress, in N/mm ²
Allowable stress	$\frac{235}{k}$	$\frac{141}{k}$
<p>where</p> $k = \frac{235}{\sigma_0}$ <p>σ_0 = specified minimum yield strength of the material in N/mm²</p>		

8.12.9 The Safe Working Load (SWL) of a shipboard fitting used for normal towing and mooring is not to be greater than 80 per cent of the design load. The SWL of a shipboard fitting used for escort towing is not to be greater than the design load. For fittings used for both operations, the greater design load is to be used.

8.12.10 The SWL of each shipboard fitting is to be marked, by weld bead or equivalent, on the fitting and relates to a single post basis.

8.12.11 When determining the minimum design load for deck fitting and supporting structure the 'Mooring Equipment Number' is to be calculated as follows:

$$\text{Mooring Equipment Number} = \Delta^{2/3} + 2BH + \frac{A}{10}$$

where

A = area, in m², in profile view of the hull including the projected area of all deck cargo, within the Rule length of the vessel, and of superstructures and houses above the summer load waterline, which are within the Rule length of the vessel, and also having a breadth greater than $\frac{B}{4}$

= See also Pt 3, Ch 13, 8.12 Structural requirements associated with towing and mooring and Pt 3, Ch 13, 8.12 Structural requirements associated with towing and mooring

B = greatest moulded breadth, in metres

H = freeboard amidships, in metres, from the summer load waterline to the upper deck, plus the sum of the heights at the centreline, in metres, of each tier of houses having a breadth greater than $\frac{B}{4}$

= See also Pt 3, Ch 13, 8.12 Structural requirements associated with towing and mooring, Pt 3, Ch 13, 8.12 Structural requirements associated with towing and mooring and Pt 3, Ch 13, 8.12 Structural requirements associated with towing and mooring

Δ = moulded displacement, in tonnes, to the summer load waterline.

8.12.12 In the calculation of H and A , sheer and trim are to be ignored. Where there is a local discontinuity in the upper deck, H is to be measured from a notional deckline.

8.12.13 If a house having a breadth greater than $\frac{B}{4}$ is above a house with a breadth of $\frac{B}{4}$ or less, then the wide house is to be included, but the narrow house ignored.

8.12.14 Screens and bulwarks more than 1,5 m in height are to be regarded as parts of houses when determining H and A . Where a screen or bulwark is of varying height, the portion to be included is to be that length, the height of which exceeds 1,5 m.

■ Section 9

Mooring of ships at single point moorings

9.1 General

9.1.1 These requirements are applicable to ships intended to utilise the fittings standardised for single point moorings and include the type, strength and location of the required fittings.

9.1.2 A ship provided with mooring arrangements in accordance with the requirements of this Section will be eligible to be assigned the Class notation **SPM4** where a single mooring line arrangement is provided for and **DSPM4** where a dual mooring line arrangement is provided for, see Figure 13.9.1 Positioning of fairleads, chainstoppers and pedestal roller leads.

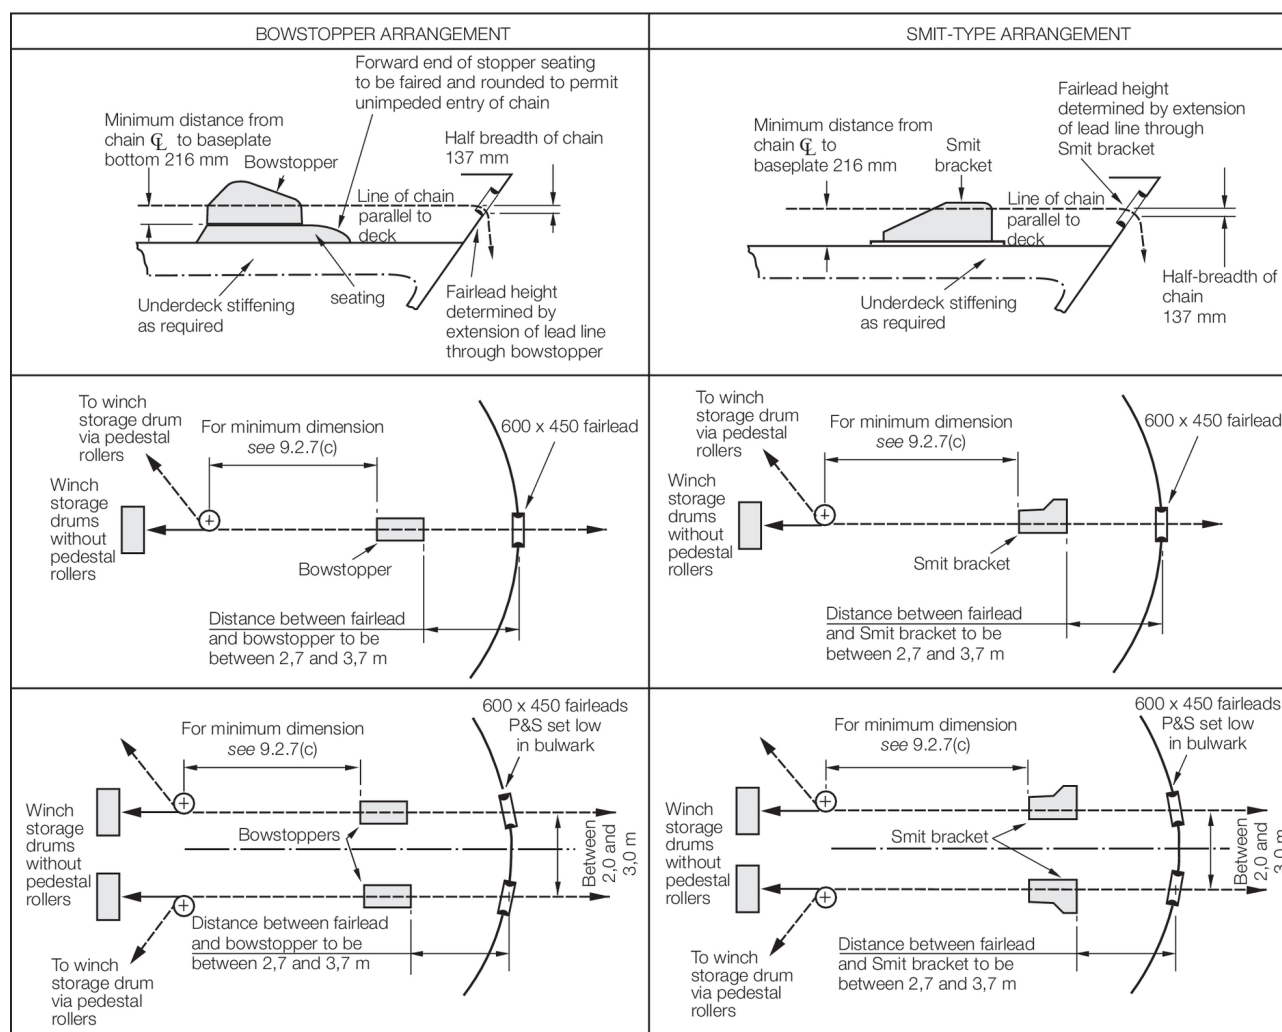

Figure 13.9.1: Positioning of fairleads, chainstoppers and pedestal roller leads

9.2 Arrangements

9.2.1 The ship is to be fitted with bow chain stoppers and/or Smit-Type Brackets, and bow fairleads. In addition, pedestal roller fairleads may be required for alignment purposes but a direct straight lead from the chain stopper to the winch storage drum is the preferred arrangement. However, consideration of safety and protection from risk of injury to mooring personnel should take priority in determining whether pedestal rollers should be fitted as well as their number and positioning.

9.2.2 In order to ensure matching with terminal mooring equipment, the requirements for shipboard fittings are specified in association with ranges of ship deadweight as shown in Table 13.9.1 Deadweight group for shipboard fittings requirements.

Table 13.9.1: Deadweight group for shipboard fittings requirements

Group	Deadweight in tonnes	
I	$\leq 100\,000$	
II	$> 100\,000$	$\leq 150\,000$
III	$> 150\,000$	

9.2.3 Bow chain stoppers:

- (a) The number, chain cable size and minimum safe working load of bow chain stoppers should be as given in Table 13.9.2 Fittings requirements for deadweight group.
- (b) Bow chain stoppers should be located between 2,7 m and 3,7 m aft of the bow fairlead and should be positioned so as to give correct alignment with the bow fairlead and the pedestal fairlead or the storage drum of the winch, see Figure 13.9.1 Positioning of fairleads, chainstoppers and pedestal roller leads.
- (c) The leading edge of the stopper base plate is to be suitably faired to allow unimpeded entry of the combination chafe chain into the stopper. The chain referred to, forms part of the standardised SPM equipment.
- (d) The safety factor on yield of bow chain stoppers should be a minimum of 2 when the safe working load is applied.
- (e) Details of bow chain stoppers should be submitted for approval.

Table 13.9.2: Fittings requirements for deadweight group

Group	Chain size, in mm	No. of chain stoppers	SWL, in kN (tonnes)
I	76	1, see Note	1960 (200)
II	76	1, see Note	2450 (250)
III	76	2	3430 (350)

Note Ships in this size range may elect to fit two stoppers to ensure full range terminal acceptance, see Pt 3, Ch 13, 9.1 General.

9.2.4 Smit-Type Brackets:

- (a) Smit-Type Brackets may be fitted in lieu of bow chain stoppers for Group I and II. The fitting of Smit-Type Brackets in lieu of bow chain stoppers for Group III will be specially considered. The required number and safe working load are as given in Table 13.9.2 Fittings requirements for deadweight group for bow chain stoppers.
- (b) The scantlings of the pin, connecting brackets and welded attachments to the baseplate are to be determined in association with a horizontal load of 2 x SWL and a permissible shear stress of 78 N/mm² (8 kg/mm²).
- (c) Where fitted, Smit-Type Brackets should be located between 2,7 m and 3,7 m aft of the bow fairlead and should be positioned so as to give correct alignment with the bow fairlead and pedestal fairlead or the storage drum of the winch, see Figure 13.9.1 Positioning of fairleads, chainstoppers and pedestal roller leads.
- (d) To facilitate connection to the terminal equipment it is recommended that each Smit-Type Bracket be provided with a length of chain cable comprising a pear link, an open link, and a special shackle, see Figure 13.9.2 Special shackle Dimensions in mm unless otherwise stated. The safe working load should be as given in Table 13.9.2 Fittings requirements for deadweight group for bow stoppers.
- (e) Adjacent to each Smit-Type Bracket a lug with a recommended safe working load of 490 kN (50 tonnes) should be attached to the doubler plate. The lug should be provided with a hole of sufficient size to accept the pin of a 490 kN (50 tonnes) SWL shackle and should be used as a securing point for the chafe chain holding stopper.
- (f) Details of Smit-Type Brackets should be submitted for approval.

9.2.5 The forecastle deck in way of bow chain stoppers or Smit-Type Brackets is to have a minimum thickness of 15 mm and is to be suitably reinforced to resist horizontal loads equal to 2 x SWL as given in Table 13.9.2 Fittings requirements for deadweight group.

9.2.6 Bow fairleads:

- (a) One centrally located bow fairlead should be provided for ships fitted with one bow chain stopper or Smit-Type bracket. Two bow fairleads should be provided for ships fitted with two bow chain stoppers or Smit-Type brackets, see Figure 13.9.1 Positioning of fairleads, chainstoppers and pedestal roller leads.
- (b) Bow fairlead openings should be at least 600 x 450 mm for 76 mm chafe chain size. Where more than one bow fairlead is installed, the spacing of centres should be between 2 m and 3 m.
- (c) The height of the centre of the bow fairlead opening above the forecastle deck should be determined by the extension, parallel to the deck, of the lead line of the chain cable to the bow chain stopper or Smit-Type Bracket, see Figure 13.9.1 Positioning of fairleads, chainstoppers and pedestal roller leads. The fairlead should have a minimum radius equal to seven times the chain radius.

- (d) The scantlings of the fairlead are to be determined in association with a load of $2 \times \text{SWL}$ with hawser angles up to 90 degrees from the ship's centre line, both port and starboard in the horizontal plane and to 30 degrees above and below horizontal in the vertical plane.
- (e) Details of bow fairleads and their attachment to the bulwark should be submitted for approval.

9.2.7 Pedestal roller fairleads:

- (a) Pedestal roller fairleads should have a minimum radius equal to 10 times the radius of wire mooring ropes with a fibre core, seven times the radius of wire mooring ropes with a steel core or three times the radius of synthetic mooring ropes.
- (b) The number of pedestal roller fairleads used for each bow chain stopper should not exceed two and the angle subtended by the change of direction of the pick-up rope should be minimal.
- (c) The minimum distance of pedestal roller fairleads from the bow chain stopper or Smit-Type Bracket should be 3,0 m. Any variation in the minimum distance will be specially considered.
- (d) Details of local strengthening of the forecastle deck in way of pedestal roller fairleads should be submitted for approval.

Figure 13.9.2: Special shackle
Dimensions in mm unless otherwise stated

9.2.8 The winch drum used for handling the mooring gear should be capable of exerting a continuous duty pull of not less than 147 kN (15 tonnes) and be of sufficient size to accommodate 150 m of 80 mm diameter rope. Winch drum ends (warping ends) to handle pick-up ropes should be avoided. Remotely-operated winch storage drums are recommended.

■ *Section 10***Emergency towing arrangements****10.1 Structural requirements**

10.1.1 For ships equipped with emergency towing arrangements in accordance with IMO Resolution MSC 35(63), the deck and its supporting structure in way of strongpoints and fairleads are to be suitably reinforced to resist design loads of at least 1,3 x specified breaking strength of the weakest component of the emergency towing arrangement, for angles of tow as specified in IMO Resolution MSC 35(63). The deck in way of strongpoints and fairleads is to have a minimum thickness of 15 mm.

10.1.2 Where a ship is provided with an emergency towing arrangement and the supporting structure complies with the requirements of this Section, the ship will be eligible to be assigned the descriptive note **ETA** which will be entered in column 6 of the *Register Book*.

10.1.3 Stresses induced in the supporting structure and welds in way of strongpoints and fairleads, determined using the design loads from Pt 3, Ch 13, 10.1 Structural requirements, are not to exceed the permissible values given in Table 13.10.1 Permissible stress values. The capability of the structure to withstand buckling is also to be assessed.

Table 13.10.1: Permissible stress values

	Permissible stress N/mm ² (kgf/mm ²)
Direct stress	σ_0
Shear stress	$\frac{\sigma_0}{\sqrt{3}}$
Combined stress	σ_0
Symbols	
σ_0 = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

10.1.4 The structural arrangement is to be such that continuity will be ensured. Abrupt changes of shape or section, sharp corners and other points of stress concentration are to be avoided.

10.2 Chafing chain and wire or fibre rope for Emergency Towing Arrangements

10.2.1 Chafing chains are to be manufactured, tested and certified in accordance with Ch 10, 2 Stud link chain cables for ships of the Rules for Materials Grades U2 and U3.

10.2.2 The outboard end of the chafing chain is to include a pear-shaped link allowing connection to a shackle corresponding to the type of ETA and chain grade. A typical arrangement is shown in Figure 13.10.1 Typical outboard chafing chain end.

10.2.3 The chafing chain is to be able to withstand a breaking load not less than twice the safe working load (SWL). The nominal diameter of common link for chafing chains is to comply with the value indicated in Table 13.10.2 Nominal diameter of common link for chafing chains for ETA.

Table 13.10.2: Nominal diameter of common link for chafing chains for ETA

Type of ETA	Nominal diameter of common link, d min	
	Grade U2	Grade U3
ETA 1000	62 mm	52 mm
ETA 2000	90 mm	76 mm

10.2.4 Steel wire ropes are to be manufactured, tested and certified in accordance with Ch 10, 6 Steel wire ropes of the Rules for Materials.

10.2.5 Fibre ropes are to be manufactured, tested and certified in accordance with Ch 10, 7 Fibre ropes of the Rules for Materials.

■ *Section 1* **General**

1.1 Application

1.1.1 All cargo ships, regardless of tonnage, except those engaged solely in the carriage of either liquid or solid bulk cargoes, are to be provided with a Cargo Securing Manual approved by the Flag Administration, as required by SOLAS 1974 (as amended). Pt 3, Ch 13, 2 Rudders 2, Pt 3, Ch 13, 4 Steering gear and allied systems, Pt 3, Ch 13, 7 Equipment (if applicable) and Pt 3, Ch 13, 10 Emergency towing arrangements apply to all ships for which a Cargo Securing Manual is required. It is recommended that the container securing arrangements in the Cargo Securing Manual be designed in accordance with Pt 3, Ch 13, 3 Fixed and steering nozzles, Pt 3, Ch 13, 5 Bow and stern thrust unit structure, Pt 3, Ch 13, 6 Stabiliser structure, Pt 3, Ch 13, 8 Windlass design and testing and Pt 3, Ch 13, 9 Mooring of ships at single point moorings. Furthermore, it is recommended that the container securing arrangements be submitted to Lloyd's Register (hereinafter referred to as LR), for formal approval. In cases where LR is authorised to carry out the approval of the Cargo Securing Manual on behalf of a National Administration and the container securing arrangements have not been designed on the basis of the LR Rules nor received formal LR approval, the Cargo Securing Manual will be annotated accordingly, highlighting this fact. In general, Cargo Securing Manuals can be approved by LR if authorised by the National Authority.

1.1.2 Fixed fittings which are part of the container lashing equipment or which may affect the strength of the ship's hull are subject to approval on the basis of the requirements of this Chapter. Details of the connection and the supporting ship structure require approval to satisfy the design loads determined in accordance with Pt 3, Ch 14, 8 Determination of forces for container securing arrangements or the safe working load of the fixed fitting, as applicable. Drawings are to be submitted showing details of the fittings, the attachment, the local foundations and information about the intended materials and welding.

1.1.3 The requirements for container securing arrangements have been framed in relation to ISO Standard Series 1 ISO 1496-1:1990, including Amendment Nos. 1, 2 and 3, Freight Containers. For previous ISO 1496-1:1984 containers, reference should be made to the July 2008 LR Rules. Proposals to consider higher allowable forces in accordance with ISO 1496-1, including Amendment No. 4, 2006, will be specially considered. Proposals for the securing of other types of containers will be specially considered.

1.1.4 Containers are to be loaded so as not to exceed the weights and distribution within the stack according to the Cargo Securing Manual (CSM). The permissible loading patterns are to be clearly indicated on the Container Securing Arrangement Plan carried on board the ship.

1.1.5 Containers may be approved and certified using LR's *Container Certification Scheme*.

1.1.6 Where it is intended and specified that loose or fixed parts of the container securing system are used for lifting appliance purposes, e.g. pedestal sockets and fittings used for lifting of hatch covers, or twistlocks used for vertical tandem lifting, the

requirements of LR's Code for Lifting Appliances in a Marine Environment are applicable. If no approval from lifting aspects is sought, the devices will be considered as part of a container securing arrangement only.

1.1.7 For ships having the class notation **Container Ship**, an effective breakwater is to be fitted to protect the containers against green sea impact loads. As a minimum, an effective breakwater is to extend above the mid-height of the outermost containers that are to be considered as protected. For other ships which are equipped for the carriage of containers on deck, protection of the cargo is recommended by the provision of a breakwater.

1.1.8 Forward of 0,75L, it is recommended that all door ends face aft in order to improve the performance of the container walls to withstand green sea loads.

1.1.9 Improper ship handling related to course and speed or threshold phenomena like parametric rolling can create adverse forces acting on the ship and the cargo which are in excess of the forces determined on the basis of Section Pt 3, Ch 14, 8 Determination of forces for container securing arrangements. It is the responsibility of the Master to apply good seamanship in order to mitigate excessive ship motions to reduce forces acting on the cargo stowage arrangements.

1.2 Classification notations and descriptive notes

1.2.1 Ships with container securing arrangements which are designed and constructed in accordance with this Chapter will be eligible to be assigned the special features notation **CCSA** (certified container securing arrangements). In addition to the fixed fittings, the Initial and Periodical Survey requirements of Section Pt 3, Ch 14, 10 Surveys for all loose fittings are applicable. Where loose container securing fittings are supplied for part container stowage only, the special features notation will be suitably modified.

1.2.2 Ships with container securing arrangements which are designed and constructed in accordance with this Chapter, but where the Initial and Periodical Survey requirements for loose fittings in Section Pt 3, Ch 14, 10 Surveys are not requested, will be eligible to be assigned the descriptive note **CSA** (container securing arrangement) and for an entry to be made in column 6 of the *Register Book*.

1.2.3 The advantage of having an onboard lashing program to calculate forces acting on the stowage arrangement is highlighted. It is recommended that all ships carrying containers on a regular basis be equipped with such a tool. This may be an extension to the loading instrument covered under Pt 3, Ch 4, 8.3 Loading instrument. It is recommended that the program be approved by LR. If the program to carry out lashing calculations is approved by LR and installed and maintained in accordance with the requirements of this Chapter, the ship will be eligible to be assigned the special features notation **BoxMax**.

1.2.4 It is a prerequisite for assignment of the special features notation **BoxMax** that the container securing arrangements in the Cargo Securing Manual are designed in accordance with this Chapter and submitted to Lloyd's Register for formal approval.

1.2.5 The container securing arrangements of a container ship may take into account specific voyage routes and seasons, provided the ship is eligible for the special features notation **BoxMax**, see Pt 3, Ch 14, 1.2 Classification notations and descriptive notes, the onboard lashing program is capable of performing calculations specific to defined sea areas and seasons and the weather-dependent factors for these areas and seasons have been supplied by LR. In this case, if the weather-dependent factors have been supplied by LR for specific sea areas, the ship will be eligible to be assigned the special features notation **BoxMax(V)**. If the factors have been supplied by LR for specific sea areas and seasons, the ship will be eligible to be assigned the special features notation **BoxMax(V,W)**. See Pt 3, Ch 4, 8.3 Loading instrument.

1.2.6 A ship designed to carry containers that is provided with safe access and securing arrangements in accordance with the Provisional Rules and Regulations for Ergonomic Container Lashing will be eligible to be assigned the special features notation **ECL** (Ergonomic Container Lashing), with supplementary descriptor.

1.3 Plans and information required

1.3.1 For all fixed cargo securing arrangements, except container securing arrangements, the following information and plans are to be submitted:

- (a) Details of certification including safe working load (SWL) of fixed cargo securing fittings.
- (b) Plans of structure in way of fixed cargo securing fittings.
- (c) Direction of loads imposed on the ship's fixed cargo securing fittings.
- (d) A general arrangement of fixed cargo securing fittings.

1.3.2 For container securing arrangements, the following plans and information are to be submitted:

- (a) General arrangement plan showing the disposition and design weights of the containers.
- (b) Details of materials, design, scantlings of cell guides structure, lashing bridges, pedestals, and other container securing arrangements, where fitted.

- (c) Details of certification, including safe working load (SWL), of fixed and loose container securing fittings.
- (d) Plans of structure in way of fixed container securing fittings and arrangements.
- (e) Design values of the following ship parameters for the container load departure and arrival conditions:
- (i) Moulded draught (T_c)
 - (ii) Transverse metacentric height (GM).
- (f) Design wind speed (V_w).
- (g) The lashing calculations in the Cargo Securing Manual are to be based on two design GM values. The lower design value is to be taken as 2,5 per cent of the breadth B , and the upper design value is to be taken as 7,5 per cent of B . In addition to these two design GM values, actual GM values of the ship in the container loaded condition from the approved trim and stability booklet are to be included when the actual design GM values are outside the above range.

1.3.3 Where containers of types other than ISO containers are to be incorporated in the stowage arrangement, the Cargo Securing Manual is to indicate clearly the locations where these containers are stowed. The manual is also to indicate the container weights and required securing arrangements for stacks composed entirely of ISO Standard containers.

1.4 Securing systems

1.4.1 Containers are to be secured by one, or a combination, of the following systems:

- Corner locking devices.
- Rod, wire or chain lashings.
- Buttresses, shores or equivalent structural restraint.
- Cell guides.

Alternative systems will be considered on the basis of their suitability for the intended purpose.

1.4.2 Dunnage is not to be used in association with approved container securing systems except where forming part of an approved line load stowage, see Pt 3, Ch 14, 5.5 Line Load stowage.

1.5 Symbols and definitions

1.5.1 The following definitions are applicable to this Chapter, except where otherwise stated:

a = breadth of the container, in metres (for longitudinally stowed containers)

b = length of the container, in metres (for longitudinally stowed containers)

c_i = height of container i , in metres

d_i = flange thickness of container securing device (e.g. twistlock) below container i , in metres

a_0 = acceleration parameter

$$= f_{HS} \left(1,58 - 0,47C_b \right) \left(\frac{2,4}{\sqrt{L}} + \frac{34}{L} + \frac{600}{L^2} \right)$$

a_{surge} = longitudinal acceleration due to surge, in m/s^2

$$= 0,275a_0 g$$

a_{sway} = transverse acceleration due to sway, in m/s^2

$$= 0,55a_0 g$$

a_{heave} = vertical acceleration due to heave, in m/s^2

$$= a_0 g$$

a_{roll} = roll acceleration at the centre of motion of the vessel, in rad/s^2

Cargo Securing Arrangements

Part 3, Chapter 14

Section 1

$$= 0,69 \frac{\varphi}{T_r^2}$$

a_{pitch} = acceleration due to pitch, in rad/s²

$$0,69 \left(1 + \frac{0,98}{\sqrt{L}} \right) \frac{\psi}{T_p^2}$$

T_p = period of pitch of the ship, in seconds, to be taken as specified in Table 14.8.1 Ship motions

T_r = period of roll of the ship, in seconds, to be taken as specified in Table 14.8.1 Ship motions

φ = maximum single amplitude of roll, in degrees, to be taken as specified in Table 14.8.1 Ship motions

Ψ = maximum single amplitude of pitch, in degrees, to be taken as specified in Table 14.8.1 Ship motions

e = base of natural logarithms

$$= 2,7183$$

f_{ap} = hull form coefficient

= for Motion Case MC1:

$$= 1,2 R_A^{0,3} \text{ for } R_A > 1,0$$

$$= 1,2 \text{ for } R_A \leq 1,0$$

= for all other Motion Cases:

$$= 1,0$$

R_A = area ratio factor for combined stern and bow shape, defined in Pt 4, Ch 2, 2.4 Design vertical wave bending moments. For the purpose of container stowage calculation, R_A is to be taken as 1,5 if this value is not available

f_{BK} = bilge keel coefficient

= 1,2 for ships without bilge keels

= 1,0 for ships with bilge keels

f_{Hs} = weather-dependent factor for acceleration

= 1,0 for unrestricted worldwide service

f_{HsP} = weather-dependent factor for pitch

= 1,0 for unrestricted worldwide service

f_{HsR} = weather-dependent factor for roll

= 1,0 for unrestricted worldwide service

f_{HsW} = weather-dependent factor for whipping acceleration

= 1,0 for unrestricted worldwide service

C_{p1} = hull whipping factor

$$= 1 + f_{MC} f_{wh} f_{HsW}$$

f_{MC} = Motion Case coefficient

$$= 1,0 f_{wl} \text{ for MC1}$$

$$= 0 \text{ for MC2}$$

$$= 0,5 f_{wl} \text{ for MC3}$$

$$= 0,25 f_{wl} \text{ for MC4}$$

$$= 0,5 f_{wl} \text{ for MC5}$$

$$= 0 \text{ for MC6}$$

f_{wh} = whipping coefficient

$$= 0,55 \text{ for } x_c/L \leq 0,25$$

$$= 0,20 \text{ at } x_c/L = 0,5$$

$$= 0,45 \text{ for } x_c/L \geq 0,75$$

intermediate values are to be obtained by linear interpolation

f_{wl} = length-dependent factor for whipping

$$= 0 \text{ for } L \leq 250 \text{ m}$$

$$= 1,0 \text{ for } L \geq 350 \text{ m}$$

intermediate values are to be obtained by linear interpolation

g = acceleration due to gravity and is to be taken as $9,81 \text{ m/s}^2$

x_c = longitudinal centre of gravity of a container forward of the AP, in metres

z_c = vertical centre of gravity of a container above the keel, in metres

x_i = longitudinal coordinate of the centre of container i , in metres, from O_m measured positive forwards in ship coordinate system, see Figure 14.1.1 Diagrammatic representation of symbols

$$= x_c - x_{om}$$

y_i = transverse coordinate of the centre of container i , in metres, from O_m measured positive to port in ship coordinate system, see Figure 14.1.1 Diagrammatic representation of symbols

z_i = vertical coordinate of the centre of container i , in metres, from O_m measured positive upwards in ship coordinate system, see Figure 14.1.1 Diagrammatic representation of symbols

$$= z_c - z_{om}$$

x_{om} = longitudinal centre of motion forward of the AP. To be taken at the LCF of the ship

z_{om} = vertical centre of motion above the keel. To be taken as the greater of $2T_c/3 + KG/3$, T_c or $D/2$

A = side area of the container, in m^2

GM = transverse metacentric height of the ship, in metres

KG = vertical distance of the centre of gravity of the ship above the keel, in metres

L = Rule length, in metres, see Pt 3, Ch 1, 6.1 Principal particulars

C_b = block coefficient, see Pt 3, Ch 1, 6.1 Principal particulars

MCn = Motion Case n

LCF = longitudinal centre of flotation. To be taken as $0,48L$

O_m = centre of motion, to be taken on the centreline at x_{om} and z_{om} , see Figure 14.1.1 Diagrammatic representation of symbols and Figure 14.1.2 Ship coordinate system and sign convention of motions

R = the rating, or maximum operating gross weight for which the container is certified, and is equal to the tare weight plus payload of the container, in tonnes

T_c = moulded draught in the container load condition, in metres

V_w = wind speed, in m/s. For ships with an unrestricted worldwide service area notation, a wind speed of 40 m/s is to be applied

W = weight of the container and contents, in tonnes. The following minimum weights W are to be used:

- = 2,5 tonnes for 20 ft containers
- = 3,5 tonnes for 40 ft containers
- = 4,0 tonnes for 45 ft containers
- = 4,5 tonnes for 48 ft and 53 ft containers.

Figure 14.1.1: Diagrammatic representation of symbols

**Figure 14.1.2: Ship coordinate system and sign convention of motions**

1.5.2 The sign convention for ship motions and accelerations is shown in Figure 14.1.2 Ship coordinate system and sign convention of motions. This is based on a right-handed coordinate system. The roll, pitch and yaw motions are defined positive clockwise as shown. For instance, positive sway is defined as the translation toward port and positive pitch as the rotation of the bow down and stern up.

■ Section 2

Fixed cargo securing fittings, materials and testing

2.1 General

2.1.1 Randomly selected samples of fixed cargo securing fittings are to be subjected to prototype testing and, upon satisfactory completion, will be granted General Approval.

2.1.2 Randomly selected samples drawn from production runs are to be subjected to production testing prior to delivery to the ship.

2.1.3 Cargo securing fittings, certified by an organisation other than LR, will be accepted where the certification scheme is to the satisfaction of LR.

2.2 Materials and design

2.2.1 Steel used for the construction of the fixed cargo securing fittings is to comply with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials) or with an equivalent specification acceptable to LR. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment. The chemical composition of the steel is to be such as to ensure acceptable qualities of weldability. Where necessary, tests are to be carried out to establish specific welding procedures.

2.2.2 Where securing arrangements are intended to operate at low ambient temperatures, special consideration is to be given to the specification of the steel.

2.2.3 Proposals for the use of materials other than steel will be specially considered.

2.2.4 Attention is drawn to the need for measures to be taken to prevent water accumulation in pockets or recesses that could lead to excessive corrosion.

2.3 Prototype testing

2.3.1 Prototype tests to determine the breaking or failure loads are to be carried out on at least two randomly selected samples of each item used in the securing system. The relationship between design breaking load and safe working load (SWL) is to be as indicated in Table 14.2.1 Design breaking loads and proof loads for fixed cargo securing fittings.

Cargo Securing Arrangements

Part 3, Chapter 14

Section 2

Table 14.2.1: Design breaking loads and proof loads for fixed cargo securing fittings

Minimum design breaking load		Minimum proof load	
for SWL ≤ 400 kN	for SWL > 400 kN	for SWL ≤ 400 kN	for SWL > 400 kN
2 x SWL	SWL + 400 kN	1,5 x SWL	SWL + 200 kN

Note Breaking and proof loads for fixed cargo securing fittings of a material other than steel will be specially considered.

2.3.2 The Surveyor is to be satisfied that the design and materials of the fittings are in accordance with the approved plans.

2.3.3 For acceptance, no permanent deformation (other than due to initial embedding of component parts) is to be induced by test loads up to the proof load given in Table 14.2.1 Design breaking loads and proof loads for fixed cargo securing fittings.

2.3.4 When considering the test modes, all expected directions of operation are to be taken into account. Jigs are to be employed, where necessary, in order that satisfactory simulation is obtained.

2.3.5 In the interest of standardisation of the strength of container securing fittings, safe working loads in accordance with Table 14.2.2 Test loads and test modes for fixed container securing fittings are recommended.

Table 14.2.2: Test loads and test modes for fixed container securing fittings

Item No.	Description	Required test modes		Recommended minimum, in kN		
				SWL	Proof load	Breaking load
1	Flush socket		Pull-out load	250	375	500
2	Pedestal socket		Pull-out load	250	375	500
			Tangential load	200	300	400
3	'D' ring		Tensile load	250	375	500
4	Lashing plate		Tensile load	250	375	500

Note 1. For items 3 and 4, where specifically designed for use with chain or steel wire rope (SWR) lashings, a lesser SWL may be considered.

Note 2. For items 1 and 2, where multiple flush sockets or pedestal sockets are involved, test loads are to be applied simultaneously to each socket opening which can be loaded simultaneously in service.

Note 3. For item 4, where multiple lashing points are fitted in one deck plate fitting, testing is to be similarly arranged as for Note 2.

Note 4. Where containers with strength higher than required for ISO containers are used, consideration will be given to the required minimum loads.

Note 5. The test modes illustrated above are diagrammatic only.

2.3.6 Where one of the required two randomly selected test samples fails before the design breaking load is reached, this can be accepted, provided that:

- (a) the failure is not less than 95 per cent of the design breaking load;
- (b) an additional randomly selected sample is tested satisfactorily; and
- (c) the average failure load of the three randomly selected samples is equal to or greater than the design breaking load.

2.4 Production testing

2.4.1 The nature and extent of proposed production testing will be considered by LR, but the arrangements are to be at least equivalent to one of the following testing procedures:

- (a) One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be proof loaded in accordance with Table 14.2.1 Design breaking loads and proof loads for fixed cargo securing fittings.
- (b) All fittings are to be loaded to the SWL of the item.

2.4.2 Consideration will be given to a reduced frequency of the mechanical production testing proposed in Pt 3, Ch 14, 2.4 Production testing, provided that:

- (a) the prototype test results indicate a breaking load at least 50 per cent greater than that required by Table 14.2.1 Design breaking loads and proof loads for fixed cargo securing fittings; and
- (b) a suitable non-destructive inspection procedure is agreed.

2.4.3 Permanent deformation (other than that due to initial embedding of component parts) will not be accepted unless tests are conducted in accordance with Pt 3, Ch 14, 2.4 Production testing and the SWL of the sample is 250 kN or greater. In this case, consideration may be given to acceptance of permanent deformation in the load range between SWL + 125 kN and the proof load, provided that satisfactory manual operation can be achieved after completion of tests.

2.4.4 In the event of premature failure or serious plastic deformation occurring in a test sample, a further randomly selected sample is to be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

■ *Section 3*

Loose container securing fittings, materials and testing

3.1 General

3.1.1 Randomly selected samples of loose container securing fittings are to be subjected to prototype testing and, upon satisfactory completion, will be granted General Approval.

3.1.2 Randomly selected samples drawn from production runs are to be subjected to production testing prior to delivery to the ship in accordance with Pt 3, Ch 14, 3.4 Production testing.

3.1.3 Loose container securing fittings, certified by an organisation other than LR, will be accepted where the certification scheme is to the satisfaction of LR.

3.1.4 In the following, the term 'fully automatic fitting' is used to describe fittings which do not require manual operation during unloading of the containers. It should be noted that usually these fittings do not mechanically secure the container in the vertical direction (perpendicular to the hatch cover) in the upright condition when subjected to pure vertical motions. Other modes of operation and novel design will be specially considered.

3.2 Materials and design

3.2.1 Steel used for loose container securing fittings is to comply with the requirements of the Rules for Materials or with an equivalent specification acceptable to LR.

3.2.2 Where loose container securing fittings are intended to operate at low ambient temperatures, special consideration is to be given to the specification of the steel.

3.2.3 Proposals for the use of materials other than steel will be specially considered.

3.2.4 Locking devices and other fittings which are inserted into the container castings on the quayside before lifting on board are to be such as to minimise the risk of them working loose under the effects of vibration and the risk of them falling out.

Cargo Securing Arrangements

Part 3, Chapter 14

Section 3

3.2.5 For twistlocks, bottom twistlocks, midlocks, stackers with intermediate plates and fully automatic fittings, the contact areas, for both tension and compression between the fitting and the corner castings of the containers, are to be such as not to exceed a bearing stress of 300 N/mm² under the safe working load of the fitting. No increase in the permissible stress level will be given due to higher strength material of the fittings. In the case where the design is such that the contact area is sloped or inclined and not parallel to the container corner casting, the effective contact area will be specially considered.

3.3 Prototype testing

3.3.1 Prototype tests are to be in accordance with Pt 3, Ch 14, 2.3 Prototype testing, except that Table 14.3.1 Design breaking loads and proof loads for loose container securing fittings and Table 14.3.2 Test loads and test modes for loose container securing fittings are to be applied in lieu of Table 14.2.1 Design breaking loads and proof loads for fixed cargo securing fittings and Table 14.2.2 Test loads and test modes for fixed container securing fittings respectively. For vertical lashing, see Pt 3, Ch 14, 5.4 Containers in more than two tiers.

Table 14.3.1: Design breaking loads and proof loads for loose container securing fittings

Item	Min. proof load		Min. design breaking load	
	SWL ≤ 400 kN	SWL > 400 kN	SWL ≤ 400 kN	SWL > 400 kN
Lashings				
Wire rope			3 x SWL	
Rod: higher tensile steel	1,5 x SWL	SWL + 200 kN	2 x SWL	SWL + 400 kN
Chain mild steel			3 x SWL	
: higher tensile steel			2,5 x SWL	
Other loose container securing fittings	1,5 x SWL		2 x SWL	
Note 1. Higher tensile steel is defined for this purpose as steel having a yield stress not less than 315 N/mm ² . Note 2. Breaking and proof loads for lashings of material other than steel will be considered.				

Table 14.3.2: Test loads and test modes for loose container securing fittings

Item No.	Description	Required test modes	Recommended minimum, in kN		
			SWL	Proof load	Breaking load
1	Lashing rod		180	270	360
2	Lashing rod (HTS)		250	375	500
3	Lashing chain (MS)		80	—	200
4	Lashing chain (HTS)		100	—	300
5	Lashing steel wire rope		120	—	360
6	Turnbuckle	 Tensile load	250	375	500
7	Twistlock (manual, semi-automatic and fully automatic fittings)	 Shear load	200	300	400
		 Tensile load	250	375	500

Cargo Securing Arrangements

Part 3, Chapter 14

Section 3

8	Midlock		Shear load	200	300	400
			Tensile load	250	375	500
9	Stacker		Shear load	200	300	400

Note 1. Where containers with strength higher than required for ISO containers are used, special consideration will be given to the required minimum loads.

Note 2. The test modes illustrated above are diagrammatic only.

Note 3. Other fittings not covered in this Table may be specially considered, see also Pt 3, Ch 14, 3.5 Function and environmental testing.

Note 4. For assessment of a para-lash arrangement, see Pt 3, Ch 14, 5.4 Containers in more than two tiers, where each lashing rod is modelled, the SWL is to be taken as 0,75 times the SWL of a single lashing. Where a single lashing rod is used to model both rods, the SWL is to be taken as 1,5 times the SWL of a single lashing. See also Pt 3, Ch 14, 9.5 Forces in the lashing devices.

3.4 Production testing

3.4.1 The nature and extent of proposed production testing will be considered by LR, but the arrangements are to be at least equivalent to one of the following testing procedures:

(a) For:

- (i) **Loose container securing fittings except chain or wire rope lashings.** One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be proof loaded in accordance with Table 14.3.1 Design breaking loads and proof loads for loose container securing fittings.
- (ii) **Chain or wire rope lashings.** One randomly selected sample from every 50 pieces, or from each batch if fewer than 50 pieces, is to be tested to breaking.

(b) All fittings, securing devices and lashings are to be proof loaded to the SWL of the item and in addition, one randomly selected sample from every batch of chain or wire rope lashings is to be tested to breaking.

3.4.2 Permanent deformation (other than that due to initial embedding of component parts) will not be accepted unless tests are conducted in accordance with Pt 3, Ch 14, 3.4 Production testing and the SWL of the sample is 250 kN or greater. In this case, consideration may be given to acceptance of permanent deformation in the load range between SWL + 125 kN and the proof load, provided that satisfactory manual operation can be achieved after completion of tests.

3.4.3 In the event of premature failure or serious plastic deformation occurring in a test sample, a further randomly selected sample is to be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

3.5 Function and environmental testing

3.5.1 For fittings of novel design or with special features, in addition to the prototype and production testing, a function test may be required to demonstrate that the fitting is fit for purpose. Details of the function test will be considered on an individual basis, taking into consideration the mode of operation of the fitting. In addition, LR reserves the right to require environmental tests. The actual test depends on the individual design of the fitting. The tests are to verify that environmental and ageing effects, such as corrosion, icing, debris contamination, etc. do not impinge on the safe operation of the fitting. In this case, LR reserves the right to require the submission of maintenance instructions as part of the approval procedure.

■ *Section 4* **Ship structure**

4.1 General

4.1.1 The ship structure and hatch covers in way of fixed cargo securing fittings are to be strengthened as necessary, see Pt 3, Ch 14, 1.1 Application.

4.1.2 A breakwater may be required, see Pt 3, Ch 14, 1.1 Application.

4.2 Strength

4.2.1 The SWL of the fixed cargo securing fitting is to be used as the design load when approving the weld attachments and the support structure of the fixed cargo securing fitting.

4.2.2 For container securing arrangements, the design load when approving the weld attachment and supporting structure is to be calculated in accordance with Pt 3, Ch 14, 9 Strength of container securing arrangements.

4.2.3 When considering the loads, all expected directions of operation are to be taken into account.

4.2.4 Stresses induced in the weld attachments, supporting structure, cell guides, lashing bridges and other structures serving as fixed cargo securing points, determined using the design loads as defined in Pt 3, Ch 14, 4.2 Strength, are not to exceed the permissible values given in Table 14.4.1 Permissible stress values.

Table 14.4.1: Permissible stress values

	Permissible stress, N/mm ²
Normal stress (bending, tension, compression)	0,67 σ_o
Shear stress	0,4 σ_o
Combined stress	0,86 σ_o
Symbols	
σ_o = specified minimum yield stress, in N/mm ²	

■ *Section 5* **Container securing arrangements for stowage on exposed decks without cell guides**

5.1 General

5.1.1 Containers stowed on deck or on hatch covers are generally to be aligned in the fore and aft direction (longitudinally stowed), but alternative arrangements will be considered.

5.1.2 Containers are to be stowed so that they do not extend beyond the ship's side. Adequate support is to be provided where they overhang hatch coamings or other deck structures. The stowage arrangements are to be such as to permit safe access for personnel in the necessary working of the ship, and to provide sufficient access for operation and inspection of the securing devices.

5.1.3 Where containers are stowed on hatch covers, the covers are to be effectively restrained against sliding by approved type stoppers or equivalent. Details of the locations of stoppers relative to the supporting structure are to be submitted at an early stage.

5.1.4 Stanchions and similar structure supporting containers and securing devices, such as D-rings for lashings, are to be of adequate strength for the imposed loads and of sufficient stiffness to minimise any deflection which could lead to a reduction in the effectiveness of the securing device.

5.1.5 In the region forward of 0,75L, additional securing devices may be required due to green sea forces, see Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers.

5.1.6 In general, stowage of heavy containers on top of lighter containers is to be avoided, unless validated as being satisfactory by an approved onboard lashing program or covered by the approved container securing arrangement.

5.1.7 Regarding the use of fully automatic fittings, the following requirements apply:

- (a) For fittings where the locking method requires defined clearances between the corner castings and the fixed foundations, such fittings are not to be used at the lowest tier of a stack which is resting with one side on a hatch cover panel and bridging to a container stanchion. The same applies if the stack is resting on different hatch cover panels or foundations where relative deflection during ship operation can occur.
- (b) If the lashing system consists of a combination of fully automatic fittings with lashing rods, only internal cross lashings are to be used. No external lashings or vertical lashings are to be applied, unless the clearance of the loose securing fitting under safe working loads is insignificantly small. Alternative arrangements will be specially considered, taking into consideration the clearances of the fittings.

5.2 Containers in one tier

5.2.1 Containers are to be secured at their lower corners by approved locking devices.

5.2.2 Alternatively, containers may be secured by lashings fitted diagonally or vertically at both ends of each container, in association with cone fittings at each container corner.

5.3 Containers in two tiers

5.3.1 Containers are to be secured at their lower corners at each tier by approved locking devices.

5.3.2 Where the calculations indicate that separation forces will not occur at any point in the stack, double stacking cones may be fitted at all internal corners of the stack and bridge fittings used to connect the tops of the rows in the transverse direction. Locking devices are to be fitted at all external corners.

5.3.3 Alternatively, containers may be secured by lashings in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.

5.4 Containers in more than two tiers

5.4.1 Containers are to be secured at their lower corners at each tier by approved locking devices.

5.4.2 Alternatively, containers may be secured by lashings. One or two tiers of lashings may be fitted in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.

5.4.3 When lashings are employed, they are usually fitted to the bottom corner casting of a container. Proposals to attach lashings to the top casting of a container will be considered. The reduced strength of the upper corner casting compared to the lower corner castings is to be taken into account.

5.4.4 Proposals to use lashings in pairs (para-lash arrangements) will be considered. Lashings in pairs are generally to be attached one to the bottom corner fitting of the upper tier and the other to the top corner fitting of the lower tier container. Suitable connections are to be provided at the lower ends. The effectiveness of paired lashings is to be taken as equal to 1,5 times that of a single lashing.

5.4.5 Where tiers are fitted at higher levels, they are to be secured by locking devices at each corner and each tier.

5.4.6 Proposals to use horizontal lashings connected to lashing bridges will be specially considered. The forces in such securing systems are to be determined by direct calculations, taking into account the following effects:

- stiffness of the container walls, the lashings and the lashing bridge; and
- the possible horizontal displacements of the containers relative to the lashing bridge due to the clearances of the hatch cover stoppers and the container securing fittings.

5.4.7 When vertical lashings are used in combination with container securing fittings, consideration is to be given to the vertical clearances between the fittings and the container corner castings:

- (a) The lashing assembly is to remain elastic when subject to an elongation equating to the number of interface fittings fitted below the point where the vertical lashing is applied to the stack. In order to avoid overstressing of the rod and the turnbuckle, provision of spring or elastic elements incorporated into the turnbuckle may be advantageous. When lashing from lashing bridge level, the number of interfaces is to be counted down to the level where the lowest container is resting. The lashing rod is to be fitted to the bottom casting of the container. For container securing fittings having design clearances in accordance with ISO 3874, a nominal clearance per fitting of 10 mm is to be taken to determine the total elongation of the lashing system. For fittings having clearances in excess of 10 mm, the total elongation is to be calculated, taking into consideration the higher clearances.
- (b) A prototype test is to be carried out to demonstrate that the vertical lashing has a safe working load of 150 kN when elongated up to the calculated total design clearance plus 10 per cent without plastic deformation.
- (c) It is recommended that the load-bearing effect of vertical lashing arrangements be explicitly taken into account when performing lashing calculations. Where this is not done, it is acceptable to allow the permissible calculated lifting force to be increased by 150 kN in addition to the safe working load of the container securing fitting. The nominal lifting force is not to exceed 400 kN at the securing fittings below the fitting position of the vertical lashing.

5.4.8 For stowage arrangements incorporating fully automatic fittings which do not mechanically secure the container in pure vertical direction when subject to vertical motions, it is to be ensured that no separation occurs under the load cases specified in Pt 3, Ch 14, 8 Determination of forces for container securing arrangements. In addition, where exposed stacks are secured with fully automatic fittings without internal cross lashings, provision is to be made to prevent buoyancy forces acting on the container which could disengage the containers. In this case, the use of effective side screens is required. Otherwise, the first tier of containers is to be secured by manual or semi-automatic twistlocks.

5.4.9 If the carriage of one or more tiers of 20 ft containers being overstowed with at least one tier of 40 ft containers, the so-called 'Russian Stow Arrangement', is desired, the following requirements apply.

- (a) At the 20 ft gap the containers are to be secured by means of midlocks, whereas the fore and aft ends are to be secured by twistlocks and if necessary supplemented by lashing rods.
- (b) The 40 ft overstow container is to be secured by twistlocks or if necessary with a combination of twistlocks and lashing rods. The stack is to be assessed in a twostep procedure, as follows:
 - (i) For location at the 40 ft ends, the entire mixed stack is to be considered as a 40 ft stack. The weights of the 40 ft containers are to be considered in the calculations. For the tiers of 20 ft containers, the weight of one 20 ft container is to be taken as the basis for the calculation at each tier.
 - (ii) For the location of the 20 ft tiers at the mid-bay position, the assessment is to be carried out as for an unlashed stack. The 40 ft overstow container does not need to be taken into consideration.

5.5 Line Load stowage

5.5.1 Where the containers are supported on bearers placed to distribute the stackweight as Line Loads, the following requirements are to be complied with:

- (a) The stack is, in general, to comprise a maximum of two tiers of loaded containers.
- (b) The load from the upper tier is to be transferred through the container corners. Line loading is not to be used between tiers.
- (c) The load on each vertical corner post of the bottom tier, calculated in accordance with Pt 3, Ch 14, 9 Strength of container securing arrangements, is not to exceed one half of the Rated Load of the container.
- (d) Where the calculations indicate that lifting forces may occur, locking devices are to be fitted at the container corners.
- (e) The clearance below the bottom container corner casting is to be such that the stacking cone or equivalent cannot be dislodged under shear loading.

5.5.2 Where an approved Line Load stowage system is installed, the special features notation will be suitably modified.

5.6 Systems incorporating structural restraint

5.6.1 Containers may be secured by the use of a fixed structure providing permanent buttresses in association with portable frameworks. Proposals to adopt such systems will be considered on the basis of the loads developed in the structure and the corresponding stresses.

5.6.2 The framework or other devices securing the containers are to be aligned with the container corner fittings and any clearance gap is to be kept to the minimum to reduce shifting.

■ *Section 6***Container securing arrangements for underdeck stowage without cell guides****6.1 General**

6.1.1 Containers are generally to be stowed in holds in the fore and aft direction, but alternative arrangements will be considered. The securing arrangements are to be designed on the basis of the most severe distribution of loads which may arise in the container stack.

6.1.2 Containers may be secured by locking devices only or by a combination of locking devices, buttresses, shores or lashings. Containers are, in general, to be restrained at every corner at the base of the stack and at all intermediate levels.

6.1.3 Where stacks consist of one or two tiers only, consideration will be given to the omission of corner locking devices. Containers must, however, be secured by a minimum of two corner locking devices.

6.1.4 Where the calculations indicate that separation forces could occur at any particular level, twistlocks or equivalent means of securing are to be fitted at that level. Elsewhere, consideration will be given to the use of double stacking cones.

6.1.5 Where the calculations indicate that separation forces will not occur between containers at any level, consideration will be given to the use of stacking cones in lieu of locking devices throughout.

6.1.6 Buttresses are generally to be of the tension and compression type and are to be provided with means of adjustment to ensure tightness when fitted in place. Where applicable, the attachment to the ship's structure is also to include means for vertical adjustment of the buttress to match container stacks of different heights.

6.1.7 Shores of the compression-only type may be permanently attached to the ship structure or they may be hinged or portable. When in place they are to abut the container corner fittings with minimal clearance. Means are to be provided to prevent slackening of the device.

6.1.8 Adjacent stacks of containers are to be linked in line with buttresses or shores in order to transmit lateral loads. The fittings used for these linkages are to be of adequate strength to transmit the loads imposed.

6.1.9 The ship's structure supporting shores and buttresses is to be reinforced as necessary.

6.1.10 Proposals for alternative securing systems, including systems relying on minimal clearance between containers and hull structure, will be specially considered.

6.1.11 Attention is drawn to the safety at work aspects for fittings which require operation on top of containers, e.g. double stacking cones, bridge fittings, buttresses and shores. Where these fittings are used, fall protection is to be provided.

■ *Section 7***Container securing arrangements for stowage using cell guides****7.1 General**

7.1.1 Cell guide systems may be fitted to support containers stowed in holds or on exposed decks.

7.1.2 The cell guides are not to form an integral part of the ship's structure. The guide system is generally to be so designed as to keep it free of the main hull stresses.

7.1.3 Cell guides are to be designed to resist loads caused by loading and unloading of the containers, to prevent shifting of the containers and to transmit the loads caused by motions of the ship into the main hull structure.

7.2 Arrangement and construction

7.2.1 Cell guides are to be of robust construction and generally fabricated from steel plate and rolled sections. They are to have sufficient vertical extent and continuity to provide efficient support to containers. Guide bars are to be effectively attached to the supporting structure to prevent tripping or distortion resulting from container loading.

7.2.2 The intersection between cell guide and cross ties is to provide adequate torsional stability.

7.2.3 Intermediate brackets are to be fitted to vertical cell guides at suitable intervals.

7.2.4 The cell guides are to give a total clearance between the container and guide bars not exceeding 25 mm in the transverse direction and 40 mm in the longitudinal direction. The deviation of the cell guide bar from its intended line is not generally to exceed 4 mm in the transverse direction and 5 mm in the longitudinal direction.

7.2.5 Athwartship cross ties are to be fitted between cell guides at a spacing determined from the loading on the guides but, generally, not more than 3,0 m apart. Wherever possible, cross ties are to be arranged in line with the corners of the containers as stowed and are to be supported against fore and aft movement at a minimum of two points across the breadth of the hold. Where, however, the maximum fore and aft deflection in the cross tie can be shown not to exceed 20 mm, one support point may be accepted.

7.2.6 Longitudinal tie bars may be required to be fitted where shown necessary by the force calculations for the structure. Where fitted, they are to comply with the requirements of Pt 3, Ch 14, 7.2 Arrangement and construction.

7.2.7 Where, at the sides or ends of holds, the guide rails are fitted to transverse or longitudinal bulkheads, the bulkhead is to be locally reinforced to resist the additional loads.

7.2.8 If the carriage of 45 ft Euro containers complying with EU Directive 96/53 is specified to be carried in 45 ft cell guides, attention is to be paid to the arrangement of the corner castings, see Figure 14.7.1 45 ft euro container in cell guides. The guide bars need to be increased in order to ensure that a minimum design overlap, a , of 20 mm is achieved, taking into account the design clearances and tolerances defined in Pt 3, Ch 14, 7.2 Arrangement and construction. Consideration is to be given to the torsional loads being applied to the guide bars.

Figure 14.7.1: 45 ft euro container in cell guides

7.3 Carriage of 20 ft containers in 40 ft cell guides in holds

7.3.1 Where the cell guides are arranged for the carriage of 40 ft containers, provision may be made for the installation of temporary intermediate cell guides for 20 ft containers. The permanent structure is to be designed such that it is suitable for either loading pattern.

7.3.2 Alternatively, permanent means for the support of 20 ft containers at the mid-length of a cell arranged for 40 ft containers will be considered. Such means may include the following:

- (a) A pillar (inboard) and vertical rest bar (on the longitudinal bulkhead) against which the container stack may rest. The pillar is to be supported laterally by the deck structure over and is to be sufficiently stiff to control lateral deflection of the container stacks.
- (b) Guide bars supported transversely by slim structure within the gap between containers and with longitudinal ties as necessary.

Details of proposals will be individually considered, taking into account the loads on the support structure and the resulting deflections.

Cargo Securing Arrangements

Part 3, Chapter 14

Section 7

7.3.3 Where it is desired to stow 20 ft containers without external support at the mid-bay location with or without 40 ft overstow, so-called 'mixed stowage' arrangements meeting the following requirements are applicable:

- (a) Maximum homogeneous container weights for 20 ft containers stowed in cell guides with no 40 ft container overstowed can be derived from Table 14.7.1 Maximum container weights of ISO 1496-1:1990 20 ft containers stowed in 40 ft cell guides with no overstow; Container's rated Weight = 24 t and Table 14.7.1 Maximum container weights of ISO 1496-1:1990 20 ft containers stowed in 40 ft cell guides with no overstow; Container's rated Weight = 24 t, depending on the transverse acceleration and the number of tiers in the stack.
- (b) Maximum homogeneous container weights for 20 ft containers stowed in cell guides with at least one 40 ft container overstowed can be derived from Table 14.7.3 Maximum container weights of ISO 1496-1:1990 20 ft containers stowed in 40 ft cell guides with overstow, depending on the transverse acceleration and the number of tiers in the stack.
- (c) Table 14.7.1 Maximum container weights of ISO 1496-1:1990 20 ft containers stowed in 40 ft cell guides with no overstow; Container's rated Weight = 24 t have been derived on the basis of all containers in a stack having the same homogeneous weight. Where it is intended to carry non-homogeneous mixed stowage stacks, containers heavier than specified in Table 14.7.1 Maximum container weights of ISO 1496-1:1990 20 ft containers stowed in 40 ft cell guides with no overstow; Container's rated Weight = 24 t can be loaded in the lower tiers provided that the total stack weight derived from the Tables is not exceeded. Furthermore, no container having a weight in excess of the maximum weight stated in the Tables is to be stowed on top of a lighter container. However, the total accumulated stack weight derived from the above mentioned Tables may be increased by loading the lowest container in the stack up to its maximum rated weight.
- (d) Means are to be provided to prevent transverse sliding of the bottom of the stacks of 20 ft containers at the mid-bay position. This is to be in the form of permanently attached chocks at the inner bottom or equivalent. The design clearance is to be the same as for the cell guides and in accordance with Pt 3, Ch 14, 7.2 Arrangement and construction.
- (e) Stacking cones are to be fitted at each corner between tiers of the 20 ft containers to prevent transverse and longitudinal sliding. In addition, where a 40 ft container is required to be stowed above 20 ft containers, stacking cones are to be fitted at the ends of the 40 ft container between the 40 ft container and the 20 ft containers below.
- (f) The 20 ft containers are to have closed steel walls and top (no open frame containers, e.g. tank or bulk containers).
- (g) The orientation of the containers is to be such that all front ends or door ends are facing in one direction.
- (h) Cones are to be fitted on the inner bottom in way of the cell guides to restrain container movement in the longitudinal direction.
- (i) The containers are to be stowed in the hold in block stowage. In general, free standing stacks due to adjacent empty stacks are to be avoided.

Proposals for stowage arrangements other than the above will be individually considered and are to be accompanied by supporting calculations.

Table 14.7.1: Maximum container weights of ISO 1496-1:1990 20 ft containers stowed in 40 ft cell guides with no overstow; Container's rated Weight = 24 t

Note 40ft overstow containers not included in the number of tiers.

7.4 Cell guide systems on exposed decks

7.4.1 Analysis methods for the strength of the cell guide structure are to take due account of the interactive effects between guide structure and supporting deck structure and also of the deformation of the hull girder.

7.4.2 At its lower end the guide structure is to be efficiently connected to the deck structure. Cross ties are to be arranged between guides in a transverse direction at a spacing determined by the loading on the guides but in general not more than 3 m apart. Cross-bracing members of adequate strength and sufficient number are to be fitted in the transverse and longitudinal directions to prevent excessive deflection of the guide structure.

7.4.3 The height of guide bars above the deck is to be sufficient to ensure adequate restraint to the uppermost container tiers.

7.4.4 Where the cell guide structure is attached to highly stressed hull or deck elements, such as sheerstrakes, special attention is to be given to the design of the connection and the grade and quality of steel utilised.

7.5 Entry guide devices

7.5.1 A device to pre-centre the container and direct it into the cell guides is normally to be fitted at the top of the guide bars. Such devices include:

- fixed even peaks,
- fixed high and low peaks,
- 'flip-flop' systems,

but other devices will be considered. The device is to be of robust construction.

■ *Section 8*

Determination of forces for container securing arrangements

8.1 General

8.1.1 The forces acting in the securing system are to be determined for each loading condition and associated set of motions of the ship. Although the operation of anti-roll devices or other systems may improve the behaviour of the ship in a seaway, the effect of such devices is not to be taken into account to reduce the determination of the forces for container securing arrangements.

8.1.2 The following forces are to be taken into account:

- Static gravity forces.
- Inertial forces generated by the ship motions in a seaway.
- Wind forces.

- Forces imposed by the securing arrangements.
- Wave impact forces and effects of consequential hull girder whipping.

8.1.3 Forces due to pre-tensioning the securing devices need not, in general, be included in the calculation, provided that they do not exceed 5 kN in any one item. Special consideration will be given to cases where forces obtained from pre-stressing are an integral part of the design of the system.

8.2 Ship motion, wind and green sea forces acting on containers

8.2.1 The forces acting on each container due to gravity, ship motion accelerations, ship rolling and pitching angles and wind forces and green sea forces are to be calculated as follows.

8.2.2 The ship motion amplitude and period for roll and pitch motions are given in Table 14.8.1 Ship motions. The equations for ship motion accelerations and other motion parameters are given in Pt 3, Ch 14, 1.5 Symbols and definitions. These are to be used for the calculation of accelerations to derive the forces for the container securing arrangements. Alternatively, the ship motion values may be derived by direct calculation methods using the same principles as those used to derive the Rule equations.

Table 14.8.1: Ship motions

Motion	Maximum single amplitude	Periods, in seconds
Roll	$\varphi = 55 f_{BK} f_{HsR} e^{(-0,025B)}$ <p>φ is not to be taken less than $f_{HsR} 22^\circ$ but need not exceed 30°</p>	$T_r = \frac{0,82B}{\sqrt{GM}}$
Pitch	$\psi = 1350L^{-0,94} \left(1,0 + \left(\frac{0,82}{\sqrt{L}} \right)^{1,2} \right) f_{HsP}$ <p>ψ need not exceed 8°</p>	$T_p = 0,5 \sqrt{L_{pp}}$ <p>where</p> $C_1 = 0,95 \text{ for MC1}$ $= 0,52 \text{ for all other Motion Cases}$

8.2.3 The following six Motion Cases (MCs) are to be considered:

- MC1: Head sea case that maximises vertical acceleration
- MC2: Beam sea case that maximises roll motion
- MC3: Oblique sea case that maximises pitch acceleration
- MC4: Oblique sea case with forward speed that maximises roll motion
- MC5: Oblique sea case that maximises combined transverse and vertical accelerations
- MC6: Beam sea case that maximises heave acceleration

Each Motion Case comprises 2 or 4 Motion Combination Factor (MCF) sets representing an incoming wave crest or trough coming from either the port or starboard sides. Each MCF set represents an Equivalent Design Wave (EDW) that generates response values equivalent to the long-term response values of the critical load components for ship motion forces acting on containers. The Motion Combination Factors are given in Table 14.8.4 Motion Combination Factors (MCFs).

8.2.4 The individual force components for each Motion Case due to gravity, ship motions, wind and green seas acting on a container i are to be determined as follows, see Figure 14.1.1 Diagrammatic representation of symbols and Figure 14.9.1 Force derivation at one end of a three-tier stack:

$$\begin{aligned}
 H_{Di} &= \text{force acting on container } i \text{ in kN in transverse direction parallel to deck, positive to port} \\
 &= W a_y + H_{Gi}
 \end{aligned}$$

J_{Di} = force acting on container i in kN in longitudinal direction parallel to deck, positive forward

$$= W a_x + J_{Gi}$$

P_{Di} = upwards force acting on container i in kN normal to deck

$$= W a_z + P_{Gi}$$

Q_{Di} = wind force acting on exposed container i in kN in transverse direction parallel to deck

$$= C_{wf} b c_i V_W^2 \cos^2 (C_{yG} \varphi) \times 10^{-4}$$

where

C_{wf} is given in Table 14.8.2 Wind force coefficient C_{wf} and C_{yG} is given in Table 14.8.4 Motion Combination Factors (MCFs)

Note 1. Q_{Di} is only to be applied when Q_{Di} will increase the transverse force H_{Di} .

Note 2. When the green sea force H_{Gi} is also applicable, the wind force is only to be applied to container i when the wind force Q_{Di} is greater than the green sea force H_{Gi} acting on container i . In this case the wind force is to be reduced such that the total combined green sea and wind force is not greater than the originally calculated wind force.

Note 3. See also Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers and Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers.

H_{Gi} = green sea force acting on container i , in kN in transverse direction parallel to deck, positive to port

$$= -b c_i P_{gs} \text{ for port side exposed containers}$$

$$= b c_i P_{gs} \text{ for starboard side exposed containers}$$

J_{Gi} = green sea force acting on container i , in kN in longitudinal direction parallel to deck, positive forward

$$= -a c_i P_{gs}$$

P_{Gi} = green sea force acting on container i , in kN in the upwards direction normal to deck

$$= 1,5a b$$

where

P_{gs} = green sea pressure in kN/m², see Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers and Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers.

<p>Note 1. For definition of Motion Cases, see Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers.</p> <p>Note 2. No wind loads are to be applied to Motion Case MC1.</p> <p>Note 3. For definition of exposed faces, see Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers.</p>		

8.2.5 The total instantaneous acceleration values acting on container i , including the static gravitational term, are to be taken as:

- Longitudinal acceleration (parallel to deck, positive forward)

$$a_x = C_{xS} a_{\text{surge}} + C_{xP} a_{\text{pitch}} z_i - g \sin(C_{xG} \psi) \text{ m/s}^2$$

- Transverse acceleration (parallel to deck, positive to port)

$$a_y = C_{yS} a_{\text{sway}} - C_{yR} a_{\text{roll}} z_i + g \sin(C_{yG} \phi) \text{ m/s}^2$$

- Vertical acceleration (normal to deck, positive upwards)

$$a_z = C_{p1} (C_{zH} a_{\text{heave}} + C_{zR} a_{\text{roll}} y_i - f_{\text{ap}} C_{zP} a_{\text{pitch}} x_i) - g \cos(C_{xG} \psi) \cos(C_{yG} \phi) \text{ m/s}^2$$

where the Motion Combination Factors C_{xS} , C_{xP} , C_{xG} , C_{yS} , C_{yR} , C_{yG} , C_{zH} , C_{zR} and C_{zP} for each Motion Case are given in Table 14.8.4 Motion Combination Factors (MCFs).

8.2.6 Wind forces are generally to be based on a maximum wind speed, V_w , of 40 m/s. Only positive forces of wind pressure are to be applied; suction forces need not be included.

8.2.7 Wind forces are to be taken as acting athwartships on the exposed faces of the container stack. Where the air gap between adjacent rows of containers does not exceed one metre, wind forces on the adjacent inner stack may be taken as zero. Where the air gap is 5 m or more, the adjacent inner stack is to be treated as fully exposed. Wind forces on the inner stack for intermediate air gaps may be obtained by linear interpolation, see Figure 14.8.1 Application of wind forces.

Figure 14.8.1: Application of wind forces

8.2.8 The green sea force is to be applied as follows, see Figure 14.8.2 Example of application of green sea forces:

- When the transverse force H_{Di} is acting inwards, the green sea force H_{Gi} is to be added to H_{Di} for each container in the lowest three tiers of the outermost two stack positions where $x_c > 0,75L$, unless they are protected by another container or effective wraparound breakwater or equivalent.
- When the longitudinal force J_{Di} is acting aftwards, the green sea force J_{Gi} is to be added to J_{Di} for each container in the lowest three tiers where $x_c > 0,75L$, unless the forward end of the container is protected by another container or effective breakwater or equivalent.
- When the vertical acceleration $a_z > -9,81\text{m/s}^2$ (less than g), the green sea force P_{Gi} is to be added to P_{Di} on the exposed underside of the lowest outboard container where $x_c > 0,75L$. The underside is considered exposed if it is raised above the hatch cover or deck by more than 0,5 m and not protected by an effective breakwater or equivalent.

Note In general, Tier 1 position corresponds to lowest tier of containers sitting just above the deck and Tier 2 position corresponds to the lowest tier of containers sitting just above the hatch covers, see Figure 14.8.2 Example of application of green sea forces.

(a) Green sea loading on lowest three tiers only – Effective breakwaters (Forward and wrap around)

(b) Green sea loading on lowest three tiers only – No effective breakwater

Fig. 14.8.2 Example of application of green sea forces

Figure 14.8.2: Example of application of green sea forces

8.2.9 The green sea pressure is given by:

for $L > 100$

$$P_{gs} = C_{G1} L^2 + C_{G2} L + C_{G3} \text{ kN/m}^2 \text{ but not less than } 0$$

for $L \leq 100$, P_{gs} is to be taken as:

$$= 1,5 \text{ for Tier 1}$$

$$= 1,0 \text{ for Tier 2}$$

$$= 0,5 \text{ for Tier 3}$$

where

C_{G1} , C_{G2} , C_{G3} are defined in Table 14.8.3 Green sea pressure coefficients

Proposals to use other values for green sea forces will be specially considered

Section 9

Strength of container securing arrangements

9.1 General

9.1.1 The securing system is to be designed on the basis of the most severe combination of the forces specified in Pt 3, Ch 14, 8 Determination of forces for container securing arrangements in such a manner that the resultant forces on the containers and securing devices are within allowable limits. Where different arrangements of securing devices are proposed for different locations on the ship, the forces are to be calculated for the most severe condition applicable to each arrangement.

9.1.2 The resultant forces in the containers are not to exceed the allowable values given in Pt 3, Ch 14, 9.6 Allowable forces on containers.

9.1.3 The resultant forces in the securing devices and supports are not to exceed the allowable working loads for which the device has been approved, see Pt 3, Ch 14, 2 Fixed cargo securing fittings, materials and testing and Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing.

9.1.4 The forces in lashing devices, where fitted, are not to exceed the allowable safe working loads (SWLs) of the lashings as determined from Pt 3, Ch 14, 3 Loose container securing fittings, materials and testing.

9.2 Applied forces to each container

9.2.1 The applied forces due to ship motion and environmental loads acting on each container in the stack in accordance with Pt 3, Ch 14, 8 Determination of forces for container securing arrangements are illustrated in Figure 14.9.1 Force derivation at one end of a three-tier stack and are assumed to be divided equally between the walls of the container, as follows:

$$H_i = \text{transverse force on each end wall} = \frac{H_{Di}}{2} \text{ kN}$$

$$J_i = \text{longitudinal force on each side wall} = \frac{J_{Di}}{2} \text{ kN}$$

$$P_i = \text{vertical downwards force at the bottom of each corner post} = \frac{-P_{Di}}{4} \text{ kN}$$

$$Q_i = \text{wind force on each end wall} = \frac{Q_{Di}}{2} \text{ kN}$$

The subscript i refers to any particular container.

9.2.2 Forces H_i and J_i are assumed to act at one third of the height of the container above its base. These forces are distributed as follows:

$$\frac{H_i}{3} \left(\text{or } \frac{J_i}{3} \right) \text{ acting at the top of the container, and}$$

$$\frac{2H_i}{3} \left(\text{or } \frac{2J_i}{3} \right) \text{ acting at the bottom.}$$

9.2.3 Wind force is assumed to be uniformly distributed over the side of the container and is therefore divided equally between the top and bottom of the container.

9.3 Total resulting forces in an unlashed stack

9.3.1 Where the stack is supported only by approved devices between the tiers of containers and at the base of the stack, the total forces in the stack are determined from Table 14.9.1 Total resulting forces in each end/side wall of an unlashed stack. Figure 14.9.1 Force derivation at one end of a three-tier stack illustrates the applied forces acting on each container and the resulting total forces.

Table 14.9.1: Total resulting forces in each end/side wall of an unlashed stack

Force	Equations for an unlashed stack
(a) Racking force in end/side wall of container <i>i</i>	
Transverse	$RA_{yi} = \sum_{j=i}^N F_j \text{ kN}$ <p>where the transverse force at level <i>j</i> is given by</p> $F_j = \frac{2H(j+1)}{3} + \frac{H_j}{3} + \frac{Q(j+1)}{2} + \frac{Q_j}{2} \text{ kN for } j < N \text{ and}$ $F_j = \frac{H_j}{3} + \frac{Q_j}{2} \text{ kN for } j = N$
Longitudinal	$RA_{xi} = \sum_{j=i}^n G_j \text{ kN}$ <p>where the longitudinal force at level <i>j</i> is given by</p> $G_j = \frac{2J(j+1)}{3} + \frac{J_j}{3} \text{ kN for } j < N \text{ and}$ $G_j = \frac{J_j}{3} \text{ kN for } j = N$
(b) Shear force acting at bottom corner device of container <i>i</i>	
Transverse	$SF_{yi} = 0,55 \sum_{j=i}^N (H_j + Q_j) \text{ kN}$
Longitudinal	$SF_{xi} = 0,55 \sum_{j=i}^N J_j \text{ kN}$
Total shear force	$SF_i = \sqrt{SF_{xi}^2 + SF_{yi}^2} \text{ kN}$
(c) Compressive force in each corner post of container <i>i</i>	
Port fwd	$V_{pfi} = \sum_{j=i}^N P_j + \frac{1}{a} \sum_{j=i}^N F_j h_{ij} + \frac{1}{b} \sum_{j=i}^N G_j h_{ij} \text{ kN}$
Port aft	$V_{pai} = \sum_{j=i}^N P_j + \frac{1}{a} \sum_{j=i}^N F_j h_{ij} - \frac{1}{b} \sum_{j=i}^N G_j h_{ij} \text{ kN}$
Starboard fwd	$V_{sfi} = \sum_{j=i}^N P_j - \frac{1}{a} \sum_{j=i}^N F_j h_{ij} + \frac{1}{b} \sum_{j=i}^N G_j h_{ij} \text{ kN}$

Cargo Securing Arrangements

Part 3, Chapter 14

Section 9

Starboard aft	$V_{sai} = \sum_{j=i}^N P_j - \frac{1}{a_j} \sum_{j=i}^N F_j h_{ij} - \frac{1}{b_j} \sum_{j=i}^N G_j h_{ij} \text{ kN}$
Symbols	
<p>h_{ij} is the height from the bottom of the fitting (e.g. twistlock) below corner post i to the top of container j, in metres</p> $h_{ij} = \sum_{k=i}^J (c_k + d_k)$ <p>N is the total numbers of tiers</p> <p>Q_j is only applied to the exposed container faces</p>	

Figure 14.9.1: Force derivation at one end of a three-tier stack

9.3.3 For exposed stacks forward of $0,75L$, see Pt 3, Ch 14, 8.2 Ship motion, wind and green sea forces acting on containers.

9.3.4 To illustrate this calculation, the equations for calculation of the transverse forces only for the three-tier stack shown in Figure 14.9.1 Force derivation at one end of a three-tier stack are listed below. For simplicity, the equations below do not include the longitudinal forces. The complete method to combine longitudinal and transverse forces for an unlashed stack is given in Table 14.9.1 Total resulting forces in each end/side wall of an unlashed stack.

(a) Transverse racking force in each end wall:

$$\text{Tier 3: } RA_{y3} = F_3$$

$$\text{Tier 2: } RA_{y2} = F_3 + F_2$$

$$\text{Tier 1: } RA_{y1} = F_3 + F_2 + F_1$$

(b) Transverse shear force at each bottom corner fitting:

$$\text{Tier 3: } SF_{y3} = 0,55 (H_3 + Q_3)$$

$$\text{Tier 2: } SF_{y2} = 0,55 (H_3 + H_2 + Q_3 + Q_2)$$

$$\text{Tier 1: } SF_{y1} = 0,55 (H_3 + H_2 + H_1 + Q_3 + Q_2 + Q_1)$$

(c) Compressive force at bottom of each port side corner post (i.e. force on the container below):

$$\text{Tier 3: } V_{p3} = P_3 + \frac{F_3}{a} (c_3 + d_3)$$

$$\text{Tier 2: } V_{p2} = P_3 + P_2 + \frac{F_3}{a} (c_3 + c_2 + d_3 + d_2) + \frac{F_2}{a} (c_2 + d_2)$$

$$\text{Tier 1: } V_{p1} = P_3 + P_2 + P_1 + \frac{F_3}{a} (c_3 + c_2 + c_1 + d_3 + d_2 + d_1) + \frac{F_2}{a} (c_2 + c_1 + d_2 + d_1) + \frac{F_1}{a} (c_1 + d_1)$$

(d) Compressive force at bottom of each starboard side corner post (i.e. force on the container below):

$$\text{Tier 3: } V_{s3} = P_3 - \frac{F_3}{a} (c_3 + d_3)$$

$$\text{Tier 2: } V_{s2} = P_3 + P_2 - \frac{F_3}{a} (c_3 + c_2 + d_3 + d_2) - \frac{F_2}{a} (c_2 + d_2)$$

$$\text{Tier 1: } V_{s1} = P_3 + P_2 + P_1 - \frac{F_3}{a} (c_3 + c_2 + c_1 + d_3 + d_2 + d_1) - \frac{F_2}{a} (c_2 + c_1 + d_2 + d_1) - \frac{F_1}{a} (c_1 + d_1)$$

A negative value in equations Pt 3, Ch 14, 9.3 Total resulting forces in an unlashed stack and Pt 3, Ch 14, 9.3 Total resulting forces in an unlashed stack indicates a separation force at that level.

9.3.5 The transverse displacements of the container stack are to be calculated as follows. The displacement of the top corner of container i under the actions of the applied forces is given by:

$$\delta_{yi} = \sum_{j=1}^i \left(\frac{RA_{yi}}{k_{cy}} \right) \text{ mm}$$

δ_{yi} is to be calculated for each end wall of the container

where

RA_{yi} = transverse racking force in end wall of container i , see also Table 14.9.1 Total resulting forces in each end/side wall of an unlashed stack

$$= \sum_{j=1}^N F_j \text{ kN}$$

k_{cy} = shear spring stiffness of the end wall being considered, see Table 14.9.2 Shear spring stiffness of container walls.

Table 14.9.2: Shear spring stiffness of container walls

Container height, metres	Door end kN/mm	Closed end kN/mm	Side wall kN/mm
2,438 (8 ft)	3,7	16,7	6,1
2,591 (8 ft 6 in)	3,5	15,4	5,7
2,743 (9 ft)	3,3	14,3	5,4
2,896 (9 ft 6 in)	3,2	13,3	5,1

9.3.6 The longitudinal displacements of the container stack are to be calculated as follows. The displacement of the top corner of container i under the actions of the applied forces is given by:

$$\delta_{xi} = \sum_{j=1}^i \left(\frac{RA_{xj}}{k_{cx}} \right) \text{ mm}$$

δ_{xi} is to be calculated for each side wall of the container.

9.4 Total resulting forces in a stack incorporating lashings

9.4.1 Where the securing arrangements incorporate lashings, proper allowance is to be made for flexibility of the system. For this purpose, the following values may be adopted:

- Racking deformation of the container.** Full scale testing of containers indicates that values of the shear spring stiffness constant (see Figure 14.9.2 Example of lashings at one end of a four-tier stack) may be taken as in Table 14.9.2 Shear spring stiffness of container walls.
- Horizontal movement of the containers.** Initial displacement of containers due to tolerances in container fittings will be considered in conjunction with the stowage arrangement proposed. Generally, initial displacement may be neglected in calculation procedures for conventional stowages.
- Elongation of the lashings.** Elongation may be determined by reference to an effective cross-sectional area of lashing device and an effective modulus of elasticity of the lashing (allowance for straightening and stretching), which in the absence of actual test values may be taken as specified in Table 14.9.3 Effective modulus of elasticity of lashing devices.

Table 14.9.3: Effective modulus of elasticity of lashing devices

Lashing equipment	Effective modulus of elasticity (E_r) see Pt 3, Ch 14, 9.5 Forces in the lashing devices
Steel rod lashings of hook type, including turnbuckle	98 kN/mm ²
Short (one tier) steel rod lashings (knob type), including turnbuckle and lashing eyes	140 kN/mm ²
Long (two tier) steel rod lashings (knob type), including turnbuckle and lashing eyes	175 kN/mm ²
Steel wire rope lashings	90 kN/mm ²
Steel chain lashings (based on the nominal diameter of the chain)	80 kN/mm ²
Adjustable tension/compression buttress	120 kN/mm ²
Aluminium or other materials	To be specially considered

9.4.2 Any other element introducing flexibility into the structure between the lashing point and the base of the container stack is to be evaluated and taken into account, if necessary. Examples of this could be flexibility of a lashing bridge, sliding of a hatch cover or torsional deformations of the hull.

9.4.3 The following lashing devices may be used:

- A shore device or similar that only accepts compressive loads, see Pt 3, Ch 14, 6.1 General. This may be modelled in a similar way to a lashing rod. However, where more than one stack is supported by the use of linkages between adjacent containers in line with the shore, the calculation model is to take this into account.
- A lashing bridge to allow lashing devices to be arranged high up in the container stack. Where open framework systems are fitted on deck to provide structural restraint, they are to be designed to absorb the full horizontal component of force at that

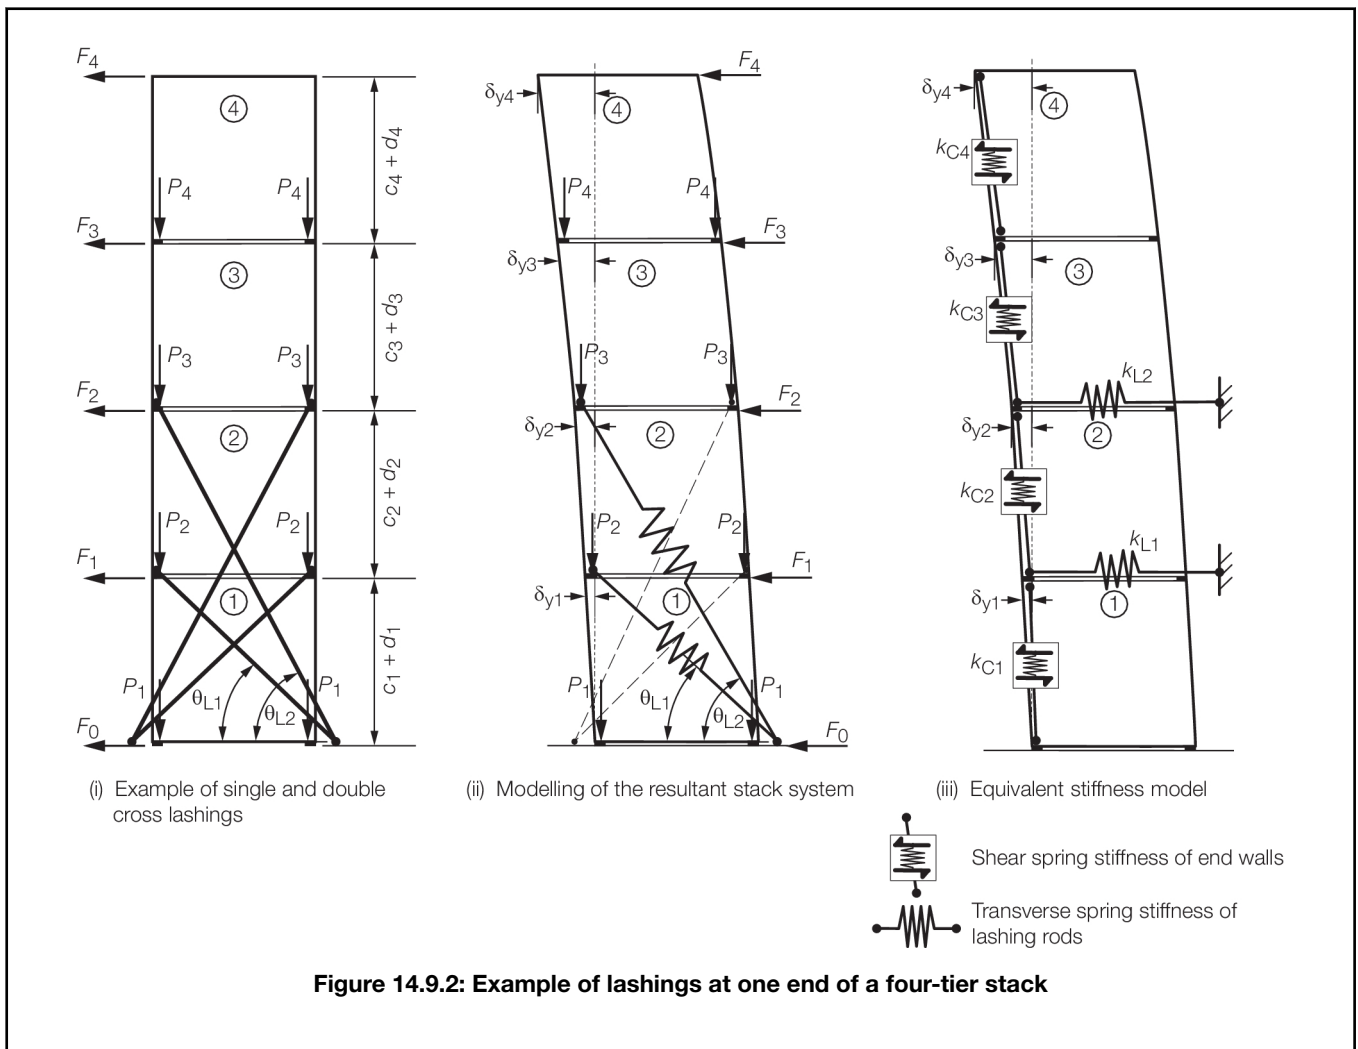

level and to prevent movement of the container stack. For the purpose of these calculations, the deformation of the ship's structure in way of supports may be neglected.

- A buttress connection or tension/compression device that accepts compressive and tensile forces, see Pt 3, Ch 14, 6.1 General. These are normally used for hold stowage. Where more than one stack is supported by the use of linkages between adjacent containers in line with the buttress, the calculation model is to take this into account.

9.4.4 The applied forces due to ship motion and environmental loads on containers in the stack are to be determined in accordance with Pt 3, Ch 14, 9.2 Applied forces to each container.

9.4.5 The tensile or compressive forces in lashing devices supporting the container stack are to be determined in accordance with Pt 3, Ch 14, 9.5 Forces in the lashing devices.

9.4.6 The load system for a four-tier stack of containers with transverse upper and lower lashings is illustrated in Figure 14.9.2 Example of lashings at one end of a four-tier stack. The containers and lashings are modelled as a system of springs whose stiffness may be calculated and hence the equilibrium condition for the system may be found, see Figure 14.9.2 Example of lashings at one end of a four-tier stack.

9.4.7 The calculations are to be made for each end of the container stack, that is, with all door ends together and with all closed ends together, and also for each side wall.

9.4.8 The transverse displacements of the container stack are to be calculated as follows. The displacement of the top corner of container i under the actions of the applied forces and supporting lashing devices is given by:

$$\delta_{yi} = \sum_{j=1}^i \left(\frac{RA_{yj}}{k_{cy}} \right) \text{ mm}$$

δ_{yi} is to be calculated for each end wall of the container, taking into account lashing devices attached to the top corner of container i and the bottom corner of container $(i + 1)$

where

RA_{yi} = transverse racking force in end wall of container i , taking into account lashing rods and other lashing devices attached to the top corner of container i and above attached to the end wall being considered, see also Table 14.9.4 Total resulting forces in each end/side wall of an unlashed stack

$$= \sum_{j=1}^N F_j + \sum_{r=1}^R TL_{yr} \text{ kN}$$

k_{cy} = shear spring stiffness of the end wall being considered, see Table 14.9.2 Shear spring stiffness of container walls

TL_{yr} = force in lashing device r , measured in the transverse direction, see Pt 3, Ch 14, 9.5 Forces in the lashing devices.

9.4.9 The longitudinal displacements of the container stack are to be calculated as follows. The displacement of the top corner of container i under the actions of the applied forces and supporting lashing devices is given by:

$$\delta_{xi} = \sum_{j=1}^i \left(\frac{RA_{xj}}{k_{cx}} \right) \text{ mm}$$

δ_{xi} is to be calculated for each side wall of the container, taking into account lashing devices attached to the top corner of container i and the bottom corner of container $(i + 1)$.

9.4.10 The final distribution of forces in the stack is to be obtained by equating the total transverse displacements of the container stack δ_{yi} due to the applied loads with the transverse elongations in the attached lashing devices ε_{Lyr} . This is illustrated in Figure 14.9.2 Example of lashings at one end of a four-tier stack. Hence, at each lashing device, the following equation is to be satisfied:

$$\delta_{yi} = \varepsilon_{Lyr} \text{ mm}$$

where

ε_{Lyr} = elongation or strain in the transverse direction in the lashing device, in mm.

9.4.11 The equations for deriving the total forces in the stack with lashings are given in Table 14.9.4 Total resulting forces in each end/side wall of an unlashed stack. The final distribution of forces in a stack can also be solved using matrix methods.

Table 14.9.4: Total resulting forces in each end/side wall of an unlashed stack

Force	Equations for lashed stack
(a) Racking force in end/side wall of container i Taking into account lashing rods and other lashing devices attached to the top corner of container i and above	
Transverse	$RA_{yi} = \sum_{j=i}^N F_j + \sum_{r=i}^R TL_{yr} \text{ kN}$ <p>To be evaluated for each end wall of the container taking into account lashing devices attached to the wall being considered</p>

Cargo Securing Arrangements

Part 3, Chapter 14

Section 9

Longitudinal	$RA_{xi} = \sum_{j=i}^N G_j + \sum_{r=i}^R TL_{xr} \text{ kN}$ <p>To be evaluated for each side wall of the container taking into account lashing devices attached to the wall being considered</p>
<p>(b) Compressive force in each corner post of container <i>i</i></p> <p>Taking into account lashing rods and other lashing devices attached to the top corner of container <i>i</i> and above. The lashing device forces appropriate to the wall and corner are to be taken into account</p>	
Transverse	$SF_{yi} = 0,55 \sum_{j=i}^N (H_j + Q_j) + 0,55 \sum_{r=i}^R TL_{yr} \text{ kN}$ <p>To be evaluated for each end wall of the container, taking into account lashing devices attached to the wall being considered</p>
Longitudinal	$SF_{xi} = 0,55 \sum_{j=i}^N (J_j) + 0,55 \sum_{r=i}^R TL_{xr} \text{ kN}$ <p>To be evaluated for each side wall of the container, taking into account lashing devices attached to the wall being considered</p>
Total shear force	$SF_i = \sqrt{SF_{xi}^2 + SF_{yi}^2} \text{ kN}$ <p>To be evaluated for each corner</p>
<p>(c) Compressive force in each corner post of container <i>i</i></p> <p>Taking into account lashing rods and other lashing devices attached to the top corner of container <i>i</i> and above. The lashing device forces appropriate to the wall and corner are to be taken into account</p>	
Port fwd	$V_{pfi} = \sum_{j=i}^N P_j + \frac{1}{a} \sum_{j=i}^N F_j h_{ij} + \frac{1}{b} \sum_{j=i}^N G_j h_{ij} + \sum_{r=1}^R TL_r \sin \theta_{Lr} + \frac{1}{a} \sum_{r=1}^R TL_{yr} h_{ir} + \frac{1}{b} \sum_{r=1}^R TL_{xr} h_{ir} \text{ kN}$
Port aft	$V_{pai} = \sum_{j=i}^N P_j + \frac{1}{a} \sum_{j=i}^N F_j h_{ij} - \frac{1}{b} \sum_{j=i}^N G_j h_{ij} + \sum_{r=1}^R TL_r \sin \theta_{Lr} + \frac{1}{a} \sum_{r=1}^R TL_{yr} h_{ir} - \frac{1}{b} \sum_{r=1}^R TL_{xr} h_{ir} \text{ kN}$
Starboard fwd	$V_{sfi} = \sum_{j=i}^N P_j - \frac{1}{a} \sum_{j=i}^N F_j h_{ij} + \frac{1}{b} \sum_{j=i}^N G_j h_{ij} + \sum_{r=1}^R TL_r \sin \theta_{Lr} - \frac{1}{a} \sum_{r=1}^R TL_{yr} h_{ir} + \frac{1}{b} \sum_{r=1}^R TL_{xr} h_{ir} \text{ kN}$
Starboard aft	$V_{sai} = \sum_{j=i}^N P_j - \frac{1}{a} \sum_{j=i}^N F_j h_{ij} - \frac{1}{b} \sum_{j=i}^N G_j h_{ij} + \sum_{r=1}^R TL_r \sin \theta_{Lr} - \frac{1}{a} \sum_{r=1}^R TL_{yr} h_{ir} - \frac{1}{b} \sum_{r=1}^R TL_{xr} h_{ir} \text{ kN}$
<p>(d) Compressive/lifting force at the bottom fitting of each corner post of container <i>i</i></p> <p>Taking into account lashing rods and other lashing devices attached to the bottom corner of container <i>i</i> and above. The lashing device forces appropriate to the wall and corner are to be taken into account. The equations for the 'Compressive force in each corner post' are applied except that the lashing rods attached to the bottom of the container are included. This only affects the $\sum_{r=1}^R TL_r \sin \theta_{Lr}$ term</p>	
Symbols	
<p>h_{ir} is the height from the bottom of the lower corner device of container <i>i</i> to lashing point <i>r</i>, in metres</p> <p><i>R</i> is the total number of lashing devices</p> <p><i>Q</i> is only applied to the exposed container faces</p>	

9.4.12 Similar calculations are to be applied in the longitudinal direction if any lashing device will resist longitudinal forces. For such lashings, the fixed lashing plates are to be suitably arranged to accommodate the additional forces due to the fore and aft inclination of the lashing rods. In addition, the design of the lashing rod head should be suitable for the angle of inclination of the lashing rod.

9.4.13 The above stiffness model assumes that the securing devices between tiers of containers are capable of resisting negative (separation) forces. That is, where separation forces are found, suitable locking devices are assumed to be fitted and transmitting load. When this is not the case, special consideration of the vertical displacements of the corners and forces in the lashing devices is necessary.

9.5 Forces in the lashing devices

9.5.1 The tensile or compressive force in a lashing device is given by:

$$TL_r = \varepsilon_{Lr} k_{Lr} \text{ kN}$$

The lashing device force in the positive transverse direction (i.e. positive to port) is given by:

$$TL_{yr} = \varepsilon_{Lr} k_{Lr} \cos \theta_{Lr} \sin \theta_{Lxyr} \text{ kN}$$

The lashing device force in the positive longitudinal direction (i.e. positive forwards) is given by:

$$TL_{xr} = \varepsilon_{Lr} k_{Lr} \cos \theta_{Lr} \cos \theta_{Lxyr} \text{ kN}$$

where

k_{Lr} = stiffness of lashing rod or device r , in kN/mm, see Pt 3, Ch 14, 9.4 Total resulting forces in a stack incorporating lashings.

9.5.2 The stiffness of a lashing rod may be derived as follows:

$$k_{Lr} = \frac{E_r A_r}{l_r}$$

= if E_r and A_r are specified otherwise k_{Lr} may be directly specified

E_r = effective modulus of elasticity, see Table 14.9.3 Effective modulus of elasticity of lashing devices

A_r = cross-sectional area of lashing device

For a para-lash arrangement, where two lashing devices are modelled as a single device, the effective area is to be taken as 1,5 times the area of one device. If each device in a paralash arrangement is modelled, the effective area for each device is to be taken as 0,75 times the area of the single device.

ε_{Lr} = total elongation, in mm, of lashing rod or device r

$$\varepsilon_{Lr} = \sqrt{(l_x - \delta_{xib})^2 + (l_y - \delta_{yib})^2 + (l_z - \delta_{zib})^2} - l_r$$

ε_{Lr} = for a lashing rod device

ε_{Lr} = 0 for a shore device (compression-only device), see Pt 3, Ch 14, 6.1 General

ε_{Lr} = can be negative or positive for a buttress lashing connection or tension/compression lashing device, see Pt 3, Ch 14, 6.1 General

i_b = $i - 1$ if lashing device is connected to the bottom of the container

i_b = i if lashing device is connected to the top of the container

l_x = longitudinal distance of lashing foundation from container corner fitting, in mm, positive forward

l_y = transverse distance of lashing foundation from container corner fitting, in mm, positive to port

l_z = vertical separation of lashing foundation from container corner fitting, in mm, positive downwards

l_r = length of lashing rod or device, in mm

$$= \sqrt{(l_x)^2 + (l_y)^2 + (l_z)^2} \omega$$

δ_{xi} = total longitudinal racking deflection of the top corner of container i , in mm

δ_{yi} = total transverse racking deflection of the corner of container i , in mm

δ_{zi} = total vertical displacement of the bottom corner of container i , in mm

θ_{Lr} = angle of the lashing rod r in the vertical plane

$$\theta_{Lr} = \tan^{-1} \left(\frac{l_z}{\sqrt{l_x^2 + l_y^2}} \right) \text{ degrees}$$

NOTE

θ_{Lr} = is 90° when l_x and l_y are both zero

θ_{Lxyr} = angle of the lashing rod r in the xy plane (projection onto the horizontal plane)

$$= \tan^{-1} \left(\frac{l_y}{l_x} \right) \text{ degrees}$$

Use the atan2 function to maintain sign of angle. θ_{Lxyr} is 0° when l_x is positive and l_y is zero, θ_{Lxyr} is $+90^\circ$ when l_x is 0 and l_y is positive, θ_{Lxyr} is -90° when l_x is 0 and l_y is negative.

9.5.3 Where external support is provided by a buttress or shore, the load is to be transmitted between adjacent stacks by linkages in line with the support. The force in the transverse end wall members of the containers adjacent to the support is given by:

$$F_b \left(\frac{2N-1}{2N} \right) \text{ kN and the force in the linkage to the adjacent container is } F_b \left(\frac{N-1}{N} \right) \text{ kN}$$

where

F_b = calculated force in the buttress or shore, in kN

N = number of rows of containers supported by the buttress or shore.

9.6 Allowable forces on containers

9.6.1 For ISO containers, the securing arrangements are to be designed so that the forces on the containers do not exceed the values shown in Table 14.9.5 Allowable forces on ISO containers. The maximum forces for ISO 1496-1: 1990 including Amendment Nos. 1, 2 and 3 containers are illustrated in Figure 14.9.3 Allowable forces for 20 ft or 40 ft containers constructed to ISO 1496-1:1990 including Amendment Nos. 1, 2 and 3. Proposals to carry out the lashing calculations for containers manufactured in accordance with ISO 1496-1:1990/Amendment No. 4, 2006 will be specially considered.

Cargo Securing Arrangements

Part 3, Chapter 14

Section 9

Table 14.9.5: Allowable forces on ISO containers

	ISO 1496-1:1990 including up to Amendment No. 3	
	20ft	40ft
	in kN	
Horizontal force from a container fitting acting parallel to the side face	150	150
Horizontal force from lashing on container fitting acting parallel to the end face, see Note 1	225	225
Vertical force from lashing on container fitting acting parallel to the end or side face, see Note 1	250	250
Racking force on container end	150	150
Racking force on container side	150	150
Vertical forces at each top corner, tension	250	250
Vertical forces at each bottom corner, tension	250	250
Vertical forces at each top corner post, compression	848	848
Vertical forces at each bottom corner casting of the lowest container in a stack, compression	848 + (1,8Rg/4) see Note 3	848 + (1,8Rg/4) see Note 3
Transverse forces acting at the level of and parallel to the top face, tension or compression, see Note 2	340	340
Transverse forces acting at the level of and parallel to the bottom face, tension or compression, see Note 2	500	500
<p>Note 1. In no case is the resultant of the horizontal and the vertical forces to exceed the limiting values derived from Figure 14.9.3 Allowable forces for 20 ft or 40 ft containers constructed to ISO 1496-1:1990 including Amendment Nos. 1, 2 and 3. The horizontal and vertical forces are the maximum components of a diagonal force and are not to be used as the maximum load if horizontal or vertical lashings are employed.</p> <p>Note 2. Where a buttress supports the stack at an intermediate level, the total transverse force in the containers at the level is not to exceed the sum of the appropriate top and bottom forces.</p> <p>Note 3. The vertical compression force on the lower corner casting on the closed end of the lowest container may exceed 848 + (1,8Rg/4) kN, provided the following conditions are complied with:</p> <p>(a) The vertical compression force acting on the lowest container from the container above does not exceed 848 kN.</p> <p>(b) The horizontal racking force acting on the lowest container from the container above does not exceed 150 kN.</p> <p>(c) The local ship side or hatch cover container foundation is designed and approved for the increased design compression force.</p> <p>(d) The loose bottom container securing fittings should have a contact area fulfilling the requirements of Pt 3, Ch 14, 3.2 Materials and design.</p>		

9.6.3 The allowable forces for containers of other dimensions, e.g. 24 ft, 48 ft and 53 ft, will be determined on the basis of the values in Table 14.9.5 Allowable forces on ISO containers and of the forces for which the container has been certified.

9.6.4 Where 45 ft containers in accordance with ISO 1496-1:1990/Amendment No. 4, 2006 are stowed on top of a 40 ft container, the corner post load of the top castings of the 45 ft container is not to exceed a compression force of 404 kN. Consideration should be given to the strength of the container bottom structure to withstand the forces transmitted. No lashings are to be applied to the ends of the 45 ft container if stowed on top of a 40 ft unit.

■ *Section 10* **Surveys**

10.1 Initial Survey

10.1.1 The following requirements are mandatory for fixed fittings, including cell guides, if fitted, on all ships. For ships having a **CCSA** class notation the requirements are also applicable for loose fittings.

10.1.2 The Surveyor is to be satisfied that the materials, workmanship and arrangements are satisfactory and in accordance with the requirements and the approved plans. Any items found not to be in accordance with the requirements or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory are to be rectified.

10.1.3 A Register or plan is to be kept on board and up to date, and is to be made available to the Surveyor upon request. The Register or plan is to contain sufficient details to enable all fittings to be identified, including:

- a simple sketch;
- the name of the item;
- the number supplied;
- the manufacturer's mark or code; and
- the safe working load with the corresponding breaking load.

10.1.4 For container securing arrangements, a suitable Container Stowage Arrangement Plan is to accompany the Register. Where containers of types other than ISO containers are proposed to be carried, their stowage locations are to be clearly indicated on the plan.

10.1.5 The Register and stowage plans, if applicable, may be included in the Cargo Securing Manual.

10.2 Periodical Surveys

10.2.1 For the requirements for Periodical Surveys, see Pt 1, Ch 3, 2.2 Annual Surveys and Pt 1, Ch 3, 5.3 Examination and testing.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 1

Section

- 1 **General**
- 2 **Application**
- 3 **Particulars to be submitted**
- 4 **Requirements of Parts 1 and 2 of the Scheme**
- 5 **Additional requirements for Part 2 of the Scheme**
- 6 **Initial assessment of the shipyard**
- 7 **Approval of the shipyard**
- 8 **Maintenance of approval**
- 9 **Suspension or withdrawal of approval**

■ Section 1 General

1.1 Definitions

1.1.1 **Quality Assurance Scheme.** Lloyd's Register's (hereinafter referred to as 'LR') Quality Assurance requirements for the hull construction of ships are defined as follows:

- **Quality Assurance.** All activities and functions concerned with the attainment of quality including documentary evidence to confirm that such attainment is met.
- **Quality system.** The organisation structure, responsibilities, activities, resources and events laid down by Management that together provide organised procedures (from which data and other records are generated) and methods of implementation to ensure the capability of the shipyard to meet quality requirements.
- **Quality programme.** A documented set of activities, resources and events serving to implement the quality system of an organisation.
- **Quality plan.** A document derived from the quality programme setting out the specific quality practices, special processes, resources and activities relevant to a particular ship or series of sister ships. This document will also indicate the stages at which, as a minimum, direct survey and/or system monitoring will be carried out by the Classification Surveyor.
- **Quality control.** The operational techniques and activities used to measure and regulate the quality of hull construction to the required level.
- **Inspection.** The process of measuring, examining, testing, gauging or otherwise comparing the item with the approved drawings and the shipyard's written standards including those which have been agreed by LR for the purposes of classification of the specific ship type concerned.
- **Assessment.** The initial comprehensive review of the shipyard's quality systems, prior to the granting of approval, to establish that all the requirements of these Rules have been met.
- **Audit.** A documented activity aimed at verifying by examination and evaluation that the applicable elements of the quality programme continue to be effectively implemented.
- **Hold point.** A defined stage of manufacture beyond which the work must not proceed until the inspection has been carried out by all the relevant personnel.
- **System monitoring.** The act of checking, on a regular basis, the applicable processes, activities and associated documentation that the Shipbuilder's quality system continues to operate as defined in the quality programme.
- **Special process.** A process where some aspects of the required quality cannot be assured by subsequent inspection of the processed material alone. Manufacturing special processes include welding, forming and the application of protective treatments. Inspection and testing processes classified as special processes include non-destructive examination and pressure and leak testing.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 2

1.2 Scope of the Quality Assurance Scheme

1.2.1 This Chapter specifies the minimum Quality System requirements for a shipyard to construct ships under LR's Quality Assurance Scheme.

1.2.2 For the purposes of this Chapter of the Rules, hull construction comprises the hull structure; containment systems, including those which are independent of the main hull structure; appendages; superstructures; deckhouses; and closing appliances all as required by the Rules.

1.2.3 Although the requirements of this Scheme are, in general, for steel ships of all welded construction, other materials for use in hull construction will be considered.

■ Section 2 Application

2.1 Certification of the shipyard

2.1.1 LR will give consideration to a shipyard's Quality Assurance System provided, at all times, there is full commitment by all the shipyard personnel to the implementation and maintenance of this system. On satisfactory completion of assessments and audits LR will issue certificates of approval to the shipyard as indicated in Pt 3, Ch 15, 2.1 Certification of the shipyard.

2.1.2 LR's Quality Assurance Scheme comprises:

- | | |
|--------|--|
| Part 1 | The requirements of the Quality System for hull construction which are applicable to shipyards operating a quality programme but not necessarily constructing to LR's Class. Certificates of approval valid for three years will be issued, with intermediate audits at intervals of 6 months. |
| Part 2 | The Quality System requirements for hull construction for application to ships under construction to LR's Class as part of the Special Survey. LR's particular requirements for construction of ships to its Class, and the continuous involvement in the hull construction process by a combination of direct survey and systems monitoring by LR's Surveyors, are provided for by Part 2. Where LR considers that there is a stage in construction at which a high degree of direct inspection by the Surveyors is desirable, this stage will be described on the Part 2 Approval Certificate. |

Certificates of approval for Part 2 will be valid for one year, and will be issued after satisfactory assessment/audit carried out at a suitable stage during construction to LR's Class. Part 1 certification will automatically be issued, or re-issued as applicable, on attainment of Part 2 approval.

2.1.3 Chemical carriers with cargo tank structure of material other than carbon manganese steel and the cargo containment system on ships for liquefied gases will be specially considered. The procedure relating to the construction of such structure on chemical carriers and liquefied gas containment systems is to be separately prescribed in the Quality Plan which will be subject to approval by LR.

2.1.4 The Quality System at a shipyard will be examined for compliance with these Rules by the assessments and audits as laid down in Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme, Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme and Pt 3, Ch 15, 6 Initial assessment of the shipyard. Initial and periodical approval of the system will be considered by the Committee on receipt of satisfactory assessment and audit reports.

2.1.5 All information and data submitted by a Shipbuilder for approval under this Scheme and for maintenance of approval will be treated by LR in strict confidence and will not be disclosed to any third party without the prior written consent of the Shipbuilder.

2.1.6 A list of shipyards approved under the Scheme will be held in the *List of Shipyards Approved to the Requirements of the Quality Assurance Scheme*.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 3

■ Section 3 Particulars to be submitted

3.1 Documentation and procedures

3.1.1 Under either Part of the Scheme, the documentation to meet the requirements of Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme is to be submitted. This documentation includes the Quality Manual, Quality Plans, documented procedures and work instructions.

3.1.2 Additionally, under Part 2 of the Scheme the documentation to meet the requirements of Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme is to be submitted for approval. Construction plans and all necessary particulars are also to be submitted for approval in accordance with the relevant requirements of the Rules. See Pt 1, Ch 2, 3.2 New construction surveys.

3.2 Amendments

3.2.1 Any major changes to the documentation or procedures required by Pt 3, Ch 15, 4 Requirements of Parts 1 and 2 of the Scheme or Pt 3, Ch 15, 5 Additional requirements for Part 2 of the Scheme are to be re-submitted.

■ Section 4 Requirements of Parts 1 and 2 of the Scheme

4.1 General

4.1.1 The requirements of this Section are applicable to shipyards seeking approval under Parts 1 and 2 of the Scheme.

4.2 Policy statement

4.2.1 A policy statement, signed by the chief executive of the shipyard concerned, confirming the full commitment of all levels of personnel in the shipyard to the implementation and sustained operation of quality assurance methods is to be included in the Quality Manual.

4.3 Responsibility

4.3.1 Personnel responsible for functions affecting quality are to have defined responsibility and authority to identify, control and evaluate quality.

4.4 Management Representative

4.4.1 The Shipbuilder is to appoint a Management Representative, who is to be independent of other functions unless specifically agreed otherwise by LR, and who is to have the necessary authority and responsibility for ensuring that the requirements of the Scheme are complied with.

4.4.2 The Management Representative is to have the authority to stop production if serious quality problems arise.

4.5 Quality control and testing personnel

4.5.1 The Shipbuilder is to utilise quality control and testing personnel whose performance and continued freedom of influence from production pressures is to be systematically confirmed by the Management Representative.

4.6 Resources

4.6.1 Sufficient resources shall be provided by the shipyard to enable the requirements identified by the Quality Management System to be effectively implemented.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 4

4.7 The Quality Management System

4.7.1 The Shipbuilder is to establish, document and maintain an effective Quality Management System that will ensure and demonstrate that materials and consumables used, and working processes employed, conform to the requirements for hull construction.

4.7.2 **Quality Manual.** The basic documentation is to be in the form of a Quality Manual which sets out the general quality policies and which references the detailed procedures, standards, etc. and includes the requirements of Pt 3, Ch 15, 4.2 Policy statement to Pt 3, Ch 15, 4.24 Sub-contracted personnel, services and components and, where appropriate, Pt 3, Ch 15, 5.1 Quality System procedures to Pt 3, Ch 15, 5.10 Sub-contracted personnel, services and components.

4.7.3 **Procedures.** The Shipbuilder is to establish, document and maintain an adequate and defined control of the hull construction process comprising:

- (a) defined and documented controls, processes, procedures, tolerances, acceptance/rejection criteria and workmanship standards; and
- (b) the provision of Quality Plans for each ship or series of sister ships for the processes and procedures for manufacture, inspection and testing involved from receipt of material through to completion of the hull construction process.

4.7.4 **Work instructions.** The Shipbuilder is to develop and maintain clear and complete documented work instructions for the processes and standards involved in the construction of the hull. Such instructions are to provide directions to various levels of personnel.

4.8 Regulatory requirements

4.8.1 The Shipbuilder is to establish that the requirements of all applicable Regulations are clearly specified and agreed with the Owner/Classification Society/Regulatory Authority. These Regulations are to be made available for all functions that require them and their suitability is to be reviewed.

4.8.2 The Shipbuilder is to establish a design verification procedure to ensure that the regulatory requirements have been incorporated into the design output.

4.9 Control of hull drawings

4.9.1 The Shipbuilder is to establish, document and maintain a procedure for the submission to the Classification Society and other regulatory bodies of all the necessary drawings required for approval sufficiently early and in such a manner that the requirements of the Classification Society and other regulatory bodies can be included in the design before construction commences. This procedure is to include a provision which ensures that all amendments to approved drawings are incorporated in the working drawings and that design revisions are re-submitted for approval.

4.10 Documentation and change control

4.10.1 The Shipbuilder is to establish a procedure to ensure that:

- (a) valid drawings, specifications, procedures, work instructions and other documentation necessary for each phase of the fabrication process are prepared;
- (b) all necessary documents and data are made readily available at all appropriate work, testing and inspection locations;
- (c) all amended drawings and changes to documentation are processed in a timely manner to ensure inclusion in the production process;
- (d) records are maintained of amendments and changes to documentation; and
- (e) provision is made for the prompt removal or immediate identification of all superseded drawings and documentation throughout the shipyard.

4.11 Purchasing data and receipt

4.11.1 The Shipbuilder is to maintain purchasing documents containing a clear description of the materials ordered for use in hull construction and the standards to which material must conform, and the identification and certification requirements.

4.11.2 For the requirements for receiving inspection of purchased items see Pt 3, Ch 15, 4.15 Control of inspection and testing.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 4

4.12 Owner supplied material

4.12.1 The Shipbuilder is to have procedures for the inspection, storage and maintenance of Owner supplied materials and equipment.

4.13 Identification and traceability

4.13.1 The Shipbuilder is to establish and maintain a procedure to ensure that materials and consumables used in the hull construction process are identified (by colour-coding and/or marking as appropriate) from arrival at the shipyard through to erection in such a way as to enable the type and grade to be readily recognised. The procedure is to ensure that the Shipbuilder has the ability to identify material in the completed vessel and ensure traceability to the mill sheets.

4.14 Fabrication control

4.14.1 The Shipbuilder is to establish, document and maintain suitable procedures to ensure that fabrication and construction operations are carried out under controlled conditions. Controlled conditions are to include:

- (a) clearly documented work instructions defining material treatment, marking, cutting, forming, sub-assembly, assembly, erection, fitting of closing appliances, use of fabrication aids and associated fit-up, weld preparation, welding and dimensional control procedures;
- (b) criteria for workmanship and manufacturing tolerances. These are to be documented in a clear manner and made available to the appropriate workforce, and are to include acceptance/rejection criteria; and
- (c) documented instructions for the control of equipment and machines used in fabrication. These are to be made available to the appropriate workforce and supplied to individuals where necessary.

4.14.2 The Shipbuilder is to establish and control welding, non-destructive examination and painting which are part of the fabrication system, the equipment used in such processes and the environment in which they are employed. Operators of these special processes are to be properly qualified. Details of these processes are to be included in the relevant Quality Plans.

4.14.3 A list of approved welding procedures is to be maintained and made available to relevant personnel. Records of the results of testing for approval are also to be maintained. Lists of appropriately qualified welders are to be maintained. Procedures for distribution and recycling of welding consumables are to be implemented.

4.14.4 The Shipbuilder is to establish, document and maintain adequate maintenance schedules and standards for all equipment associated with the hull construction process.

4.15 Control of inspection and testing

4.15.1 The Shipbuilder is to be responsible for ensuring that all incoming plates, sections, castings, components, fabrications and consumables and other materials used in the hull construction process are inspected or otherwise verified as conforming to purchase order requirements.

4.15.2 The Shipbuilder is to provide an inspection system at suitable stages of the fabrication process from the material delivery to the completion of hull construction. The inspection system is to confirm and record the inspections carried out.

4.16 Indication of inspection status

4.16.1 The Shipbuilder is to establish and maintain a system for identifying the inspection status of structural components at appropriate stages of the fabrication process. This may include the direct marking of components. Records of inspection and measurements are to be identifiable to components to which they refer and be readily accessible to production and inspection personnel and to Classification Surveyors.

4.17 Inspection, measuring and test equipment

4.17.1 The Shipbuilder is to be responsible for the control, calibration, and maintenance of the inspection, measuring and test equipment used in the fabrication and non-destructive examination of the hull structure.

4.17.2 The calibration system is to allow traceability back to appropriate National Standards. Where these do not exist the basis of calibration is to be defined.

4.18 Non-conforming materials and corrective action

4.18.1 The Shipbuilder is to establish and define procedures to provide for:

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 4

- (a) the clear identification and segregation from production areas of all plates, sections, castings, components, fabrications, consumables and other materials which do not conform to the agreed specification; and
- (b) the initiation of authorised corrective or alternative action.

4.19 Protection and preservation of quality

4.19.1 The Shipbuilder is to establish and maintain a procedure to control handling and preservation processes for both the material used in fabrication and the structural components at all stages of the fabrication process. This procedure is to ensure conformance to specified requirements and established standards.

4.19.2 Welding consumables are to be stored, handled and recycled according to maker's recommendations.

4.20 Records

4.20.1 The Shipbuilder is to develop and maintain records that demonstrate achievement of the required quality and the effective operation of the Quality System. Records demonstrating sub-contractor achievement of these requirements are to be maintained. These records are to be retained and available for a defined period. These records are to include identification of materials and consumables used in fabrication, the number and class of defects found during fabrication and information regarding corrective action taken. Records of particular processes, e.g. plate surface preparation and priming, marking, cutting, forming, accuracy control, non-destructive examination, audits and all other records pertaining to the operation of the Quality System are also to be maintained.

4.21 Internal audit and management review

4.21.1 Internal audits of the performance of all aspects of the systems relating to design, production and testing are to be carried out systematically by appointed staff and recorded under the authority of the Management Representative. These staff members will not normally audit functions for which they are directly responsible.

4.21.2 Using data obtained from the audits and any other available relevant information, management reviews are to take place at specified intervals or more frequently as deemed necessary in order to review the performance of the Quality System.

4.21.3 The Shipbuilder is to establish, document and maintain a procedure for corrective application of data feedback from previous construction, including previous ships during the guarantee period.

4.21.4 The Shipbuilder is to establish, document and maintain a procedure to provide for the analysis of departures from manufacturing standards, steel material scrapped, reworked or repaired during the fabrication and construction process in order to detect trends, investigate the cause to determine the action needed to correct the processes and work procedures, or to identify the further training of operators as appropriate.

4.21.5 Agreed improvements to the Quality System are to be implemented within a time scale appropriate to the nature of the improvement.

4.22 Training

4.22.1 The Shipbuilder is to establish and maintain a system to identify training needs and ensure that all personnel involved in the fabrication, erection and quality-involved functions have adequate experience, training and qualifications. This requirement extends to sub-contractor personnel working within the shipyard. Records are to be available to the Classification Surveyor.

4.23 Sampling

4.23.1 Any sampling processes used by the Shipbuilder are to be in accordance with specified or Statutory Requirements or to the satisfaction of the Classification Surveyor as applicable.

4.24 Sub-contracted personnel, services and components

4.24.1 The requirements of the Scheme are applicable, as appropriate, to all sub-contractor personnel and sub-contracted services operating within the shipyard.

4.24.2 The requirements of the Scheme are not applicable to sub-contractor personnel or sub-contracted services operating at locations outside the shipyard. In these circumstances it will be necessary for inspections to be carried out by the LR Surveyor using conventional survey methods.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 5

■ Section 5

Additional requirements for Part 2 of the Scheme

5.1 Quality System procedures

5.1.1 The procedures detailed in Pt 3, Ch 15, 4.7 The Quality Management System are to be submitted for approval.

5.2 Quality Plans

5.2.1 Quality Plans for ships which are to be classed by LR are to be submitted for approval well in advance of commencement of work, irrespective of any submissions that may have been made for sister ships under Part 1 of the Scheme. Such Quality Plans are to outline all of the manufacturing, testing and inspection operations to be performed by the Shipbuilder and by which personnel they will be carried out. The Quality Plans are then to be submitted to the LR Surveyors who will indicate all the stages at which they will perform system monitoring, carry out direct inspection and participate in hold point inspections. These hold points will include, but not be limited to, the following:

- (a) Radiographs and other test records of non-destructive examinations as required for Classification purposes, see Ch 13, 2.12 Non-destructive examination of welds of the Rules for Materials.
- (b) The items described in Pt 3, Ch 1, 8 Inspection and workmanship relevant to the scope of this Chapter.

5.2.2 Notwithstanding what may have been agreed in the Quality Plans, the LR Surveyors have the discretion to increase their involvement, see *also* Pt 3, Ch 15, 8.1 General.

5.3 Material supplier approval

5.3.1 The Shipbuilder is to ensure that hull construction materials and consumables used are selected from manufacturers who are approved by LR.

5.4 Identification and traceability

5.4.1 The procedure required by Pt 3, Ch 15, 4.13 Identification and traceability is to be submitted for approval.

5.5 Fabrication control

5.5.1 The information required by Pt 3, Ch 15, 4.14 Fabrication control will be examined for acceptability.

5.5.2 Procedures for material treatment, forming, weld preparation and welding are to be submitted for approval.

5.5.3 Procedures required by Pt 3, Ch 15, 4.14 Fabrication control are to be submitted to the LR Surveyors for approval.

5.6 Control of inspection and testing

5.6.1 The inspection stages incorporated into the Scheme are to include specific checks for fit-up and welding which are to be carried out at each sub-assembly, assembly, pre-erection and erection stage as well as self-checking by the operator. The number of recorded checks to each stage will be agreed with the LR Surveyor, after consideration of documentary evidence of quality being achieved. Repairs, where required, are to be effected after each check. Collated Quality Control data to demonstrate the efficiency of the above self-check system are to be made available to the LR Surveyor by the Shipbuilder. The Quality Plans referred to in Pt 3, Ch 15, 4.7 The Quality Management System provide the opportunity for the Shipbuilder and the LR Surveyor to consider the structural design and ship type fully in order to determine the most efficient and effective inspection stages.

5.7 Control of non-conforming materials and corrective action

5.7.1 All predetermined repair procedures are to be consistent with the requirements of Pt 3, Ch 15, 4.7 The Quality Management System and are to be to the satisfaction of the LR Surveyor. Where a defect is found, whether by the LR Surveyor or through shipyard inspection, for which no agreed repair procedure exists, approval is to be obtained from the LR Surveyor before any corrective action is effected.

5.8 Records

5.8.1 The shipyard is to make data available to the LR Surveyor, to demonstrate the efficiency of the inspection system, see Pt 3, Ch 15, 5.6 Control of inspection and testing.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 6

5.9 Training

5.9.1 The competence of the welding operators, non-destructive examination and other personnel involved in special processes and inspection are to be to the satisfaction of the LR Surveyor.

5.10 Sub-contracted personnel, services and components

5.10.1 The requirements of the Scheme are not applicable to those services operating at locations outside the shipyard. It will be necessary for inspections to be carried out by the LR Surveyor using conventional survey methods.

5.10.2 The methods of control for the requirements of Pt 3, Ch 15, 4.24 Sub-contracted personnel, services and components are to be submitted to the LR Surveyor.

■ Section 6

Initial assessment of the shipyard

6.1 General

6.1.1 In the first instance applications for approval under this Scheme will be considered on the recommendation of the local Surveyors.

6.1.2 After receipt and appraisal of the main quality documentation, an assessment of the shipyard is to be carried out by the Surveyors to examine all aspects of the Quality System applicable to hull construction.

6.1.3 The Surveyors will review the quality arrangements proposed by the Shipbuilder at the shipyard. They may advise as to how the proposed Quality System might be improved and where it is considered inadequate, advise how it might be revised to be acceptable to LR.

6.1.4 For assessment to Part 1 of the Scheme, the Surveyors will review the Quality System in association with the quality documentation and will check that all aspects of the System are established and in accordance with the requirements of Pt 3, Ch 15, 3 Particulars to be submitted.

6.1.5 For assessment of Part 2 of the Scheme, the Surveyors will confirm that the requirements given in Pt 3, Ch 15, 3 Particulars to be submitted have been fully implemented and are complied with by a detailed examination of work in progress and by confirming that workmanship and the quality level being consistently achieved are to their satisfaction.

■ Section 7

Approval of the shipyard

7.1 General

7.1.1 If the initial assessment confirms that the shipyard's quality arrangements are satisfactory, the Committee will issue Part 1 or Part 2 and Part 1 of LR's Quality Assurance Approval Certificates as appropriate. Maintenance of approval will be subject to the provisions of Pt 3, Ch 15, 8 Maintenance of approval.

7.1.2 Approval by another organisation will not be accepted as sufficient evidence that the arrangements for hull construction comply with these requirements.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 8

■ Section 8 Maintenance of approval

8.1 General

8.1.1 For Part 2 of the Scheme, the arrangements approved at the shipyard are to be kept under review by the Surveyors to ensure that the approved Quality System is being maintained in a satisfactory manner. This is to be carried out by:

- (a) Regular and systematic audits by the LR Surveyor.
- (b) Comprehensive Annual Audits. The audit team leader will be formally nominated by LR.

8.1.2 Where a comprehensive audit cannot be carried out due to lack of a current building programme to Class, demonstration that the requirements of Part 1 of the Scheme are being maintained may be confirmed by audit review at intervals of six months, normally by the local Surveyors. Where necessary a comprehensive triennial audit would be carried out by a Surveyor formally nominated by LR. The degree of re-assessment for re-approval at the recommencement of building to LR's Class would be at the discretion of the Committee.

8.1.3 All documentation, including reports, is to be available to the Surveyors.

8.1.4 Minor alterations in the approved procedures may be permitted provided that the Surveyors are advised and their prior concurrence obtained. Major alterations would need to be submitted for approval and may require an additional audit.

8.1.5 In a shipyard constructing ships to LR's Class, the following are applicable:

- (a) The LR Surveyor is to be allowed access at all reasonable times to all records pertaining to quality and to all parts of the shipyard involved in the implementation and maintenance of the Quality Assurance Programme.
- (b) The LR Surveyor is immediately to advise the Management Representative of any matter pertaining to the Quality System with which he is not satisfied.
- (c) When minor deficiencies in the approved procedures are discovered during audits, or if workmanship is considered unsatisfactory, the LR Surveyor will apply more intensive auditing and inspection.
- (d) Notwithstanding any of the provisions of the Quality System, all work related to Classification of ships with LR is to be to the satisfaction of the LR Surveyor.

■ Section 9 Suspension or withdrawal of approval

9.1 General

9.1.1 When the Surveyors have drawn attention to significant faults or deficiencies in the Quality System or its operation and these have not been rectified within a period of time acceptable to LR, the approval of the system, together with the associated certification, will be withdrawn and the shipyard's name deleted from the *List of Shipyards Approved to the Requirements of the Quality Assurance Scheme*.

9.1.2 If a significant period of time elapses between such withdrawal and any application for reinstatement, the reapproval procedures, if agreed to by the Committee, may require a restructuring of the Quality Management System and will always require a complete re-examination as for an initial assessment.

ShipRight Procedures for the Design, Construction and Lifetime Care of Ships

Part 3, Chapter 16

Section 1

Section

- 1 **General**
- 2 **Construction monitoring**
- 3 **Structural design assessment**
- 4 **Fatigue design assessment**
- 5 **Whipping design assessment**
- 6 **Ship Event Analysis**
- 7 **Enhanced scantlings**
- 8 **Corrosion protection of internal tanks and spaces**
- 9 **Ship Emergency Response Service**
- 10 **Assessment of Ballast Water Management Plans**
- 11 **Inventory of hazardous materials**
- 12 **Safe return to port and orderly evacuation**

■ Section 1 General

1.1 Application

1.1.1 Where one or more of Lloyd's Register's (hereinafter referred to as 'LR') ShipRight procedures have been satisfactorily applied whether on a mandatory or voluntary basis, the associated ShipRight notation or descriptive note as detailed in Pt 1, Ch 2, 2.3 Class notations (hull) or Pt 1, Ch 2, 2.8 Descriptive notes will be assigned.

1.1.2 In addition to the ShipRight procedures indicated in this Chapter, details of all LR ShipRight procedures are given in the *ShipRight Procedures Overview document*. Details of machinery ShipRight procedures can also be found in Pt 5, Ch 21 Requirements for Condition Monitoring Systems and Machinery Condition-Based Maintenance Systems.

■ Section 2 Construction monitoring

2.1 Construction Monitoring notation – CM

2.1.1 Extended controls on structural alignment, fit up and workmanship standards are to be applied in accordance with the *ShipRight Construction Monitoring Procedure*, to areas of the ship structure that have been requested or have been shown by other ShipRight procedures to be in need of particular attention. The ShipRight Construction Monitoring Procedure is mandatory when one or more of the procedures indicated in Pt 3, Ch 16, 3 Structural design assessment, Pt 3, Ch 16, 4 Fatigue design assessment, or Pt 3, Ch 16, 5 Whipping design assessment have been applied, whether voluntarily or on a mandatory basis. Where the relevant procedures have been applied, the ShipRight notation **CM** is to be assigned, see also Pt 1, Ch 2, 2.3 Class notations (hull).

ShipRight Procedures for the Design, Construction and Lifetime Care of Ships

Part 3, Chapter 16

Section 3

■ Section 3 Structural design assessment

3.1 Structural Design Assessment notation - SDA

3.1.1 Where specified in the Rules the ship structure is to be assessed using finite element modelling in accordance with the applicable ShipRight SDA procedures. Where the relevant procedures have been applied whether on a voluntary or mandatory basis the ShipRight notation **SDA** will be assigned, see *also* Pt 1, Ch 2, 2.3 Class notations (hull). In general the mandatory application criteria for implementation of one of the associated ShipRight SDA procedures is as follows:

- (a) bulk carriers and oil tankers without a **CSR** notation greater than 190 m in length;
- (b) ore carriers equal to and greater than 150 m in length;
- (c) container ships with a beam greater than 32 m;
- (d) the primary structure of LNG ships fitted by membrane cargo tanks;
- (e) the primary structure of LNG ships fitted with independent Type B spherical cargo tanks;
- (f) the primary structure of LPG ships fitted with Independent Type A cargo tanks;
- (g) passenger ships where it is required to utilise the load carrying capability of the superstructure for longitudinal strength; or where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where a limited number of transverse bulkheads above the bulkhead deck are present to carry the racking response;
- (h) other ships of abnormal hull form or where the type, size and structural configuration demand; and
- (i) upon application of any of the following ShipRight notations: **FDA**, **FDA plus()**, **FDA ICE**, **FDA SPR** and **WDA**, see *also* Pt 3, Ch 16, 4 Fatigue design assessment and Pt 3, Ch 16, 5 Whipping design assessment.

In addition to the above, and where applicable, the structural capability to withstand dynamic loadings from partially filled tanks or the influence of thermal loadings may also be required to be assessed.

■ Section 4 Fatigue design assessment

4.1 Fatigue Design Assessment notations – FDA, FDA plus, and FDA ICE and FDA SPR

4.1.1 Where specified in the Rules the fatigue performance of the hull structure is to be assessed in accordance with the applicable ShipRight FDA procedures. Where an appraisal has been made whether on a voluntary or mandatory basis of the fatigue performance of the hull structure in accordance with the relevant procedures and found to comply with the requirement of 20 years fatigue life based on the 100A1 Fatigue Wave Environment (World-wide) trading pattern the ShipRight notation **FDA** will be assigned, see *also* Pt 1, Ch 2, 2.3 Class notations (hull). In general the ShipRight FDA procedure is mandatory for all bulk carriers and oil tankers without a **CSR** notation and of length greater than 190 m or where the type, size and structural configuration demand. The ShipRight notation **FDA** is not applicable to ships approved using the IACS Common Structural Rules.

4.1.2 Where an appraisal is requested for a higher level of fatigue performance of the hull structure than that made for the assignment of the ShipRight notation **FDA**, the relevant procedures for the application of the ShipRight notation **FDA plus()** are to be applied. The appraisal may be made based upon a specific trading pattern, which is to be expressed in terms of either a Worldwide trading route, as defined in the relevant ShipRight procedures, or a North Atlantic trading route (that utilises the wave data from IACS Recommendation 34). The ShipRight notation **FDA plus()** is to be followed by the number of years that the vessel has been assessed for the specific trading pattern shown in brackets, for either the Worldwide or North Atlantic trading routes, denoted by **WW** and **NA** respectively, e.g. **FDA plus(25, NA)**. This procedure is applicable to all ships including those built in accordance with the IACS Common Structural rules.

4.1.3 Where an appraisal is requested for the fatigue performance of the hull structure when navigating through ice, the relevant ShipRight FDA ICE procedures are to be applied. Where the relevant procedures have been applied the ShipRight notation **FDA ICE** will be assigned, see *also* Pt 1, Ch 2, 2.3 Class notations (hull).

4.1.4 Where specified in the Rules an appraisal is to be made of the fatigue performance of the hull structure taking into account of the effects due to the continuous vibrational response of the hull girder in waves (springing) in accordance with the

ShipRight Procedures for the Design, Construction and Lifetime Care of Ships

Part 3, Chapter 16

Section 5

relevant ShipRight procedures. Where the relevant procedures have been applied the ShipRight notation **FDA SPR** will be assigned, see *also* Pt 1, Ch 2, 2.3 Class notations (hull).

■ Section 5 Whipping design assessment

5.1 Whipping Design Assessment notations – WDA

5.1.1 Where specified in the Rules an appraisal is to be made of the vibrational response of the hull structure due to wave impact loads (Whipping) in accordance with the relevant ShipRight procedures. Where the relevant procedures have been applied the ShipRight notation **WDA** will be assigned, see *also* Pt 1, Ch 2, 2.3 Class notations (hull).

■ Section 6 Ship Event Analysis

6.1 Ship Event Analysis

6.1.1 At the Owner's request and in order to enhance safety and awareness on board during ship operation, the *ShipRight Ship Event Analysis Procedure* applies to all ships where it is intended to provide a hull surveillance system for:

- (a) Monitoring of the ship's hull girder stresses and motions, and warning the ship's personnel that these stress levels or the frequency and magnitude of slamming motions are approaching a level where corrective action is advisable.
- (b) Monitoring of the ship's hull girder stresses and local ice loads when the ship is navigating in ice, and warning the ship's personnel that the load levels or the frequency and magnitude of ice impacts are approaching a level where corrective action is advisable.

■ Section 7 Enhanced scantlings

7.1 Enhanced Scantlings - Descriptive note ES

7.1.1 Where scantlings in excess of the approved Rule minimum are fitted at defined locations, a descriptive note **ES**, Enhanced Scantlings, will be entered in column 6 of the *Register Book*. For example, the note **ES+1** will indicate that an extra 1 mm has been fitted to the hull envelope plating (i.e. deck, side and bottom).

■ Section 8 Corrosion protection of internal tanks and spaces

8.1 Protective coating systems in dedicated sea-water ballast tanks and double-side skin spaces – ShipRight Notations ACS(B) or ACS(B,D)

8.1.1 For ships that are required to comply with IMO Resolution MSC.215(82), Performance Standards for Protective Coatings (PSPC), all dedicated sea-water ballast tanks for all ship types and double-side skin spaces of bulk carriers are to have type approved coating systems applied in accordance with ShipRight Procedure *Anti-Corrosion Systems Notation*, see Ch 15 Corrosion Prevention of the Rules for Materials and Pt 1, Ch 2, 2.3 Class notations (hull) for the list of ShipRight ACS notations.

ShipRight Procedures for the Design, Construction and Lifetime Care of Ships

Part 3, Chapter 16

Section 8

8.1.2 **ShipRight ACS(B)** or **ShipRight ACS(B,D)** will be entered in Column 4 of the *Register Book* to indicate that the ship's sea water ballast tanks and double-side skin spaces of bulk carriers are coated with approved coating systems according to IMO Resolution MSC.215(82), Performance Standards for Protective Coatings.

8.2 Protective coating systems in the cargo oil tanks of crude oil tankers – ShipRight Notation ACS(C)

8.2.1 For ships that are required to comply with IMO Resolution MSC.291(87) Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as amended, Owners may request to receive the optional notation **ShipRight ACS(C)**, which indicates that the cargo oil tanks are protected in compliance with IMO Resolution MSC.288(87), Performance Standard for Protective Coatings for Cargo Oil Tanks of Crude Oil Tankers (PSPC-COT), and are to have type approved coating systems applied in accordance with ShipRight Procedure *Anti-Corrosion System Notation* and Ch 15 Corrosion Prevention of the Rules for Materials.

8.2.2 **ShipRight ACS(C)** will be entered in Column 4 of the *Register Book* to indicate that the ship's cargo oil tanks are protected using approved materials in accordance with IMO Resolution MSC.291(87) Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as amended.

8.2.3 When in compliance with IMO Resolution MSC.291(87), but the **ShipRight ACS(C)** notation is not requested, this compliance may be indicated on the applicable certification, Ch 15 Corrosion Prevention of the Rules for Materials.

8.3 Alternative means of corrosion protection for cargo oil tanks of crude oil tankers – ShipRight notation ACS(C*)

8.3.1 For ships that are required to comply with the IMO Resolution MSC.291(87), Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as amended, Owners may request to receive the optional notation **ShipRight ACS(C*)**, which indicates that all cargo tanks are protected in accordance with IMO Resolution MSC.289(87) Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks of Crude Oil Tankers, by application of corrosion resistant steel, see Ch 3, 1.3 Corrosion resistant steels for cargo oil tanks of crude oil tankers of the Rules for Materials and ShipRight Procedure *Anti-Corrosion System Notation*.

8.3.2 **ShipRight ACS(C*)** will be entered in Column 4 of the Register Book to indicate that the ship's cargo oil tanks are protected using approved materials in accordance with IMO Resolution MSC.291(87) Adoption of Amendments to the International Convention for the Safety of Life at Sea, 1974, as amended.

8.3.3 When in compliance with IMO Resolution MSC.291(87), but the **ShipRight ACS(C*)** notation is not requested, this compliance may be indicated on the applicable certificate.

8.4 Protective coatings for void spaces on bulk carriers and oil tankers – ShipRight Notation ACS(V)

8.4.1 For ships within the scope of IMO Resolution MSC.244(83), Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers, Owners may request to receive the optional notation **ShipRight ACS(V)**, which indicates that the void spaces are protected according to the *ShipRight Procedure Anti-Corrosion System Notation*.

8.4.2 **ShipRight ACS(V)** will be entered in Column 4 of the *Register Book* to indicate that the ship's void spaces are protected in accordance with IMO Resolution MSC.244(83), Adoption of Performance Standard for Protective Coatings for Void Spaces on Bulk Carriers and Oil Tankers.

8.4.3 When in compliance with IMO Resolution MSC.244(83), but the **ShipRight ACS(V)** notation is not requested, this compliance may be indicated on the applicable certificate.

8.5 Protective coating systems in dedicated seawater ballast tanks – Descriptive note PCWBT

8.5.1 For ships that are not required to comply with IMO Resolution MSC.215(82), Performance Standards for Protective Coatings, all sea-water ballast spaces having boundaries formed by the hull envelope are to have a corrosion protection coating applied, see ShipRight Procedure *Protective Coatings in Water Ballast Tanks (PCWBT)*.

8.5.2 Where requested, a descriptive note **PCWBT** (Protective Coating in Water Ballast Tanks) will be entered in column 6 of the *Register Book* to indicate that all sea-water ballast spaces having boundaries formed by the hull envelope have a corrosion protection coating applied, and that the coating remains efficient and is maintained in good condition. If the coatings have broken down, particularly at more critical areas, and no effort is being made to maintain the coatings, then this note will be placed in parentheses, i.e. **(PCWBT)**. In either case, the date of the last survey will be placed in parentheses after the note.

■ Section 9

Ship Emergency Response Service

9.1 Ship Emergency Response Service - Descriptive note SERS

9.1.1 This service, offered by LR, provides a rapid computer assisted analysis of a damaged ship's stability and damaged longitudinal strength in the event of a casualty to the ship.

9.1.2 Where an Owner adopts this service, the descriptive note **SERS**, 'Ship is registered with LR's Ship Emergency Response Service', will be entered in column 6 of the *Register Book*.

■ Section 10

Assessment of Ballast Water Management Plans

10.1 Ballast Water Management Plan – Descriptive note BWMP

10.1.1 Compliance with this procedure is optional. A ship meeting the requirements of this procedure will be eligible for an appropriate **ShipRight BWMP** descriptive note, which will be recorded in column 6 of the *Register Book*.

■ Section 11

Inventory of hazardous materials

11.1 Inventory of hazardous materials – Descriptive note IHM

11.1.1 Compliance with this procedure is optional. A ship meeting the requirements of this procedure will be eligible for a ShipRight **IHM** Descriptive Note, which will be recorded in column 6 of the *Register Book*, except as indicated in Pt 3, Ch 16, 11.1 Inventory of hazardous materials – Descriptive note IHM.

11.1.2 If a ship has been assigned the **ECO** notation, then it will not be eligible for an **IHM** Descriptive Note. Instead, **IHM** will be referenced in the **ECO** notation, i.e. **ECO(IHM)**.

■ Section 12

Safe return to port and orderly evacuation

12.1 Safe Return to Port and Orderly Evacuation – Descriptive Note SRtP

12.1.1 Compliance with this procedure is optional. A ship meeting the requirements of this procedure will be eligible for a ShipRight **SRtP** Descriptive Note, which will be recorded in column 6 of the *Register Book*.

■ *Section 1* **General**

1.1 Application

1.1.1 This Chapter applies to sea-going ships designed primarily for the carriage of general cargo. The requirements are intended to cover the midship region, but may also apply with suitable modification to the taper regions forward and aft in way of cargo spaces.

1.2 Structural configuration

1.2.1 The Rules provide for a basic structural configuration of a multi-deck or a single deck hull which includes a double bottom, or a single bottom arrangement. The structural configuration may also include a single or multiple arrangement of cargo hatch openings, and side tanks.

1.2.2 Individual consideration may be required where the ship incorporates double hull construction, large deck openings or other special design features.

1.2.3 Longitudinal framing is, in general, to be adopted at the strength deck outside line of openings and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.

1.3 Class notations

1.3.1 In general, ships complying with the requirements of this Chapter will be eligible to be classed **100A1**.

1.3.2 Where a ship has been specially strengthened for heavy cargoes in accordance with the requirements listed in Pt 4, Ch 7, 8.2 Carriage of heavy cargoes, it will be eligible to be classed **100A1 strengthened for heavy cargoes**.

1.3.3 The following additional notations and annotations can be appended to the main class notation giving further detailed description of the loading criteria incorporated into the design:

(a) **RD** (Relative density):

Where a ship has tanks appraised for a maximum permissible relative density greater than 1,025, the notation **RD(specified tank names, density)** may be added.

(b) **WDL(+)** (Weather deck load):

The notation **WDL(+)** may be added. If requested, the maximum permissible weather deck load and extent can be identified in the notation, e.g. **WDL(5,0 t/m² from Aft to Fr. 26)**.

1.3.4 Ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) to 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval.

1.3.5 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations, to which reference should be made.

1.4 Information required

1.4.1 For the information required, see Pt 3, Ch 1, 5 Information required. In addition the following are to be supplied:

- (a) Cargo loadings on decks, hatchways and inner bottom if these are to be in excess of Rule. Where concentrated or point loads occur, their magnitude and points of application are to be defined.
- (b) The maximum pressure head in service on tanks, also details of any double bottom tanks interconnected with side tanks.
- (c) Details of the proposed depths of any partial fillings where water ballast or liquid cargo is intended to be carried in the holds, or large deep tanks.

1.5 Symbols and definitions

1.5.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

$L, B, D,$ = as defined in Pt 3, Ch 1, 6 Definitions
 T and V

k_L, k = higher tensile steel factor, see Pt 3, Ch 2, 1 Materials of construction

e = base of natural logarithms 2,7183

l = overall length of stiffening member, or pillar, in metres, see Pt 3, Ch 3, 3 Structural idealisation

l_e = effective length of stiffening member, or pillar, in metres, see Pt 3, Ch 3, 3 Structural idealisation

t = thickness of plating, in mm

s = spacing of secondary stiffeners, in mm

A = cross-sectional area of stiffening member, in cm²

C = stowage rate, in m³/tonne, see Pt 3, Ch 3, 5 Design loading

C_w = a wave head in metres

= $7,71 \times 10^{-2} L e^{-0,0044 L}$ where L is not to be taken greater than 227

I = inertia of stiffening member, in cm⁴, see Pt 3, Ch 3, 3 Structural idealisation

S = spacing or mean spacing of primary members, in metres

Z = section modulus of stiffening member, in cm³, see Pt 3, Ch 3, 3 Structural idealisation

ρ = relative density (specific gravity) of liquid carried in a tank but is not to be taken less than 1,025.

■ *Section 2* **Materials and protection**

2.1 Materials and grades of steel

2.1.1 Materials and grades of steel are to comply with the requirements of Pt 3, Ch 2 Materials.

2.2 Protection of steelwork

2.2.1 For the protection of steelwork, in addition to the requirements specified in Pt 3, Ch 2, 3 Corrosion protection the requirements of Pt 4, Ch 1, 2.2 Protection of steelwork are to be complied with.

2.2.2 Ceiling is to be laid on the inner bottom under cargo hatchways, but may be omitted provided that the inner bottom plating is increased by 2 mm. In any ship which is regularly to be discharged by grabs, ceiling is to be laid on the inner bottom, and the inner bottom plating increased by 3 mm. Alternatively, the ceiling may be omitted provided that the inner bottom plating is increased in thickness by a minimum of 5 mm. The ceiling is to be 76 mm thick in softwood or 65 mm thick in hardwood, and is to be laid at right angles to the inner bottom stiffening. Where it is intended to use plywood or other forms of ceiling of an approved type instead of planking, the thickness will be considered for each case. Ceiling is also to be laid over bilges, and fitted with portable sections which are to be readily removable. The spaces between the frames at the top of the bilge ceiling are to be closed by steel plates, wood chocks, cement or other suitable means. Inner bottom manhole covers or fittings, where projecting above the inner bottom plating, are to be provided with a steel protection coaming around each manhole, and a wood or steel cover is to be fitted.

2.2.3 Where plated decks are sheathed with wood or approved compositions, the minimum thicknesses given in Pt 4, Ch 1, 4.2 Deck plating, Pt 3, Ch 5, 2 Deck structure and Pt 3, Ch 6, 2 Deck structure may be reduced by 10 per cent for a 50 mm sheathing thickness or five per cent for 25 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck. See also the fire protection requirements relating to deck coverings in the relevant SOLAS Regulations or Pt 6, Ch 3, 4 Refrigeration plant, pipes, valves and fittings as applicable.

2.2.4 Where cargo battens or equivalent are fitted in the holds of dry cargo ships, the descriptive note 'SF' will be entered in the *Register Book*. The battens, when fitted, are to extend from above the upper part of the bilge to the underside of beam knees in the holds, and in all cargo spaces in the 'tween decks and superstructures, up to the underside of beam knees. Wood cargo battens are to be not less than 50 mm in thickness, and the clear space between adjacent rows is, in general, not to exceed 230 mm. The dimensions and spacing of battens made of other materials will be considered. Nets may be adopted in lieu of battens, and other alternative proposals will be specially considered. For arrangements in way of a refrigerated hold, see Pt 6, Ch 3, 4 Refrigeration plant, pipes, valves and fittings.

■ Section 3

Longitudinal strength

3.1 General

3.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 Longitudinal Strength.

3.1.2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to general cargo ships under 120 m.

3.2 Fast cargo ships

3.2.1 The hull section modulus for ships of length, L , between 120 m, and 170 m, and maximum service speed greater than 17,5 knots in association with a bow shape factor, ψ , of more than 0,15, is to comply with the requirements of this sub-Section.

3.2.2 The bow shape factor is defined as:

$$\psi = \frac{100 \sum A_b}{L^{1,5} B}$$

where

a_0 = projection of upper deck at waterline (F.P.), in metres

a_1 = projection of upper deck at waterline (0,1L from F.P.), in metres

a_2 = projection of upper deck at waterline (0,2L from F.P.), in metres

where

b = projection of upper deck at waterline (F.P. to bow line), in metres

$$= \Sigma A_b = \frac{ba_0}{2} + 0,1L(a_1 + a_2) \text{ m}^2$$

See also Figure 1.3.1 Derivation of bow shape factor.

3.2.3 For longitudinal strength requirements, the Rule minimum hull midship section modulus and the distribution of longitudinal material in the forward half-length will be considered. In general, the following requirements are to be complied with:

- The vertical hull midship section modulus, about the horizontal neutral axis, at deck is to be not less than $331Lk\Sigma A_b \text{ cm}^3$, or that required by Pt 3, Ch 4, 5 Hull bending strength, whichever is the greater. ΣA_b is defined in Pt 4, Ch 1, 3.2 Fast cargo ships.
- The horizontal hull midship section modulus, about a vertical axis through the ship centreline, is to be not less than $32,5 L^2 D \text{ cm}^3$.
- In the forward half-length, the hull section modulus is not to be a lesser percentage of the midship value than that shown in Table 1.3.1 Fast cargo ships.
- Any load or ballast condition resulting in a sagging still water bending moment, or a hogging moment less than 80 per cent of the Rule value of still water bending moment, will be specially considered with a view to minimising the compressive stresses in the deck in waves.

Figure 1.3.1: Derivation of bow shape factor

Table 1.3.1: Fast cargo ships

Position	Percentage of midship vertical modulus(modulus about horizontal axis)	Percentage of midship horizontal modulus(modulus about vertical axis)
Station 10 (mid- L_{pp})	100	100
12	98	87
14	95	62
16	81	38
18	44	17
20 (F.P.)	0	0
Note 1. Intermediate values to be obtained by interpolation.		
Note 2. L_{pp} as defined in Pt 3, Ch 1, 6 Definitions.		

3.2.4 For local strength, in general the following requirements are to be complied with:

- Longitudinal deck stiffening is to be carried forward to the fore peak bulkhead or as far forward as practical. Where a long forecastle is fitted, the buckling strength of the proposed structure will be specially considered.
- Substantial web frames in way of deck transverses are to be fitted in the forward half-length. Scantlings of webs and frames are to be based on actual lengths, not 'tween deck heights, and collars are to be fitted at ends of members in way of high shear.
- Scantlings of bottom structure in forward part are to be specially considered.
- Deck and side shell panels forward of $0,5L$ from F.P. are to be examined to establish the critical buckling stress from the following formula:

$$\sigma_c = \frac{\pi^2 E}{12(1 - \nu^2)} \left(\frac{t}{s}\right)^2 K_c \quad \text{N/mm}^2 (\text{kgf/mm}^2)$$

where

s = length of shorter edge, in mm

t = thickness of plating, in mm

E = Young's modulus, in N/mm² (kgf/mm²)

K_c = a factor depending on aspect ratio and boundary restraint

= 4 for longitudinally stiffened plating or as shown in Figure 1.3.2 Plate factor, K_c for transversely stiffened plating

ν = Poisson's ratio (0,3 for steel and aluminium alloy).

Where the buckling stresses, as evaluated, exceed 50 per cent of yield stress, the actual critical buckling stress is given by:

$$\sigma_{ac} = \sigma_o \left(1 - \frac{\sigma_o}{4\sigma_c}\right) \quad \text{N/mm}^2 (\text{kgf/mm}^2)$$

where

σ_{ac} = corrected critical buckling stress, in N/mm² (kgf/mm²)

σ_o = yield stress, in N/mm² (kgf/mm²)

The critical buckling stress from the above formulae must be not less than 176,6 N/mm² (18,0 kgf/mm²) within $0,4L$ amidships, nor less than 147,2 N/mm² (15,0 kgf/mm²) for the deck forward of this, nor less than 117,7 N/mm² (12,0 kgf/mm²) for the side shell between the first and second deck forward of $0,5L$ from F.P. For higher tensile steel plating, the above permissible stresses are to be divided by k .

(e) In order to obtain the necessary critical buckling strength, either of the following is to be applied:

- (i) plate thickness to be increased, or
- (ii) panel aspect ratio to be altered by the fitting of additional panel stiffening.

Figure 1.3.2: Plate factor, K_c

■ Section 4 Deck structure

4.1 General

4.1.1 Longitudinal framing is, in general, to be adopted at the strength deck outside line of openings, but special consideration will be given to proposals for transverse framing. Requirements are given in this Section for longitudinal and transverse framing systems of all deck structure, except decks in way of erections. For erection decks, see Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks.

4.2 Deck plating

4.2.1 The thickness of strength/weather deck plating in the midship region is to comply with the requirements of Table 1.4.1 Strength/weather deck plating. Outside the line of openings the thickness is also to be that necessary to give the hull section modulus required by Pt 3, Ch 4, 5 Hull bending strength.

4.2.2 The thickness of lower deck plating in the midship region is to comply with the requirements of Table 1.4.2 Lower deck plating.

4.2.3 The thickness of the strength deck stringer plate is to be increased by 20 per cent at the ends of bridges, poop and forecastle.

4.2.4 The deck plating thickness and supporting structure are to be suitably reinforced in way of cranes, masts, derrick posts and deck machinery.

4.2.5 Where long, wide hatchways are arranged on lower decks, it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

4.3 Deck stiffening

4.3.1 The scantlings of strength/weather deck longitudinals in the midship region are to comply with the requirements of Table 1.4.3 Strength/weather deck longitudinals.

4.3.2 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with Pt 3, Ch 4, 7 Hull buckling strength.

4.3.3 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements of Table 1.4.4 Cargo and accommodation deck longitudinals.

4.3.4 End connection of longitudinals to bulkheads are to provide adequate fixity and, so far as is practicable, direct continuity of longitudinal strength. Where L exceeds 215 m, the deck longitudinals are to be continuous through transverse structure, including bulkheads, but alternative arrangements will be considered. Higher tensile steel deck longitudinals are to be continuous irrespective of the ship length.

4.3.5 The scantlings of strength/weather, cargo and accommodation deck transverse beams are to comply with the requirements of Table 1.4.5 Strength/weather, cargo and accommodation deck beams.

4.3.6 The end connections of beams are to be in accordance with the requirements of Pt 3, Ch 10, 3 Secondary member end connections.

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.1: Strength/weather deck plating

Location	Minimum thickness, in mm, see also Pt 4, Ch 1, 4.2 Deck plating	
	Longitudinal framing	Transverse framing
(1) Outside line of openings (see Notes 1 and 2)	<p>The greater of the following:</p> <p>(a) $t = 0,001s_1(0,059L_1 + 7) \sqrt{\frac{F_D}{k_L}}$</p> <p>(b) $t = 0,00083s_1 \sqrt{Lk} + 2,5$</p>	<p>The greater of the following:</p> <p>(a) $t = 0,001s_1 f_1 (0,083L_1 + 10) \sqrt{\frac{F_D}{k_L}}$</p> <p>(b) $t = 0,001s_1 \sqrt{Lk} + 2,5$</p>
(2) Inside line of openings (see Note 2)	<p>(b) $t = 0,00083s_1 \sqrt{Lk} + 2,5$</p> <p>but not less than 6,5</p>	<p>$t = 0,00083s_1 \sqrt{Lk} + 1,5$</p> <p>but not less than 6,5</p>
(3) In way of the crown of a tank	<p>$t = 0,004sf \sqrt{\frac{pkh_4}{1,025}} + 3,5$</p> <p>or as (1) or (2), whichever is the greater, but not less than 7,5 mm where $L \geq 90\text{m}$, or 6,5 mm where $L < 90\text{ m}$</p>	
Symbols		
<p>L, k_L, k_t = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions</p> <p>ρ, s, S</p> <p>$f = 1,1 - \frac{s}{2500S}$ but not to be taken greater than 1,0</p> <p>$f_1 = \frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$</p> <p>$h_4$ = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>$s_1 = s$ but is not to be taken less than the smaller of $470 + \frac{L}{0,6}$ mm or 700 mm</p> <p>F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors</p> <p>$L_1 = L$ but need not be taken greater than 190 m.</p>		
<p>Note 1. The thickness derived in accordance with (1) is also to satisfy the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.</p> <p>Note 2. The deck thickness is to be not less than the basic end deck thickness as given in Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure.</p>		

Table 1.4.2: Lower deck plating

Location	Minimum thickness, in mm	
	Second deck	Third or platform decks
(1) Outside line of openings	$t = 0,012s_1 \sqrt{k}$ but not less than 6,5	$t = 0,01s_1 \sqrt{k}$ but not less than 6,5
(2) Inside line of openings	$t = 0,01s_1 \sqrt{k}$ but not less than 6,5	
(3) In way of the crown or bottom of a tank	$t = 0,004sf\sqrt{\frac{\rho kh_4}{1,025}} + K_1$ but not less than 7,5 where $L \geq 90$ m, or 6,5 where $L < 90$ m	
(4) Plating forming the upper flange of underdeck girders	Clear of deck openings, $t = \sqrt{\frac{A_f}{1,8k}}$ In way of deck openings, $t = 1,1 \sqrt{\frac{A_f}{1,8k}}$ Minimum breadth, $b = 760$ mm	
Symbols		
s, S, k, ρ, as defined in Pt 4, Ch 1, 1.5 Symbols and definitions		
b = breadth of increased plating, in mm		
$f = 1,1 - \frac{s}{2500S}$ but not to be taken greater than 1,0		
h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading		
s_1 = s but is not to be taken less than the smaller of $470 + \frac{L}{0,6}$ mm or 700 mm		
A_f = girder face area, in cm ²		
K_1 = 2,5 mm at bottom of tank = 3,5 mm at crown of tank		
Note Where a deck loading exceeds 43,2 kN/m ² (4,4 tonne-f/m ²), the thickness of plating will be specially considered.		

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.3: Strength/weather deck longitudinals

Location	Modulus, in cm ³	Inertia, in cm ⁴
(1) In way of dry cargo spaces, see Note 1		
(a) Outside line of openings	$Z = 0,043 s k h_{T1} l_e^2 F_1$	—
(b) Inside line of openings	$Z = s k (400 h_1 + 0,005 (l_e L_2)^2) \times 10^{-4}$	—
(2) In way of the crown or bottom of a tank	$Z = \frac{0,0113 \rho s k h_4 l_e^2}{b}$ <p>or as (1)(a) or (1)(b) above, whichever is the greater</p>	$I = \frac{2,3}{k} l_e Z$
(3) In way of superstructure	To be specially considered	—
Symbols		
<p>L, s, k_L, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions</p> <p>$b = 1,4$ for rolled or built sections $= 1,6$ for flat bars</p> <p>$c_1 = \frac{60}{225 - 165 F_D}$</p> <p>$d_w =$ depth of longitudinal, in mm</p> <p>$F_1 = 0,25 c_1$</p> <p>$h_1 =$ weather head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>$h_4 =$ tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>$l_e =$ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions, but not to be taken less than 1,5 m</p> <p>$F_D =$ as defined in Pt 3, Ch 4, 5.7 Local reduction factors</p> <p>$h_{T1} = \frac{L_1}{56}$ for Type 'B-60' ships $=$ the greater of $\frac{L_1}{70}$ or 1,20 m for Type 'B' ships</p> <p>$L_1 = L$ but need not be taken greater than 190 m</p> <p>$L_2 = L$ but need not be taken greater than 215 m</p>		
<p>Note 1. Where weather decks are intended to carry deck cargo and the load is in excess of 8,5 kN/m² (0,865 tonne-f/m²), the scantlings of longitudinals may be required to be increased to comply with the requirements for location (1) Table 1.4.4 Cargo and accommodation deck longitudinals using the equivalent design head, for specified cargo loading, for weather decks given in Table 3.5.1 Design heads and permissible cargo loadings in Pt 3, Ch 3 Structural Design .</p>		

General Cargo Ships

Part 4, Chapter 1

Section 4

Note 2. The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are to be complied with. The ratio of the web depth d_w to web thickness t is to comply with the following requirements: (a) Built up profiles and rolled angles:

$$\frac{d_w}{t} \leq 60\sqrt{k_L} \quad \text{(b) Flat bars:}$$

$$\frac{d_w}{t} \leq 18\sqrt{k_L} \quad \text{when continuous at bulkheads}$$

$$\frac{d_w}{t} \leq 15\sqrt{k_L} \quad \text{when non-continuous at bulkheads}$$

Note 3. The web depth of longitudinals, d_w is to be not less than 60 mm.

Table 1.4.4: Cargo and accommodation deck longitudinals

Location	Modulus, in cm ³	Inertia, in cm ⁴
(1) Cargo decks		
(a) $L \geq 90$ m	$Z = sk(5,9L_1 + 25h_2 l_e^2) \times 10^{-4}$	—
(b)	$Z = 0,005s k h_2 l_e^2$	—
(2) Accommodation decks		
(a) $L \geq 90$ m	$Z = sk(5,1L_1 + 25h_3 l_e^2) \times 10^{-4}$	—
(b) $L < 90$ m	$Z = 0,00425s k h_3 l_e^2$ See Note 1	—
(3) In way of the crown or bottom of a tank	As in (1) or (2) as applicable, or $Z = \frac{0,0113 \rho s k h_4 l_e^2}{\gamma}$ whichever is the greater	$I = \frac{2,3}{k} l_e Z$
Symbols		
<p>L, s, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions</p> <p>d_w = web depth of longitudinal, in mm, see Note 2</p> <p>h_2 = cargo head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>h_3 = accommodation head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>l_e = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions, but not to be taken less than 1,5 m</p> <p>L_1 = L but need not be taken greater than 190 m</p> <p>γ = 1,4 for rolled or built sections = 1,6 for flat bars</p>		

General Cargo Ships

Part 4, Chapter 1
Section 4

Note 1. The section modulus of accommodation deck longitudinals need not be taken greater than the value required by location (1)(a), in Table 1.4.3 Strength/weather deck longitudinals.

Note 2. The web depth of longitudinals, d_w , to be not less than 60 mm.

Table 1.4.5: Strength/weather, cargo and accommodation deck beams

Location	Modulus, in cm^3	Inertia, in cm^4
(1) Strength/weather decks	The lesser of the following: (a) $Z = (K_1 K_2 TD + K_3 B_1 s h_1 l_e^2) k \times 10^{-4}$ (b) $Z = 2K_3 B_1 s k h_1 l_e^2 \times 10^{-4}$	—
(2) Cargo decks	$Z = (400K_1 TD + 38,8s h_2 l_e^2) k \times 10^{-4}$	—
(3) Accommodation decks	$Z = (530K_1 TD + 38,8s h_3 l_e^2) k \times 10^{-4}$	—
(4) In way of the crown or bottom of a tank	As (1), (2) or (3) as applicable, or $Z = \frac{0,0113p s k h_4 l_e^2}{\gamma}$ whichever is the greater	$I = \frac{2,3}{k} l_e Z$

B, D, T, s, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions

d_w = depth of beam, in mm

h_1 = weather deck head in metres, see Pt 3, Ch 3, 5 Design loading

h_2 = cargo head in metres, see Pt 3, Ch 3, 5 Design loading

h_3 = accommodation head in metres, see Pt 3, Ch 3, 5 Design loading

h_4 = tank head in metres, see Pt 3, Ch 3, 5 Design loading

l_e as defined in Pt 4, Ch 1, 1.5 Symbols and definitions, but to be taken as not less than 1,83 m

B_1 = B , but need not be taken greater than 21,5 m

K_1 = a factor dependent on the number of decks (including poop and bridge superstructures) at the position of the beam under consideration:

- = 1 deck 20,0
- = 2 decks 13,3
- = 3 decks 10,5
- = 4 or more 9,3

K_2 = a factor dependent on the location of the beam:

- = at short bridge and poops 133
- = elsewhere 530

K_3 = a factor dependent on the location of the beam:

= elsewhere 3,3

= span adjacent to the ship side 3,6

γ = 1,4 for rolled or built sections

= 1,6 for flat bars

Note 1. Where weather decks are intended to carry deck cargo and the load is in excess of $8,5 \text{ kN/m}^2$ ($0,865 \text{ tonne-f/m}^2$), the scantlings of beams may be required to be increased to comply with the requirements for location (2) using the equivalent design head, for specified cargo loading, for weather decks given in Table 3.5.1 Design heads and permissible cargo loadings.

Note 2. The web depth of beams, d_w , is to be not less than 60 mm.

4.4 Deck supporting structure

4.4.1 **Girders and transverses** supporting deck longitudinals and beams, also hatch side girders and hatch end beams, are to comply with the requirements of Table 1.4.6 Deck girders, transverses and hatch beams. In general, transverses, webs or frames of increased scantlings, see Table 1.6.3 Shell framing (transverse), are to be arranged in way of hatch end beams and deck transverses, and these are to be in line with the double bottom floors where practicable. Equivalent transverse ring scantling arrangements will be considered.

4.4.2 **Transverses** supporting deck longitudinals are, in general, to be spaced not more than 3,8 m apart where the length, L , is 100 m or less, and $(0,006L + 3,2)$ m apart where L is greater than 100 m.

4.4.3 The web thickness, stiffening arrangements and end connection of primary supporting members are to be in accordance with Pt 3, Ch 10, 4 Construction details for primary members.

4.4.4 Where a girder is subject to concentrated loads, such as pillars out of line, the scantlings are to be suitably increased. Also, where concentrations of loading on one side of the girder may occur, the girder is to be adequately stiffened against torsion. Reinforcements may be required in way of localised areas of high stress.

4.4.5 **Pillars** are to comply with the requirements of Table 1.4.7 Pillars.

4.4.6 Pillars are to be fitted in the same vertical line wherever possible, and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

4.4.7 Tubular and hollow square pillars are to be attached at their heads to plates supported by efficient brackets, in order to transmit the load effectively. Doubling or insert plates are to be fitted to the inner bottom under the heels of tubular or hollow square pillars, and to decks under large pillars. The pillars are to have a bearing fit and are to be attached to the head and heel plates by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be well distributed by means of longitudinal and transverse brackets.

4.4.8 In double bottoms under widely spaced pillars, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Manholes are not to be cut in the floors and girders below the heels of pillars. Where longitudinal framing is adopted in the double bottom, equivalent stiffening under the heels of pillars is to be provided, and where the heels of pillars are carried on a tunnel, suitable arrangements are to be made to support the load.

4.4.9 Where pillars are fitted inside tanks or under watertight flats, the tensile stress in the pillar and its end connections is not to exceed 108 N/mm^2 ($11,0 \text{ kgf/mm}^2$) at the test heads. In general, such pillars should be of built sections, and end brackets may be required.

4.4.10 Pillars are to be fitted below deckhouses, windlasses, winches, capstans and elsewhere where considered necessary.

4.4.11 **Non-watertight pillar bulkheads** are to comply with the requirements of Table 1.4.8 Non-watertight pillar bulkheads.

4.4.12 **Cantilevers** and their supporting frames are to comply with the requirements of Table 1.4.9 Cantilever beams.

4.5 Deck openings

4.5.1 The corners of main cargo hatchways in the strength deck within 0,5L amidships are to be elliptical, parabolic or rounded, with a radius generally not less than $\frac{1}{24}$ of the breadth of the opening. Rounded corners are to have a minimum radius of 300 mm if the deck plating extends inside the coaming, or 150 mm if the coamings are welded to the inner edge of the plating in the form of a spigot. Where elliptical corners are arranged, the major axis is to be fore and aft, the ratio of the major to minor axis is to be not less than 2 to 1 nor greater than 2,5 to 1, and the minimum half-length of the major axis is to be defined by l_1 in Figure 1.4.5 Elliptical and parabolic corners. Where parabolic corners are arranged, the dimensions are also to be as shown in Figure 1.4.5 Elliptical and parabolic corners.

4.5.2 Where the corners of large openings in the strength deck are parabolic or elliptical, insert plates are not required. For other shapes of corner, insert plates of the size and extent shown in Figure 1.4.6 Insert plates for large openings will, in general, be required. The required thickness of the insert plate is to be not less than 25 per cent greater than the adjacent deck thickness, outside line of openings with a minimum increase of 4 mm. The increase need not exceed 7 mm.

4.5.3 Welded attachments close to or on the free edge of the hatch corner plating are to be avoided (e.g. welded protection strips or shedder plates) and the butt welds of corner insert plates to the adjacent deck plating are to be located well clear of butts in the hatch coaming.

4.5.4 Openings in the strength deck outside the line of hatch openings are to be kept to the minimum number consistent with operational requirements. Openings are to be arranged clear of hatch corners and, so far as possible, clear of one another. Where, within 0,4L amidships, deck openings have a total breadth or shadow area breadth, in one transverse section that exceeds the limitation given in Pt 3, Ch 3, 3.4 Calculation of hull section modulus and Pt 3, Ch 3, 3.4 Calculation of hull section modulus, compensation will be required to restore the excess. This is generally to be arranged by increasing the deck plate thickness, but other proposals will be considered. Plate panels in which openings are cut are to be adequately stiffened, where necessary, against compression and shear buckling. The corners of all openings are to be well rounded and the edges smooth.

Table 1.4.6: Deck girders, transverses and hatch beams

Location and arrangements	Modulus, in cm ³	Inertia, in cm ⁴
(1) Girders and transverses in way of dry cargo spaces and clear of hatch openings:	See also Note	
(a) supporting up to three point loads	Z to be determined from calculations using Note and stress $\frac{123,5}{k}$ N/mm ² $\left(\frac{12,6}{k}$ kgf/mm ²) and assuming fixed ends.	$I = \frac{1,85}{k} l_e Z$
(b) supporting four or more point loads or a uniformly distributed load	$Z = 4,75k S H_g l_e^2$	
(2) Hatch side girders in way of dry cargo spaces at weather decks (with deep coamings):		
(a) supporting up to three point loads	Z to be determined from calculations using Note and stress $\frac{100,4}{k}$ N/mm ² $\left(\frac{10,25}{k}$ kgf/mm ²) and assuming fixed ends	$I = \frac{2,3}{k} l_e Z$
(b) supporting four or more point loads or a uniformly distributed load	$Z = 5,85k S_1 H_g l_e^2$	
(3) Hatch side girders in way of dry cargo spaces at lower decks (without deep coamings):		
(a) supporting up to three point loads	Z to be determined from calculations using stress $\frac{112,5}{k}$ N/mm ² $\left(\frac{11,5}{k}$ kgf/mm ²)	$I = \frac{1,85}{k} l_e Z$

Part 4, Chapter 1

Section 4

(b) supporting four or more point loads or a uniformly distributed load	$Z = 5,20kS_1H_gl_e^2$	
(4) Hatch end beams in way of dry cargo spaces and supported at centreline, see Figure 1.4.1 Hatch end beam arrangements:		
(a) In association with longitudinal framing when there is no transverse between the hatch end beam and adjacent transverse bulkhead or equivalent supporting structure	$Z = 19k K_1 H_g l_e S_1 l_1 + 2,37k S_e H_g l_e^2$	$I = \frac{2,8}{k} l_e Z$
(b) In association with longitudinal framing where there is one or more transverse between the hatch end beam and adjacent transverse bulkhead or equivalent supporting structure	$Z = 19k K_1 H_g l_e (S_1 l_1 + S_2 l_2)$	
(c) In association with transverse framing when the hatch end beam supports the hatch side girder and in line girder only	$Z = 19k K_1 H_g l_e (S_1 l_1 + S_3 l_3)$	
(d) In association with transverse framing when the hatch end beam supports the hatch side girder, an in line girder and an additional girder between the hatch side and the centreline	$Z = 19k H_g l_e (K_1 (S_1 l_1 + S_4 l_4) + K_2 S_5 l_5)$	
(5) Girders and transverses in way of the crown or bottom of a tank	$Z = 11,7p k h_4 S l_e^2$	$I = \frac{2,8}{k} l_e Z$
Symbols		
S, l_e , k, p as defined in Pt 4, Ch 1, 1.5 Symbols and definitions	K_1, K_2 = factors, dependent on the girder arrangements, as follows:	
h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading	$\frac{B_h}{2l_e}$ or $\frac{X}{l_e}$	K_1 or K_2
l_1, l_2, l_3, l_4, l_5 , in metres, as indicated in Figure 1.4.1 Hatch end beam arrangements	0,2	0,143
	0,3	0,177
B_h = breadth of hatchway, in metres, as used to determine K_1	0,4	0,191
	0,5	0,187
	0,6	0,179
	0,7	0,169
H_g = weather head h_1 , or cargo head h_2 , or accommodation head h_3 , in metres, as defined in Pt 3, Ch 3, 5 Design loading, whichever is applicable	0,8	0,141
	0,9	0,085
	1,0	0,000
	$S_e, S_1, S_2, S_3, S_4, S_5$, in metres as indicated in Figure 1.4.1 Hatch end beam arrangements	
X = distance, in metres, from centreline of ship to an additional girder, if fitted, as shown in Figure 1.4.1 Hatch end beam arrangements, as used to determine K_2		
NOTE		
In single deck ships the section modulus of deck transverses is to be increased by 15 per cent.		

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.7: Pillars

Symbols	Parameter	Requirement
<p>b = breadth of side of a hollow rectangular pillar or breadth of flange or web of a built or rolled section, in mm</p> <p>d_p = mean diameter of tubular pillars, in mm</p>	(1) Cross-sectional area of all types of pillar	$A_p = \frac{kP}{12,36 - 51,5 \frac{l_e}{r\sqrt{k}}} \text{ cm}^2$ $\left(A_p = \frac{kP}{1,26 - 5,25 \frac{l_e}{r\sqrt{k}}} \text{ cm}^2 \right)$ <p>See Note</p>
<p>k = local scantling higher tensile steel factor, see Pt 3, Ch 2, 1.2 Steel, but not less than 0,72</p> <p>l = overall length of pillar, in metres</p> <p>l_e = effective length of pillar, in metres, and is taken as: for hold pillars 0,65 l for 'tween deck pillars 0,80 l</p> <p>l_p = distance, in metres, between centres of the two adjacent spans of girder, or transverse, supported by the pillar</p>	(2) Minimum wall thickness of tubular pillars	<p>The greater of the following:</p> <p>(a) $t = \frac{P}{d_p \left(0,392 - 1,53 \frac{l_e}{r} \right)} \text{ mm}$</p> <p>(a) $\left(t = \frac{P}{d_p \left(0,04 - 0,156 \frac{l_e}{r} \right)} \right) \text{ mm}$</p> <p>(b) $t = \frac{d_p}{40} \text{ mm}$</p> <p>but not to be less than</p> <p>(c) $t = 5,5 \text{ mm}$ where $L < 90 \text{ m}$, or $= 7,5 \text{ mm}$ where $L \geq 90 \text{ m}$</p>
<p>r = least radius of gyration of pillar cross-section, in mm, and may be taken as: $r = 10 \sqrt{\frac{I}{A_p}} \text{ mm}$</p> <p>$A_p$ = cross-sectional area of pillar, in cm^2</p> <p>C, S as defined in Pt 4, Ch 1, 1.5 Symbols and definitions</p> <p>H_g as defined in Table 1.4.6 Deck girders, transverses and hatch beams</p> <p>I = least moment of inertia of cross-section, in cm^4</p>	(3) Minimum wall thickness of hollow rectangular pillars or web plate thickness of I or channel sections	<p>The lesser of (b) and (c) and not to be less than (a):</p> <p>(a) $t = \frac{P}{b \left(0,5 - 1,95 \frac{l_e}{r} \right)} \text{ mm}$</p> <p>(a) $\left(t = \frac{P}{b \left(0,05 - 0,2 \frac{l_e}{r} \right)} \right) \text{ mm}$</p> <p>(b) $t = \frac{br}{600l_e} \text{ mm}$</p> <p>(c) $t = \frac{b}{55} \text{ mm}$</p> <p>but to be not less than</p> <p>$t = 5,5 \text{ mm}$ where $L < 90 \text{ m}$, or $= 7,5 \text{ mm}$ where $L \geq 90 \text{ m}$</p>

General Cargo Ships

Part 4, Chapter 1

Section 4

<p>P = load, in kN (tonne-f), supported by the pillar and is to be taken as</p> $\frac{9,81SH}{c} \frac{g}{p} + P_a$ $\left(\frac{SH}{c} \frac{g}{p} + p_a \right)$ <p>but not less than 19,62 kN (2 tonne-f)</p>	<p>(4) Minimum thickness of flanges of angle or channel sections</p>	<p>The lesser of the following:</p> <p>(a) $t_f = \frac{br}{200l_e}$ mm</p> <p>(b) $t_f = \frac{b}{18}$ mm</p>
<p>P_a = load, in kN (tonne-f), from pillar or pillars above (zero if no pillars over)</p>	<p>(5) Minimum thickness of flanges of built or rolled I sections</p>	<p>The lesser of the following:</p> <p>(a) $t_f = \frac{br}{400l_e}$ mm</p> <p>(b) $t_f = \frac{b}{36}$ mm</p>
<p>Note As a first approximation A_p may be taken as $\frac{\sqrt{kP}}{9,32} \left(\frac{\sqrt{kP}}{0,95} \right)$ and the radius of gyration estimated for a suitable section having this area.</p> <p>Note If the area calculated using this radius of gyration differs by more than 10 per cent from the first approximation, a further calculation using the radius of gyration corresponding to the mean area of the first and second approximation is to be made.</p>		

4.5.5 Openings in the strength deck outside the line of hatch openings having a stress concentration factor in excess of 2,4 will require edge reinforcements in the form of a spigot of adequate dimensions, but alternative arrangements will be considered. The area of any edge reinforcement which may be required is not to be taken into account in determining the required sectional area of compensation for the opening. Alternatively, the shape of the opening is to be such that a stress concentration factor of 2,4 is not exceeded. In this respect, reinforcement will not in general, be required in way of:

- (a) elliptical openings having their major axis fore and aft and a ratio of length to breadth not less than 2 to 1, or
- (b) openings of other shapes provided that it has been shown by suitable tests that the stress concentration factor does not exceed 2,4.

Table 1.4.8: Non-watertight pillar bulkheads

Parameter	Requirement	
	Ships with $L < 90$ m	Ships with $L \geq 90$ m
(1) Minimum thickness of bulkhead plating	5,5 mm in holds and 'tween decks	7,5 mm in holds
		6,5 mm in 'tween decks
(2) Maximum stiffener spacing	1500 mm	1500 mm
(3) Minimum depth of stiffeners or corrugations	100 mm in holds	150 mm in holds
	75 mm in 'tween decks	100 mm in 'tween decks
(4) Cross-sectional area (including plating) for rolled, built or swedged stiffeners supporting beams, longitudinals, girders or transverses	(a) Where $\frac{s}{t} \leq 80$	$A = A_1$
	(b) Where $\frac{s}{t} \geq 120$	$A = A_2$
	(c) Where $80 < \frac{s}{t} < 120$	A is obtained by interpolation between A_1 and A_2
(5) Cross-sectional area (including plating) for symmetrical corrugation	(a) Where $\frac{b}{t_p} \leq \frac{750 \lambda l_e}{(\lambda + 0,25)r}$	$A = A_1$
	(b) Where $\frac{b}{t_p} > \frac{750 \lambda l_e}{(\lambda + 0,25)r}$	$A = A_2$
Symbols		
<p>d_w, t_p, b, c as defined in Pt 3, Ch 3, 3 Structural idealisation</p> <p>r = radius of gyration, in mm, of stiffener and attached plating</p> <p>= $10\sqrt{\frac{I}{A}}$ mm for rolled, built or swedged stiffeners</p> <p>= $d_w\sqrt{\frac{3b+c}{12(b+c)}}$ mm for symmetrical corrugation</p> <p>I = moment of inertia, in cm^4, of stiffener and attached plating</p> <p>s = spacing of stiffeners, in mm</p> <p>A = cross-sectional area, in cm^2, of stiffener and attached plating</p> <p>$A_1 = \frac{P}{12,36 - 51,5\frac{e}{r}} \text{ cm}^2$</p> <p>= $\left(A_1 = \frac{P}{1,26 - 5,25\frac{e}{r}} \text{ cm}^2 \right)$</p> <p>= As a first approximation A_1 may be taken as</p> <p>= $\frac{P}{9,32} \left(\frac{P}{0,95} \right)$</p>		

$$A_2 = \frac{P}{4,9 - 14,7 \frac{l_e}{r}} \text{ cm}^2$$

$$= \left(A_2 = \frac{P}{0,5 - 1,5 \frac{l_e}{r}} \text{ cm}^2 \right)$$

= As a first approximation A_2 may be taken as

$$= \frac{P}{3,92} \left(\frac{P}{0,4} \right)$$

= P, l_e as defined in Table 1.4.7 Pillars

$$\lambda = \frac{b}{c}$$

4.5.6 Lower deck openings should be kept clear of main hatch corners and the areas of high stress, so far as possible. Compensation will not, in general, be required unless the total width of openings in any frame space, or between any two transverses, exceeds 15% per cent of the original effective plating width. The requirements of Pt 4, Ch 1, 4.5 Deck openings also apply to lower deck openings except that:

- (a) the thickness of inserts, if required, for the second deck hatch corners is to be 2,5 mm greater than the deck thickness,
- (b) inserts will not generally be required for hatch corners on third decks, platform decks and below, and
- (c) reinforcement will not generally be required for circular openings, provided that the plate panels in which they are situated are otherwise adequately stiffened against compression and shear buckling.

4.5.7 All openings are to be adequately framed; attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided. Arrangements in way of corners and openings are to be such as to minimise the creation of stress concentrations. Where a deck longitudinal is cut, compensation is to be arranged to ensure full continuity of strength.

Table 1.4.9: Cantilever beams

Location and supporting arrangements	Required modulus, in cm ³ , see Notes	
	Cantilever beam	Supporting frame
(1) Any position - no support from end girders	$Z_o = 8,67k M_o (Z_o = 85k M_o)$	$Z_v = \frac{v}{H_1} \left(\frac{fZ_o}{u} - kZ_t \right)$
(2) At hatch side - uniform loading, partial support received from hatch side girder, see Figure 1.4.3 Section moduli of hatch end beams :		
(a) Hatch side girder supported by Rule hatch end beams or pillars at hatch corners	$Z_u = 0,9Z_o - kG$	$Z_v = \frac{v}{H_1} \left(\frac{fZ_u}{u} - kZ_t \right)$
(b) Hatch side girder supported by end bulkheads of hold - no Rule hatch end beams or pillars	Z_u as in (a) or the following formula, whichever is the greater: $\left(\frac{n+1}{n} \right) \left(0,45 \left(1 + \frac{1}{\beta} \right) Z_o - k\beta G - (1 - \beta)kE \right)$	
(c) No transverse bulkheads between hatchways, no Rule hatch end beams or pillars, see Notes	Z_u as in (a) or the following formula, whichever is the greater: $\left(\frac{n+1}{n} \right) \left(\frac{Z_o}{\beta} - 0,5kE \right)$	
(d) At hatch side - concentrated loading	Z_u as in (a), (b) or (c), whichever is applicable, or as the following formula, whichever is the greater: $Z_o - kG_1$	
Case (1) or (2)	Required inertia, in cm ⁴	
	$I_u = \frac{9u}{k} Z_u$	—
Note 1. Where a transverse bulkhead is fitted at only one end of a hatchway the section modulus of cantilever beams is to be a mean of the values obtained from (2)(b) and (2)(c).		
Note 2. Where only cantilevers in the length of a hatchway consist of two or three close together at the mid-length of hatchway, their modulus is to be determined by calculating the modulus of a single cantilever at mid-length and dividing this by the actual number of cantilevers.		
Note 3. If a negative value is obtained for the required section modulus, cantilevers are not necessary for the arrangement considered.		
Note 4. In calculating the actual section modulus of a cantilever or supporting frame, the effective area of attached plating is to be as given in Pt 3, Ch 3, 3 Structural idealisation. Intermediate beams or frames within the effective breadth may be included in the calculation.		
Note 5. Rule hatch end beams are those with scantlings determined from Table 1.4.6, assuming that the hatch side girder has a span between hatch end beams.		
Note 6. The section modulus of cantilever beams is to be not less than that determined from Table 1.4.5 Strength/weather, cargo and accommodation deck beams for beams in the same position.		
Note 7. The section modulus of side frames, pillars or pillar bulkhead stiffeners supporting cantilevers is to be not less than that required for ordinary side frames, pillars or pillar bulkhead stiffeners, as determined from the appropriate Sections of the Rules.		

Note 8. The scantlings of the cantilever bracket within the shaded area shown in Figure 1.4.2 Deck cantilevers are to be as follows:

(a) Where tripping brackets are not fitted:

$$t = (0,0075d_c + 5)\sqrt{k} \text{ mm}$$

$$A_f = \left(\frac{27Z_d}{e} \left(1 - \frac{e}{1420f} \right) - \frac{et}{300} \right) k \text{ cm}^2$$

(b) Where tripping brackets are fitted at the positions indicated in Figure 1.4.2 Deck cantilevers:

$$t = (0,0075d_c + 5)\sqrt{k} \text{ mm}$$

$$A_f = \left(\frac{20Z_d}{e} \left(1 - \frac{e}{1420f} \right) - \frac{et}{200} \right) k \text{ cm}^2$$

In general the radius at the throat of the cantilever bracket is to be not less than d_c .

Note 9. The cantilever beam and supporting frame face plates may be gradually tapered from the limits of the shaded area shown in Figure 1.4.2 Deck cantilevers. The web depth of the supporting frame may be tapered to a minimum of $0,5d_f$ at the base.

Note 10. Where the web thickness of cantilevers or supporting frames is less than $\frac{d_w}{60\sqrt{k}}$ transverse web stiffeners are to be fitted spaced approximately $1,5d_w$ apart. In no case is the web thickness outside the limits of the cantilever brackets to be less than $\frac{d_w}{85\sqrt{k}}$

Where stiffeners are fitted parallel to the face plates, the stiffening arrangements will be specially considered.

Symbols

f = overall length of cantilever, in metres	Where there is no centreline support:
k = higher tensile steel factor as defined in Pt 4, Ch 1, 1.5 Symbols and definitions	d_c = web depth of cantilever, at root of bracket, in mm, see Figure 1.4.2 Deck cantilevers
l_b = distance, in metres, between transverse bulkheads, see Figure 1.4.4 Deck supporting structure. Where there is no bulkhead midway between hatchways, l_b is to be measured to a point midway between hatchways	d_f = web depth of frame at root of bracket, in mm, see Figure 1.4.2 Deck cantilevers
l_h = length of hatchway, in metres, see Figure 1.4.4 Deck supporting structure	d_w = web depth of cantilever or frame, in mm
C = cargo stowage rate in m ³ /tonne as defined in Pt 3, Ch 3, 5 Design loading, and is to be taken as 1,39 m ³ /tonne unless specified otherwise	e = web depth, in mm, as shown in Figure 1.4.2 Deck cantilevers
Z_a = section modulus, in cm ³ , of hatch side girder which is to be not less than that calculated from Table 1.4.6 Deck girders, transverses and hatch beams, taking the span between cantilevers	n = number of cantilevers between the hatch end beams

Z_b = mean of section moduli, in cm^3 , of longitudinal girders in line with hatch side girder (Z_b is to be taken not greater than Z_a)

$$Z_d = \frac{fZ_u}{u}$$

Z_o = section modulus, in cm^3 , of cantilever beam, not supported by end girder, at distance u from outer end

Z_t = section modulus, in cm^3 , of frame or stiffener above cantilever, see Figure 1.4.2 Deck cantilevers. (Where there is no frame or stiffener above cantilever $Z_t = 0$)

Z_u = section modulus, in cm^3 , of cantilever beam, partially supported by hatch side girder at end, at distance u from outer end

Z_v = section modulus, in cm^3 , of supporting frame, at distance v from lower end

Z_1, Z_2, Z_3 = mean of section moduli, in cm^3 , of hatch end beams calculated for the positions shown in Figure 1.4.3 Section moduli of hatch end beams. Z_2 is to be taken as the smaller modulus of the two sections adjacent to the hatch side

$$\beta = \frac{l_h}{l_b}$$

E is determined as follows:

When centreline bulkheads or pillars are fitted:

$$E = \frac{4}{n+1} \left((Z_1 + Z_2) + \frac{2u}{B_h} (Z_2 + Z_3) \right)$$

t = thickness of cantilever bracket, in mm

u, v = lever arms, in metres, as shown in Figure 1.4.2 Deck cantilevers

A_f = sectional area, in cm^2 , of cantilever bracket face plate

B_h = breadth of hatch, in metres, see Figure 1.4.4 Deck supporting structure

$$E = \frac{4}{n+1} (Z_1 + Z_2)$$

$$G = \frac{7u}{(n+1)l_h} (Z_a + Z_b)$$

$$G_1 = \frac{3,5uZ_a}{S_c}$$

H_1, H_2, H_3 = mean height of hold or 'tween decks, in metres, as shown in Figure 1.4.2 Deck cantilevers. At weather decks, H_2 and H_3 are to be taken equivalent to the weather head h_1 as defined in Pt 3, Ch 3, 5 Design loading

M_o = bending moment, in kN m (tonne-f m), on the cantilever beam due to the load supported by a single cantilever. This bending moment is to be calculated about an axis at a distance u from the end. For hatch side cantilevers with uniformly distributed loading this will equal

$$= \frac{4,9S_c u}{C} (H_2 B_h + H_3 u)$$

$$= \left(\frac{0,5S_c u}{C} (H_2 B_h + H_3 u) \right)$$

S_c = spacing of cantilevers, in metres, see Figure 1.4.4 Deck supporting structure

■ Section 5

Shell envelope plating

5.1 General

5.1.1 Requirements are given in this Section for longitudinal or transversely framed shell plating, and attention is drawn to the requirements of Pt 4, Ch 1, 6.1 General. In ships with a transversely framed bottom construction, the bottom shell plating is, in general, to be reinforced with additional continuous, or intercostal, longitudinal stiffeners, see *also* Pt 4, Ch 1, 7.1 General. Alternative arrangements will be considered.

5.1.2 For ships intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

5.2 Keel

5.2.1 The cross-sectional area and thickness of bar keels, and the width and thickness of plate keels, are to comply with the requirements of Table 1.5.1 Bar and plate keels. Forged or rolled bar keels are also to comply with the material requirements of Ch 3 Rolled Steel Plates, Strip, Sections and Bars of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

Table 1.5.1: Bar and plate keels

Item and parameter	Requirement
(1) Bar keels:	
Cross-sectional area	$A = (1,8L - 16) \text{ cm}^2$
Thickness	$t = (0,6L + 8) \text{ mm}$
(2) Plate keels:	
Breadth	$b = 70B \text{ mm}$ but need not exceed 1800 mm and is not to be less than 750 mm
Thickness	$t = (t_1 + 2) \text{ mm}$ where t_1 is as in location (1) in Table 1.5.2, using the spacing in way of the keel plate t is to be taken not less than the adjacent bottom shell thickness
Symbols	
L, B as defined in Pt 4, Ch 1, 1.5 Symbols and definitions	
b = breadth of keel, in mm	
t = thickness of keel, in mm	
A = cross-sectional area, in cm^2	

5.3 Bottom shell and bilge

5.3.1 In the midship region the thickness of bottom shell plating to the upper turn of bilge is to be that necessary to give the hull section modulus required by Pt 3, Ch 4, 5 Hull bending strength, and is to be not less than the minimum values given by Table 1.5.2 Bottom shell and bilge plating.

5.4 Side shell

5.4.1 In the midship region, the thickness of side shell and sheerstrake plating including the sides of bridge superstructures is to be not less than the values given by Table 1.5.3 Side shell plating, but may be required to be increased locally on account of high shear forces in accordance with Pt 3, Ch 4, 6 Hull shear strength.

5.4.2 Sea inlets, or other openings, are to have well rounded corners and so far as possible, are to be kept clear of the bilge radius. Openings on, or near to, the bilge radius are to be elliptical. The thickness of sea inlet box plating is to be the same as the adjacent shell, but not less than 12,5 mm and need not exceed 25 mm.

5.4.3 Where a rounded sheerstrake is adopted the radius should, in general, be not less than 15 times the thickness.

5.4.4 The sheerstrake thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side. In the case of a bridge superstructure exceeding $0,15L$, the side plating at the ends of the superstructure is also to be increased by 25 per cent and tapered gradually into the upper deck sheerstrake.

5.4.5 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale or any deck openings situated outside the line of the main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

Table 1.5.2: Bottom shell and bilge plating

Location	Minimum thickness, in mm, see also Pt 4, Ch 1, 5.3 Bottom shell and bilge	
	Longitudinal framing	Transverse framing

Table 1.5.3: Side shell plating

Location	Thickness, in mm, see also Pt 4, Ch 1, 5.4 Side shell	
	Longitudinal framing	Transverse framing
(1) Side shell clear of sheerstrake, see Notes 1, 2, 4 and 5	(a) Above $\frac{D}{2}$ from base: The greater of the following: (i) $t = 0,001s_1(0,059L_1 + 7)\sqrt{\frac{F_D}{k_L}}$ (ii) $t = 0,0042s_1\sqrt{h_{T1}k}$	(a) Within $\frac{D}{4}$ from the gunwale: The greater of the following: (i) $t = 0,00085s_1f_1(0,083L_1 + 10)\sqrt{\frac{F_D}{k_L}}$ (ii) $t = 0,0042s_1\sqrt{h_{T1}k}$
	(b) At upper turn of bilge, see Note 3: The greater of the following: (i) $t = 0,001s_1(0,059L_1 + 7)\sqrt{\frac{F_M}{k_L}}$ (ii) $t = 0,0054s_1\sqrt{\frac{h_{T2}k}{2 - F_B}}$	(b) Within $\frac{D}{4}$ from mid-depth: The greater of the following: (i) $t = 0,001s_1(0,059L_1 + 7)\sqrt{\frac{F_M}{k_L}}$ (ii) $t = 0,0051s_1\sqrt{h_{T1}k}$
	(c) Between upper turn of bilge and $\frac{D}{2}$ from base: The greater of the following: (i) t from (b)(i) (ii) t from interpolation between (a)(ii) and (b)(ii)	(c) Within $\frac{D}{4}$ from base (excluding bilge plating) see Note 3: The greater of the following: (i) $t = 0,00085s_1f_1(0,083L_1 + 10)\sqrt{\frac{F_B}{k_L}}$ (ii) $t = 0,0056s_1\sqrt{\frac{h_{T2}k}{1,8 - F_B}}$
(2) Sheerstrake, see Notes 1, 2 and 5	The greater of the following: (i) $t = 0,001s_1(0,059L_1 + 7)\sqrt{\frac{F_D}{k_L}}$ (ii) $t = 0,00083s_1\sqrt{Lk} + 2,5$ but t is to be not less than the thickness of the adjacent side plating	The greater of the following: (i) $t = 0,001s_1f_1(0,083L_1 + 10)\sqrt{\frac{F_D}{k_L}}$ (ii) $t = 0,001s_1\sqrt{Lk} + 2,5$ but t is to be not less than the thickness of the adjacent side plating
Symbols		
<p>L, D, T, S, s, k_L, k, as defined in Pt 4, Ch 1, 1.5 Symbols and definitions</p> <p>C_w is as defined in Pt 4, Ch 1, 1.5 Symbols and definitions.</p> <p>Where $L > 227$ m, C_w is not to be taken less than 6,446 m</p> $f_1 = \frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$ $h_{T1} = T + C_w \text{ m but need not be taken greater than } 1,36T$ $h_{T2} = T + 0,5C_w \text{ m but need not be taken greater than } 1,2T$		

$s_1 = s$, but is not to be taken less than the smaller of

$$470 + \frac{L}{0,6} \text{ mm or } 700 \text{ mm}$$

$F_D, F_B =$ as defined in Pt 3, Ch 4, 5.7 Local reduction factors

$F_M =$ the greater of F_D or F_B

$L_1 = L$, but need not be taken greater than 190 m

Note 1. The thickness is also to satisfy the buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength.

Note 2. The thickness of side shell or sheerstrake is to be not less than the basic shell end thickness for taper, as given in Pt 3, Ch 5, 3 Shell envelope plating and Pt 3, Ch 6, 3 Shell envelope plating. The width of the sheerstrake (where of different thickness from the side shell) is to be not less than that required by Table 2.2.1 Material classes and grades in Pt 3, Ch 2 Materials.

Note 3. The thickness of side shell need not exceed that determined from Table 1.5.2 Bottom shell and bilge plating for bottom shell, but using the spacing of side frames or longitudinals.

Note 4. Outside the Rule minimum region of higher tensile steel as defined in Pt 3, Ch 3, 2.6 Vertical extent of higher tensile steel the value of k_L may be taken as 1,0.

Note 5. For the expressions contained in (i), where separate maximum sagging and hogging still water bending moments are assigned, F_D may be based on the sagging moment and F_B on the hogging moment.

■ Section 6

Shell envelope framing

6.1 General

6.1.1 Longitudinal framing is, in general, to be adopted at the bottom, but special consideration will be given to proposals for transverse framing in this region. Transverse or longitudinal framing can be adopted for the side shell. Requirements are given in this Section for longitudinal and transverse framing systems.

6.1.2 End connections of longitudinals to bulkheads are to provide adequate fixity and, so far as practicable, direct continuity of longitudinal strength. Where L exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length, see *also* Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members.

6.1.3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and $0,8D_2$ above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations, see *also* Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members.

6.1.4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and $0,8D_2$ above the base line. Particular attention should be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations, see *also* Pt 4, Ch 1, 6.2 Longitudinal stiffening.

6.1.5 For ships intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

6.2 Longitudinal stiffening

6.2.1 For non-**CSR** tankers, bulk carriers and ore carriers (see Pt 1, Ch 2, 2.3 Class notations (hull)) the scantlings of bottom and side longitudinals in the midship region are to comply with the requirements given in Table 1.6.2 (b) Shell framing (longitudinal). In general other ships are to comply with Table 1.6.1 (a) Shell framing (longitudinal).

6.2.2 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with Pt 3, Ch 4, 7 Hull buckling strength.

6.2.3 Where higher tensile steel asymmetrical sections are adopted in double bottom tanks which are interconnected with double skin side tanks or combined hopper and topside tanks the requirements of Pt 4, Ch 1, 6.1 General and Pt 4, Ch 1, 6.1 General are to be complied with regarding arrangements to reduce stress concentrations. Alternatively, it is recommended that bulb plate or symmetrical sections are adopted.

6.3 Transverse stiffening

6.3.1 The scantlings of main and 'tween deck frames, and bottom frames in way of bracket floors, in the midship region are to comply with the requirements given in Table 1.6.3 Shell framing (transverse).

6.3.2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.

6.3.3 End connections of transverse main and 'tween deck frames are to be in accordance with Pt 3, Ch 10, 3 Secondary member end connections.

6.4 Primary supporting structure

6.4.1 Side transverses supporting longitudinal stiffening, and webs and stringers supporting transverse side stiffening, are to comply with the requirements of Table 1.6.4 Primary structure.

6.4.2 Side transverses are to be spaced not more than 3,8 m apart when the length, L , is less than 100 m and $(0,006L + 3,2)$ m apart where L is greater than 100 m.

Table 1.6.1: (a) Shell framing (longitudinal)

Location	Modulus, in cm ³
(1) Side longitudinals in way of dry spaces, including double skin construction, see Note 2	<p>The lesser of the following:</p> <p>(a) $Z = 0,056skh_{T1}l_e^2F_1F_S$</p> <p>(b) Z from (3)(a) evaluated using s, k and l_e for the longitudinal under consideration and the remaining parameters evaluated at the base line</p>
(2) Side longitudinals in way of double skin tanks or deep tanks, see Note 2	<p>The greater of the following:</p> <p>(a) Z as from (1)</p> <p>(b) As required by Ch1, 9 for deep tanks</p>
(3) Bottom and bilge longitudinals, see Notes 1, 2, 3 and 4	<p>The greater of the following:</p> <p>$Z = yskh_{T2}l_e^2F_1$</p> <p>$Z = yskh_{T3}l_e^2F_1F_{sb}$</p>
Symbols	
<p>L, D, T, s, k, k_L, ρ, as defined in Pt 4, Ch 1, 1.5 Symbols and definitions</p> <p>l_e = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions, but is not to be taken less than 1,5 m except in way of the centre girder brackets required by Pt 4, Ch 1, 8.5 Floors where a minimum span of 1,25 m may be used</p> <p>$l_{e1} = l_e$ in metres, but is not to be taken less than 2,5 m and need not be taken greater than 5,0 m</p> <p>$c_1 = \frac{60}{225 - 165F}$ at deck</p> <p>= 1,0 at $\frac{D_2}{2}$</p> <p>= $\frac{75}{225 - 150F_B}$ at baseline</p> <p>C_1 intermediate values by interpolation</p> <p>$D_1 = D_2$, in metres, but is not to be taken less than 10 and need not be taken greater than 16</p> <p>$D_2 = D$, in metres, but need not be taken greater than 1,6T</p> <p>F_B, F_D as defined in Pt 3, Ch 4, 5.7 Local reduction factors</p> <p>$F_1 = \frac{D_2 c_1}{4D_2 + 20\lambda_5}$ for side longitudinals above $\frac{D_2}{2}$</p> <p>= $\frac{D_2 c_1}{25D_2 + 20\lambda_5}$</p> <p>Minimum $F_1 = 0,14$</p> <p>for side longitudinals below $\frac{D_2}{2}$ and bottom longitudinals</p>	

$L_1 = L$ but need not be taken greater than 190 m

F_s is a fatigue factor for side longitudinals to be taken as follows:

(a) For built sections and rolled angle bars

$$F_s = \frac{1,1}{k} \left[1 - \frac{2b_f 1}{b_f} \left(1 - k \right) \right] \text{ at } 0,6D_2 \text{ above the base line}$$

= 1,0 at D_2 and above, and F_{sb} at the base line intermediate values by linear interpolation

(b) For flat bars and bulb plates $\frac{b_f 1}{b_f}$ may be taken as 0,5

F_{sb} is a fatigue factor for bottom longitudinals = 0,5 (1 + F_s at 0,6 D_2)

Where

b_{f1} = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, see Pt 4, Ch 9, 5.2 Symbols in Chapter 9

$h_{T1} = C_w \left(1 - \frac{\lambda_6}{D_2 - T} \right) F_\lambda$ in metres, for longitudinals above the waterline, at draught T , where $\left(1 - \frac{\lambda_6}{D_2 - T} \right)$ is not to be taken less than 0,7

= $\left[\lambda_6 + C_w \left(1 - \frac{\lambda_6}{2T} \right) \right] F_\lambda$ in metres, for longitudinals below the waterline at draught T

General Cargo Ships

Part 4, Chapter 1

Section 6

h_{T1} and h_{T2} need not exceed $0,86\left(\lambda_5 + \frac{D_1}{8}\right)$ for $F_1 \leq 0,14$ and $\left(\lambda_5 + \frac{D_1}{8}\right)$ for $F_1 > 0,14$

$h_{T2} = (T + 0,5C_W) F_\lambda$, in metres for bottom longitudinals

$h_{T3} = h_4 - 0,25T$, in metres

h_4 = load head required by Pt 4, Ch 1, 9.1 General for deep tanks

h_5 = vertical distance, in metres, from longitudinal to deck at depth, D_2

h_6 = vertical distance, in metres, from the waterline at draught T to the longitudinal under consideration

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, see Pt 4, Ch 9, 5.2 Symbols in Chapter 9

C_W = a wave head, in metres = $7,71 \times 10^{-2} L e^{-0,0044L}$ where e = base of natural logarithms 2,7183

$F_\lambda = 1,0$ for $L \leq 200$ m

= $[1,0 + 0,0023(L - 200)]$ for $L > 200$ m

$\gamma = 0,002/e_1 + 0,046$

NOTES

Note 1. The buckling requirements of Pt 3, Ch 4,7 are to be complied with. The ratio of the web depth, d_w , to web thickness, t , is to comply with the following requirements:

(a) Built up profiles and rolled angles:

$$\frac{d_w}{t} \leq 60\sqrt{K_L}$$

b) Flat bars:

$$\frac{d_w}{t} \leq 18\sqrt{K_L} \text{ when continuous at bulkheads}$$

$$\frac{d_w}{t} \leq 15\sqrt{K_L} \text{ when non-continuous at bulkheads}$$

Note 2. Where struts are fitted midway between transverses in way of double bottom tanks, or double skin construction, the modulus of the bottom or side longitudinals may be reduced by 50k per cent from that obtained from the locations (1), (2), or (3) as applicable.

Note 3. Where the bilge radius exceeds the Rule height of a double bottom the modulus of the longitudinal above this nominal height is to be derived from the location (1) or (2) as applicable.

Note 4. Where no bilge longitudinals are fitted and bilge brackets are required by location (3) in Table 1.5.2, at least two brackets are to be fitted.

Table 1.6.2: (b) Shell framing (longitudinal)

Location	Modulus, in cm ³
(1) Side longitudinals in way of dry spaces, including double skin construction, see Note 2	<p>The lesser of the following:</p> <p>(a) $Z = 0,056skh_{T1}l_e^2F_1F_S$</p> <p>(b) Z from (3)(a) evaluated using s and l_e for the longitudinal under consideration and the remaining parameters evaluated at the base line</p>
(2) Side longitudinals in way of double skin tanks or deep tanks, see Note 2	<p>The greater of the following:</p> <p>(a) Z as from (1)</p> <p>As required by Pt 4, Ch 1, 9.1 General for deep tanks using h_{T3} instead of h_4, but need not exceed Z from (3)(b) evaluated using γ, s and f_{ig} for the longitudinal under consideration and the remaining parameters evaluated at the base line</p>

h_4 = load head required by Pt 4, Ch 1, 9.1 General for deep tanks

h_5 = vertical distance, in metres, from longitudinal to deck at depth, D_2

h_6 = vertical distance, in metres, from the waterline at draught T to the longitudinal under consideration

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, see Pt 4, Ch 9, 5.2 Symbols in Chapter 9

C_w = a wave head, in metres = $7,71 \times 10^{-2} L e^{-0,0044L}$ where e = base of natural logarithms 2,7183

$F_\lambda = 1,0$ for $L \leq 200$ m

$= [1,0 + 0,0023(L - 200)]$ for $L > 200$ m

$\gamma = 0,002L_{e1} + 0,046$

NOTES

Note 1. The buckling requirements of Pt 3, Ch 4,7 are to be complied with. The ratio of the web depth, d_w , to web thickness, t , is to comply with the following requirements:

(a) Built up profiles and rolled angles:

$$\frac{d_w}{t} \leq 60\sqrt{K_L}$$

b) Flat bars:

$$\frac{d_w}{t} \leq 18\sqrt{K_L} \text{ when continuous at bulkheads}$$

$$\frac{d_w}{t} \leq 15\sqrt{K_L} \text{ when non-continuous at bulkheads}$$

Note 2. Where struts are fitted midway between transverses in way of double bottom tanks, or double skin construction, the modulus of the bottom or side longitudinals may be reduced by 50k per cent from that obtained from the locations (1), (2), or (3) as applicable.

Note 3. Where the bilge radius exceeds the Rule height of a double bottom the modulus of the longitudinal above this nominal height is to be derived from the location (1) or (2) as applicable.

Note 4. Where no bilge longitudinals are fitted and bilge brackets are required by location (3) in Table 1.5.2, at least two brackets are to be fitted.

Table 1.6.3: Shell framing (transverse)

(1) Main, 'tween deck and superstructure frames in dry spaces, see Note 3	The greater of the following: (a) $Z = C s k h_{T1} H^2 \times 10^{-3}$ (b) $Z = 9,1 s k D_1 \times 10^{-3}$	$I = \frac{3,2}{k} H Z$
(2) Main and 'tween deck frames in way of fuel or water ballast tanks or cargo holds used for water ballast	The greater of the following: (a) 1,15 x Z from (1) (b) $Z = 6,7 s k h H_2^2 \times 10^{-3}$	$I = \frac{3,2}{k} H Z$
(3) Frames supporting hatch end beams or deck transverses, see Note 2	The greater of the following: (a) Z from (1) (b) $Z = 2,5 (0,2 l_s^2 + H_1^2) k S_1 H_g$	$I = \frac{3,2}{k} H Z$
(4) Bottom frames of double bottom bracket floors	$Z = 2,15 s k T l_e \times 10^{-2}$	—
Symbols		
<p>D, T, s, k as defined in Pt 4, Ch 1, 1.5 Symbols and definitions</p> <p>C = end connection factor</p> <p>= 3,4 where two Rule standard brackets are fitted</p> <p>= 3,4 (1,8 - 0,8 (l_a / l)) where one Rule standard bracket and one reduced bracket fitted</p> <p>= 3,4 (2,15 - 1,15 (l_{amean} / l)) where two reduced brackets are fitted</p> <p>= 6,1 where one Rule standard bracket is fitted</p> <p>= 6,1 (1,2 - 0,2 (l_a / l)) where one reduced bracket is fitted</p> <p>= 7,3 where no bracket is fitted</p> <p>The requirements for frames where brackets larger than Rule standard are fitted will be specially considered</p> <p>l_a = equivalent arm length, in mm, as derived from Pt 3, Ch 10, 3.4 Scantlings of end brackets</p> <p>l_{amean} = mean equivalent arm length, in mm, for both brackets</p> <p>h_{T1} = head, in metres, at middle of H</p> <p>= $C_w \left(1 - \frac{h_6}{D_1 - T} \right) F_\lambda$, in metres for frames where the mid-length of frame is above the waterline, at draught T</p> <p>where $\left(1 - \frac{h_6}{D_1 - T} \right)$ is not to be taken less than 0,7</p> <p>= $[h_6 + C_w \left(1 - \frac{h_6}{2T} \right)] F_\lambda$, in metres for frames where the mid-length of frame is below the waterline at draught T</p> <p>h = h_4 or h_5, whichever is the greater</p> <p>h₄ = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>h₅ = head, in metres, measured from the mid-length of H, to the deck at side</p>		

h_6 = vertical distance in metres, from waterline at draught T to the mid-length of H

l_s = distance, in metres, from side shell to inboard support of beam or transverse

l_e = effective length, in metres, of bottom frames for double bottom bracket floors

l_h = length, in metres, of hatch side girder

C_w = a wave head, in metres,
 $= 7,71 \times 10^{-2} L e^{-0.0044L}$
 = where e = base of natural logarithm 2,7183

F_L = 1,0 for $L \leq 200$ m
 $= (1,0 + 0,0023 (L - 200))$ for $L > 200$ m

D_1 = D , but need not be taken greater than $1,6T$

H = H_{MF} or H_{TF} as applicable, see Note 1

H_{MF} = vertical framing depth, in metres, of main frames, as shown in Figure 1.6.1 Framing depths for various structural configurations, but is to be taken not less than 3,5 m

H_{TF} = vertical framing depth, in metres, of 'tween deck frames, as shown in Figure 1.6.1 Framing depths for various structural configurations, but is to be taken not less than 2,5 m

H_1 = H , but need not be taken greater than 3,5 m

H_2 = H , where H_{MF} is to be taken not less than 2,5 m

H_9 = weather head, h_1 , or cargo head, h_2 , in metres, as defined in Pt 3, Ch 3, 5 Design loading, whichever is applicable

S = spacing, in metres, of deck transverses

S_1 = $\frac{l_h}{4}$ for hatch end beams
 = S for transverses

Note 1. Where frames are inclined at more than 15° to the vertical, H_{MF} or H_{TF} is to be measured along a chord between span points of the frame.

Note 2. If the modulus obtained from (3) for frames under deck transverses exceeds that obtained from (1) and (2), the intermediate frames may be reduced provided that the combined modulus is maintained and the reduction in any intermediate frame is not greater than 35 per cent. The reduced modulus is to be not less than that given by (1)(b).

Note 3. The scantlings of main frames are not to be less than those of the 'tween deck frames above.

<p>T, S, l_e, k, ρ = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions</p> <p>h_4 = tank head, in metres, as defined in Pt 3, Ch 3, 5 Design loading</p> <p>h_{T1} = head, in metres, at mid-length of span</p> <p>= $C_w \left(1 - \frac{h_6}{D_1 - T} \right) F_{\lambda}$, in metres where mid-length of span is above the waterline at draught T, where $\left(1 - \frac{h_6}{D_1 - T} \right)$ is not to be taken less than 0,7</p> <p>= $\left[h_6 + C_w \left(1 - \frac{h_6}{2T} \right) \right] F_{\lambda}$, in metres where mid-length of span is below the waterline at draught T</p> <p>where</p> <p>h_6 = vertical distance, in metres, from the waterline at draught T, to the mid-length of span</p> <p>F_{λ} = 1,0 for $L \leq 200$ m = $[1,0 + 0,0023 (L - 200)]$ for $L > 200$ m</p> <p>C_w = a wave head, in metres = $7,71 \times 10^{-2} L_e^{-0,0044L}$ where e = base of natural logarithms 2,7183</p> <p>D_1 = D but need not be taken greater than 1,6T</p>		

Section 7

Single bottom structure

7.1 General

7.1.1 Requirements are given in this Section for single bottom construction in association with transverse framing, and are generally applicable to the following ships:

General Cargo Ships

Part 4, Chapter 1

Section 7

- (a) Cargo ships of less than 500 tons gross tonnage,
- (b) Ships not propelled by mechanical means, and
- (c) Trawlers and fishing vessels.

Cases where a single bottom structure is adopted in association with longitudinal framing will be considered.

7.1.2 Ships with single bottoms are to have a centre girder fitted. In addition, one side girder is to be fitted on each side of the centreline where B does not exceed 10 m, and two side girders on each side where B is greater than 10 m and does not exceed 17 m. In addition, continuous or intercostal longitudinal stiffeners are to be fitted where the panel size exceeds the ratio 4 to 1. Centre and side girders are to extend as far forward and aft as practicable, and where they cut at bulkheads the longitudinal strength is to be maintained.

7.1.3 Plate floors are to be fitted at every frame, and the tops of floors, in general, may be level from side to side, but in ships having considerable rise of floor, and towards the ends, the depth of the floor plates is to be increased. Floor plates forming part of a watertight or deep tank bulkhead are to be not less than 900 mm in depth measured at the centreline, and the thickness is to be not less than that required for the bottom strake of a bulkhead.

7.1.4 For ships intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

Table 1.7.1: Single bottom girders and floors

Item	Depth, in mm	Thickness, in mm	Face plate area, in cm ²
(1) Centre girder	As for floors	$t = \sqrt{Lk} + 2$ but not less than 6,0	$A_f = 0,67Lk$ but not less than 12,5 See Notes 2 and 3
(2) Side girders	As for floors	$t = \sqrt{Lk}$ but not less than 6,0	$A_f = (0,25L + 5)k$ but not less than 10,0 See Note 3
(3) Floors	Where $B \leq 10$ m $d_f = 40 (B + T)$ Where $B > 10$ m $d_f = 40 (1,5B + T) - 200$ (see Note 1)	$t = \frac{s\sqrt{k}}{s_1} \left(\frac{d_f}{100} + 3 \right)$ but not less than 6,0	$A_f = \frac{5Tsk}{s_1} \left(1 - \frac{2,5}{B} \right)$ See Notes 2 and 3
Symbols			
L, B, T, s, k = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions b_f = breadth of face plate, in mm d_f = overall depth of floor at the centreline, in mm s_1 = a standard frame spacing, in mm, and is to be taken as $2 (L + 240)$ A_f = cross-sectional area of face plate, in cm ²			
<p>Note 1. If the side frames are attached to the floors by brackets, the Rule depth of floor may be reduced by 15 per cent and the floor thickness determined using the reduced depth. The brackets are to be flanged and have the same thickness as the floors, and their arm lengths clear of the frame and are to be the same as the reduced floor depth given above.</p> <p>Note 2. The face plate thickness of floors and centre girder is to be not less than the floor plate thickness.</p> <p>Note 3. The thickness of face plates is to be: not less than $\frac{b_f}{16\sqrt{k}}$ nor more than $\frac{b_f}{8}$</p>			

7.1.5 Provision is made for the free passage of water from all parts of the bottom to the suction, taking into account the pumping rates required.

7.2 Girders and floors

7.2.1 The scantlings of girders and floors are to comply with the requirements of Table 1.7.1 Single bottom girders and floors.

■ *Section 8*

Double bottom structure

8.1 Symbols and definitions

8.1.1 The symbols used in this Section are defined as follows:

L, B, T = as defined in Pt 4, Ch 1, 1.5 Symbols and definitions

d_{DB} = Rule depth of centre girder, in mm

d_{DBA} = actual depth of centre girder, in mm

h_{DB} = head from top of inner bottom to top of over-flow pipe, in metres

s = spacing of stiffeners, in mm

H_{DB} = height from tank top, at position under consideration, to deck at side amidships, in metres

Z_{BF} = section modulus of bottom frame at bracket floor, in cm³.

8.2 General

8.2.1 Except as specified in Pt 4, Ch 1, 8.2 General, cargo ships other than tankers are to be fitted with a double bottom extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

8.2.2 Where a double bottom is required to be fitted, its depth at the centreline, d_{DB} , is to be in accordance with Pt 4, Ch 1, 8.3 Girders and the inner bottom is to be continued out to the ship's side in such a manner as to protect the bottom to the turn of the bilge.

8.2.3 Small wells constructed in the double bottom, in connection with the drainage arrangements of holds, are not to extend in depth more than necessary. A well extending to the outer bottom may, however, be permitted at the after end of the shaft tunnel of the ship. Other well arrangements (e.g. for lubricating oil under main engines) may be considered provided they give protection equivalent to that afforded by the double bottom. In no case shall the vertical distance from the bottom of such a well to a plane coinciding with the keel line be less than 500 mm for passenger ships and cargo ships other than tankers. Keel line is defined in SOLAS Chapter II-1, Part A, Regulation 2.

8.2.4 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not thereby impaired. In addition, a double bottom need not be fitted on the following ships:

- (a) Cargo ships of less than 500 tons gross tonnage.
- (b) Ships not propelled by mechanical means.
- (c) Trawlers and fishing vessels.

8.2.5 This Section provides for longitudinal or transverse framing in the double bottom, but for ships exceeding 120 m in length and for ships strengthened for heavy cargoes, longitudinal framing is, in general, to be adopted. For the additional requirements for ships specially strengthened for heavy cargoes, see Pt 4, Ch 7, 1.3 General class notations.

8.2.6 For ships intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

8.2.7 Girders and the side walls of duct keels are to be continuous, and the structure in way is to be sufficient to withstand the forces imposed by dry-docking the ship.

8.2.8 Adequate access is to be provided to all parts of the double bottom. The edges of all holes are to be smooth. The size of opening should not, in general, exceed 50 per cent of the double bottom depth, unless edge reinforcement is provided. In way of ends of floors and fore and aft girders at transverse bulkheads, the number and size of holes are to be kept to a minimum, and the openings are to be circular or elliptical. Edge stiffening may be required in these positions.

8.2.9 Provision is to be made for the free passage of air and water from all parts of the tank to the air pipes and suction, account being taken of the pumping rates required. To ensure this, sufficient air holes and drain holes are to be provided in all longitudinal and transverse non-watertight primary and secondary members. The drain holes are to be located as close to the bottom as is practicable, and air holes are to be located as close to the inner bottom as is practicable, see also Pt 3, Ch 10, 5.3 Openings and Pt 4, Ch 9, 5.8 Openings in longitudinals.

8.3 Girders

8.3.1 The minimum depth of the centre girder is to be taken as the greater of the following:

- (a) $d_{DB} = 28B + 205\sqrt{T}$ mm
- (b) $d_{DB} = 50B$ mm, but need not be taken as greater than 2000 mm
- (c) $d_{DB} = 760$ mm.

8.3.2 The centre girder thickness is to be not less than:

$$t = (0,008d_{DB} + 4)\sqrt{k} \text{ mm}$$

nor less than 6,0 mm. The thickness may be determined using the value for d_{DB} without applying the minimum depths specified in Pt 4, Ch 1, 8.3 Girders and Pt 4, Ch 1, 8.3 Girders.

8.3.3 **In transversely framed ships** where the breadth, B , does not exceed 10 m, no side girders are required, and one vertical stiffener is to be fitted to the floors on each side, about midway between the centreline and the margin plate. One side girder is to be fitted where the breadth, B , exceeds 10 m but does not exceed 20 m, and for greater breadths two girders are to be fitted on each side of the centreline. The non-watertight side girders are to extend as far forward and aft as practicable and are to have a thickness not less than:

$$t = (0,008d_{DB} + 1)\sqrt{k} \text{ mm}$$

nor less than 6,0 mm.

8.3.4 Vertical stiffeners are to be fitted at every bracket floor (see Pt 4, Ch 1, 8.5 Floors), and are to have a depth not less than the depth of the tank top frame or 150 mm, whichever is the greater. For ships with a length, L , less than 90 m, stiffeners are to have a depth of not less than $1,65L$ mm with a minimum of 50 mm. The thickness is to be as required for the girder. Watertight side girders are to have a thickness 1 mm greater than required by Pt 4, Ch 1, 8.3 Girders for non-watertight side girders. Where the double bottom tanks are interconnected with side tanks or cofferdams, the thickness is to be as for deep tanks (see Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads) with h , in metres, measured to the highest point at the side tank or cofferdam.

8.3.5 **In longitudinally framed ships** one side girder is to be fitted where the breadth, B , exceeds 14 m, and two girders are to be fitted on each side of the centreline where B exceeds 21 m. The girders are to extend as far forward and aft as practicable and are to have a thickness not less than:

$$t = (0,0075d_{DB} + 1)\sqrt{k} \text{ mm}$$

nor less than 6,0 mm.

In general, a vertical stiffener, having a depth not less than 100 mm and a thickness equal to the girder thickness, is to be arranged midway between floors.

8.3.6 **Watertight side girders** are to have a plating thickness corresponding to the greater of the following:

- (a) $t = (0,0075d_{DB} + 2)\sqrt{k}$ mm, or
- (b) thickness t as for deep tanks (see Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads) with h , in metres, measured to the highest point of the side tank, or cofferdam if the double bottom is interconnected with these tanks.

8.3.7 Watertight side girder stiffeners are to be in accordance with the requirements for watertight floors, see Pt 4, Ch 1, 8.5 Floors and Pt 4, Ch 1, 8.5 Floors.

8.3.8 **Duct keels**, where arranged, are to have a thickness of side plates corresponding to the greater of the following:

(a) $t = (0,008d_{DB} + 2)\sqrt{k}$ mm, or

(b) thickness t , as for deep tanks, (see Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads) with h , in metres, measured to the highest point of the side tank, or cofferdam if the double bottom tank is interconnected with these tanks.

8.3.9 The sides of duct keels are, in general, to be spaced not more than 2,0 m apart. Where the sides of the duct keels are arranged on either side of a centreline or side girder, each side is, in general, to be spaced not more than 2,0 m from the centreline or side girder. The inner bottom and bottom shell within the duct keel are to be suitably stiffened. The primary stiffening in the transverse direction is to be suitably aligned with the floors in the adjacent double bottom tanks. Where the duct keels are adjacent to double bottom tanks which are interconnected with side tanks or cofferdams, the stiffening is to be in accordance with the requirements for deep tanks, see Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads. Access to the duct keel is to be by watertight manholes or trunks.

8.3.10 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

8.4 Inner bottom plating and stiffening

8.4.1 The thickness of the inner bottom plating in the holds is to be not less than:

$$t = 0,00136(s + 660)\sqrt[4]{k^2LT} \text{ mm}$$

nor less than 6,5 mm in holds and 7,5 mm under hatchways if no ceiling is fitted.

8.4.2 The thickness of the inner bottom plating as determined in Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening is to be increased by 2 mm under the hatchways if no ceiling is fitted. If cargo is to be regularly discharged by grabs, see Pt 4, Ch 1, 2.2 Protection of steelwork.

8.4.3 A margin plate, if fitted, is to have a thickness throughout 20 per cent greater than that required for inner bottom plating.

8.4.4 Where the double bottom tanks are common with side tanks or cofferdams, the thickness of the inner bottom plating is to be not less than that required for deep tanks (see Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads), with h , in metres, taken to the highest point of the side tank or cofferdam, and K_1 is to be taken as 'elsewhere'.

8.4.5 Inner bottom longitudinals, or tank top frames at bracket floors within the range of cargo holds, are to have a section modulus not less than 85 per cent of the Rule value for bottom longitudinals (see Pt 4, Ch 1, 6.2 Longitudinal stiffening) or bottom frames in way of bracket floors (see Pt 4, Ch 1, 6.3 Transverse stiffening), whichever is applicable. The unsupported span of tank top frames is generally not to exceed 2,5 m. Where the double bottom tanks are interconnected with side tanks, hopper and topside tanks or cofferdams, the scantlings are to be not less than those required for deep tanks, see Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads. For higher tensile steel inner bottom longitudinals the requirements of Pt 4, Ch 1, 6.2 Longitudinal stiffening are to be complied with where applicable.

8.4.6 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

8.5 Floors

8.5.1 **In longitudinally framed ships**, plate floors are to be fitted under bulkheads and elsewhere at a spacing not exceeding 3,8 m. The thickness of non-watertight plate floors is to be not less than:

$$t = (0,009d_{DB} + 1)\sqrt{k} \text{ mm}$$

nor less than 6,0 mm. The thickness need not be greater than 15 mm, but the ratio between the depth of the double bottom and the thickness of the floor is not to exceed $130\sqrt{k}$. This ratio may, however, be exceeded if suitable additional stiffening is fitted. Vertical stiffeners are to be fitted at each longitudinal, having a depth not less than 150 mm and a thickness equal to the thickness of the floors. For ships of length, L , less than 90 m, the depth is to be not less than $1,65L$ mm, with a minimum of 50 mm.

8.5.2 The thickness of watertight floors for longitudinally framed ships is to be not less than:

(a) $t = (0,008d_{DB} + 3)\sqrt{k}$ mm, or

(b) $t = (0,009d_{DB} + 1)\sqrt{k}$ mm

(c) whichever is the greater,

but need not exceed 15 mm on floors of normal depth. The thickness is also to satisfy the requirements for deep tanks (see Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads) with h , in metres, taken to the highest point of the side tank, or cofferdam if the double bottom tank is interconnected with these tanks. The scantlings of stiffeners are to be in accordance with the requirements

of Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads for deep tanks, or as required by Pt 4, Ch 1, 8.5 Floors whichever is the greater. The stiffeners are to be connected to the inner bottom and shell longitudinals.

8.5.3 Between plate floors, transverse brackets having a thickness not less than $0,009d_{DB}$ mm are to be fitted, extending from the centre girder and margin plate to the adjacent longitudinal. The brackets, which are to be suitably stiffened at the edge, are to be fitted at every frame at the margin plate, and those at the centre girder are to be spaced not more than 1,25 m.

8.5.4 **In transversely framed ships**, plate floors are to be fitted under bulkheads, in way of change in depth of double bottom and elsewhere at a spacing not exceeding 3,0 m. The shell inner bottom plating between these floors is to be supported by bracket floors. The thickness of non-watertight plate floors is to be not less than:

$$t = (0,008d_{DB} + 1)\sqrt{k} \text{ mm}$$

but need not exceed 15 mm and is to be not less than 6 mm. Watertight or strengthened floors are to be fitted below, or in the vicinity of, watertight bulkheads, and their thickness is to be 2 mm greater than that derived above for non-watertight floors, but need not exceed 15 mm on floors of normal depth. If the depth of such floors exceeds 915 mm but does not exceed 2000 mm, the floors are to be fitted with vertical stiffeners spaced not more than 915 mm apart and having a section modulus not less than:

$$Z = 5,41 d_{DBA}^2 h_{DB} sk \times 10^{-9} \text{ cm}^3$$

The ends of the stiffeners are to be sniped.

8.5.5 Where the double bottom tanks are interconnected with side tanks or cofferdams, or where the depth of floor exceeds 2000 mm, the scantlings of watertight floors are to be not less than those required for deep tanks (see Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads), and the ends of the stiffeners are to be bracketed top and bottom.

8.5.6 Where floors form the boundary of a sea inlet box, the thickness of the plating is to be the same as the adjacent shell, but not less than 12,5 mm and need not exceed 25 mm. The scantlings of stiffeners, where required are, in general, to comply with Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads for deep tanks. Sniped ends for stiffeners on the boundaries of these spaces are to be avoided wherever practicable. The stiffeners should be bracketed or the free end suitably supported to provide alignment with backing structure.

8.5.7 **Where bracket floors** are fitted, the bottom frames are to be derived from Pt 4, Ch 1, 6.3 Transverse stiffening. The unsupported span of the frames is not to exceed 2,5 m. The breadth of the brackets attaching the frames and the reverse frames to the centre girder and margin plate is to be three-quarters of the depth of the centre girder. The brackets are to be flanged on the unsupported edge and are to have the same thickness as the plate floors.

8.5.8 **Where struts** are fitted to reduce the unsupported span of the frames, reverse frames and longitudinals, they are to have a cross-sectional area of not less than:

$$(a) \quad A = 0,32Z_{BF} \text{ cm}^2 \quad \text{for } Z_{BF} \leq 83,5, \text{ or}$$

$$(b) \quad A = 23,2 + \frac{Z_{BF}}{25} \text{ cm}^2 \quad \text{for } Z_{BF} > 83,5$$

where Z_{BF} is the modulus, in cm^3 , of the frame or longitudinal based on the effective length between floors as defined in Pt 3, Ch 3, 3 Structural idealisation.

Section 9 Bulkheads

9.1 General

9.1.1 The requirements of this Section cover watertight and deep tank transverse and longitudinal bulkheads. Requirements are also given for shaft tunnel boundaries and non-watertight bulkheads. For transverse bulkheads in way of ballast holds, stools may be required, see Pt 4, Ch 7, 10.2 Bulkheads supported by stools.

9.1.2 The requirements of this Section apply to a vertical system of stiffening on bulkheads. They may also be applied to a horizontal system of stiffening provided that equivalent end support and alignment are provided.

9.1.3 For number and disposition of transverse watertight bulkheads, see Pt 3, Ch 3, 4 Bulkhead requirements.

9.1.4 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

9.2 Watertight and deep tank bulkheads

9.2.1 The scantlings of watertight and deep tank bulkheads are to comply with the requirements of Table 1.9.1 Watertight and deep tank bulkhead scantlings to Table 1.9.3 Bulkhead end constraint factors. Where bulkhead stiffeners support deck girders, transverses or pillars over, the requirements of Pt 4, Ch 1, 4.4 Deck supporting structure are also to be satisfied.

9.2.2 In way of partially filled holds or tanks, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of the liquid in those spaces. The magnitude of the predicted loadings, together with the scantling calculations may require to be submitted, see Pt 3, Ch 3, 5.4 Design pressure for partially filled tanks.

9.2.3 In deep tanks, fuel oil or oil carried as cargo is to have a flash point of 60°C or above (closed-cup test). Where tanks are intended for other liquid cargoes of a special nature the scantlings and arrangements will be considered in relation to the nature of the cargo.

9.2.4 Where watertight bulkhead stiffeners are cut in way of watertight doors in the lower part of a bulkhead, the opening is to be suitably framed and reinforced. Where stiffeners are not cut but the spacing between the stiffeners is increased on account of watertight doors, the stiffeners at the sides of the doorways are to be increased in depth and strength so that the efficiency is at least equal to that of the unpierced bulkhead, without taking the stiffness of the door frame into consideration. Watertight recesses in bulkheads are generally to be so framed and stiffened as to provide strength and stiffness equivalent to the requirements for watertight bulkheads.

9.2.5 A centreline bulkhead is, generally, to be fitted in deep tanks which extend from side to side of the ship and are intended for the carriage of fuel oil for the ship's use. The bulkhead may be intact or perforated as desired. If intact, the scantlings are to be as required for boundary bulkheads. If perforated, the modulus of the stiffeners may be 50 per cent of that required for boundary bulkheads, using h_4 measured to the crown of the tank. The stiffeners are to be bracketed at top and bottom. The area of perforation is to be not less than five per cent nor more than 10 per cent of the total area of the bulkhead. Where brackets from horizontal girders on the boundary bulkheads terminate at the centreline bulkhead, adequate support and continuity are to be maintained.

9.3 Shaft tunnels

9.3.1 Where shaft tunnels are required as specified in Pt 3, Ch 3, 4 Bulkhead requirements the thickness of the tunnel plating is to comply with Table 1.9.1 Watertight and deep tank bulkhead scantlings for holds or deep tanks as appropriate. If the top plating is well curved, the thickness may be reduced by 10 per cent in dry cargo holds. If the top plating is flat, it is to be not less than 1,1 times the thickness required for watertight bulkheads in dry cargo holds. Under hatchways the top plating is to be increased by 2 mm, unless covered with wood not less than the thickness specified in Pt 4, Ch 1, 2.2 Protection of steelwork, which is to be secured by fastenings which do not penetrate the plating. Where it is intended to use plywood or other forms of ceiling of an approved type instead of planking, the thickness will be considered in each case. The tunnel stiffeners are to comply with Table 1.9.1 Watertight and deep tank bulkhead scantlings for holds or deep tanks, as appropriate. When the section modulus of curved stiffeners is determined, the values of ω_1 and ω_2 are to be taken as 1,0. The span of the stiffener, l_e , is to be taken as the overall height of the tunnel, measured vertically at the centreline of the tunnel. If the tunnel top is flat, scantlings of the stiffeners are also to comply with Pt 4, Ch 1, 4.3 Deck stiffening. The lower end connection to the tank top is to be welded. Additional strengthening is to be fitted under the heels of pillars or masts stepped on the tunnel.

9.4 Non-watertight bulkheads

9.4.1 The scantlings are to be in accordance with Table 1.4.8 Non-watertight pillar bulkheads.

Table 1.9.1: Watertight and deep tank bulkhead scantlings

Item and requirement	Watertight bulkheads	Deep tank bulkheads
(1) Plating thickness for plane, symmetrically corrugated and double plate bulkheads	$t = 0,004sf\sqrt{h_4k}$ mm but not less than 5,5 mm	$t = 0,004sf\sqrt{\frac{\rho h_4k}{1,025}} + 2,5$ mm but not less than 6,5 mm, where $L < 90$ m not less than 7,5 mm, where $L \geq 90$ m
	In the case of symmetrical corrugations, s is to be taken as b or c in Figure 3.3.1 Corrugation dimensions in Pt 3, Ch 3, whichever is the greater	
(2) Modulus of rolled and built stiffeners, swedges, double plate bulkheads and symmetrical corrugations	$Z = \frac{skh_4l_e^2}{71\gamma(\omega_1 + \omega_2 + 2)} \text{ cm}^3$	$Z = \frac{\rho skh_4l_e^2}{22\gamma(\omega_1 + \omega_2 + 2)} \text{ cm}^3$
	In the case of symmetrical corrugations, s is to be taken as p , see also Note 2	
(3) Inertia of rolled and built stiffeners and swedges	—	$I = \frac{2,3}{k}l_e Z \text{ cm}^4$
(4) Symmetrical corrugations and double plate bulkheads	Additional requirements to be complied with as detailed in Table 1.9.2 Symmetrical corrugations and double plate bulkheads (additional requirements)	
(5) Stringers or webs supporting vertical or horizontal stiffening		
(a) Modulus	$Z = 5,5kh_4Sl_e^2 \text{ cm}^3$	$Z = 11,7\rho kh_4Sl_e^2 \text{ cm}^3$
(b) Inertia	—	$I = \frac{2,5}{k}l_e Z \text{ cm}^4$
Symbols		

s, S, l, k, ρ as defined in Pt 4, Ch 1, 1.5 Symbols and definitions

d_w = web depth of stiffening member, in mm

$f = 1, 1 - \frac{s}{2500S}$ but not to be taken greater than 1,0

h_4 = load head, in metres measured as follows:

- (a) For watertight bulkhead plating, the distance vertically from a point one-third of the height of the plate above its lower edge to a point 0,91 m above the bulkhead deck at side or perpendicular to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater, see *also* Figure 3.5.2 Heads for watertight and deep tank bulkheads in Pt 3, Ch 3
- (b) For deep tank bulkhead plating, the distance from a point one-third of the height of the plate above its lower edge to the top of the tank, or half the distance to the top of the overflow, whichever is the greater, see *also* Figure 3.5.2 Heads for watertight and deep tank bulkheads in Pt 3, Ch 3
- (c) For watertight bulkhead stiffeners or girders, the distance vertically from the middle of the effective length to a point 0,91 m above the bulkhead deck at sideside, or perpendicular to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater, see *also* Figure 3.5.2 Heads for watertight and deep tank bulkheads in Pt 3, Ch 3
- (d) For deep tank bulkhead stiffeners or girders, the distance from the middle of the effective length to the top of the tank, or half the distance to the top of the overflow, whichever is the greater, see *also* Figure 3.5.2 Heads for watertight and deep tank bulkheads

l_e = effective length of stiffening member, in metres, and for bulkhead stiffeners, to be taken as $l - e_1 - e_2$, see *also* Figure 1.9.1 End connections

ρ = spacing of corrugations as shown in Figure 3.3.1 Corrugation dimensions

γ = 1,4 for rolled or built sections and double plate bulkheads

= 1,6 for flat bars

= 1,1 for symmetrical corrugations of deep tank bulkheads

= 1,0 for symmetrical corrugations of watertight bulkheads

ω, θ = as defined in Table 1.9.3 Bulkhead end constraint factors, see *also* Figure 1.9.1 End connections

Note 1. In no case are the scantlings of deep tank bulkheads to be less than the requirements for watertight bulkheads where watertight bulkheads are required by Pt 3, Ch 3, 5 Design loading.

Note 2. In calculating the actual modulus of symmetrical corrugations the panel width b is not to be taken greater than that given by Pt 3, Ch 3, 3.2 Geometric properties of section

Note 3. For rolled or built stiffeners with flanges or face plates, the web thickness is to be not less than $\frac{d_w}{60\sqrt{k}}$ whilst for flat bar stiffeners the web thickness is to be not less than $\frac{d_w}{18\sqrt{k}}$

Symbols						

General Cargo Ships

Part 4, Chapter 1

Section 9

s, l, p, k , as defined in Pt 4, Ch 1, 1.5 Symbols and definitions

a = height, in metres, of bracket or end stool or lowest strake of plating of symmetrically corrugated or double plate bulkheads, see Figure 1.9.1 End connections

d_A = web depth, in mm, of adjacent member A

e = effective length, in metres, of bracket or end stool, see Figure 1.9.1 End connections

h_o = h_4 but measured from the middle of the overall length l

ω, p, h as defined in Table 1.9.1 Watertight and deep tank bulkhead scantlings

t_B = thickness, in mm, of flange plating of member B

t_f = thickness, in mm, of supporting floor

t_m, t_e = thickness, in mm, of flange plating of corrugation or double plate bulkhead at mid-span or end, respectively Subscripts 1 and 2 when applied to ω, e , and a refer to the top and bottom ends of stiffener

$$M_1 = \frac{h_4 s l^2}{71} e \text{ for watertight bulkheads}$$

$$= \frac{p h_4 s l^2}{22} e \text{ for deep tank bulkheads}$$

$$M_2 = \frac{h_o s l^2}{71} \text{ for watertight bulkheads}$$

$$= \frac{p h_o s l^2}{22} \text{ for deep tank bulkheads}$$

In the case of symmetrical corrugations $s = p$

Z_B = section modulus, in cm^3 , of adjacent member B

Z_s = section modulus, in cm^3 , of horizontal section of stool adjacent to deck or tank top over breadth s or p (as applicable)

All material which is continuous from top to bottom of stool may be included in the calculation

α = a factor depending on μ and determined as follows:

where $\mu \leq 1,0$ $\alpha = 0$

where $\mu > 1,0$ $\alpha = 0,5 - \frac{1}{\sqrt{2\mu + 2}}$

β = a factor depending on the end bracket stiffening and to be taken as:
1,0 for brackets with face bars directly connected to stiffener face bars
0,7 for flanged brackets
0,5 for unflanged brackets

μ = a factor representing end constraint for symmetrical corrugation and double plate bulkheads

ω = an end constraint factor relating to the different types of end connection, see Figure 1.9.1 End connections

t_s = thickness, in mm, of stool adjacent to bulkhead

δ = 1,0 generally

δ = $\frac{0,932\sqrt{k}}{\xi}$ for corrugated watertight bulkheads

ξ = 1,0 where full continuity of corrugation webs is provided at the ends

ξ = greater of 1,0 and $(\eta + 0,333)$ where full continuity is not provided

η = lesser of 1,0 and $\frac{50t_m\sqrt{k}}{b}$ for welded sections

η = lesser of 1,0 and $\frac{60t_m\sqrt{k}}{b}$ for cold formed sections

Note 1. Where the end connection is similar to type 2 or 3, but member flanges (or bulbs) are not aligned and brackets are not fitted, $\omega=0$.

Note 2. Where the end connection is similar to type 12 or 13, but a transverse girder is arranged in place of one of the supporting floors, special consideration will be required.

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to sea-going roll on-roll off cargo ships, passenger ships, sailing passenger ships and passenger yachts, defined as follows:

- (a) A passenger ferry is defined as a ship specially designed and constructed for the carriage of passengers on a regular scheduled service between specified ports operating in reasonable weather conditions.
- (b) A passenger/vehicle ferry is defined as a ship specially designed and constructed for the carriage of passengers and vehicles on a regular scheduled service between specified ports operating in reasonable weather conditions.
- (c) A roll on-roll off cargo ship is defined as a ship specially designed and constructed for the carriage of vehicles, and cargo in pallet form or in containers, and loaded/unloaded by wheeled vehicles.
- (d) A passenger ship is defined as a ship specially designed and constructed for the carriage of more than 12 passengers.
- (e) A sailing passenger ship is defined as a ship specially designed and constructed for the carriage of more than 12 passengers and incorporating sail devices which are intended to be the primary means of propulsion.
- (f) A passenger yacht is defined as a yacht that is specially designed and constructed in accordance with Administration requirements for passenger yachts with due regard to the applicability of the conventions as given in Pt 1, Ch 2, 1.1 General, as determined in accordance with the British Red Ensign Group *Code of Practice for Yachts Carrying 13 to 36 Passengers (Passenger Yacht Code)*, and subsequent revisions.

1.1.2 Ships intended to operate only in certain areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2 Classification Regulations, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval.

1.1.3 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships except as otherwise specified in this Chapter.

1.1.4 The scantlings of the primary supporting structure for multi-decked passenger ships are to be assessed by direct calculation, in accordance with the *ShipRight Structural Design Assessment Procedure* for passenger ships, wherever:

Ferries, Roll On-Roll Off Ships and Passenger Ships

Part 4, Chapter 2

Section 1

- (a) the superstructure will be subjected to significant load from flexure of the hull girder; or
- (b) it is required to utilise the load-carrying capability of the superstructure for longitudinal strength; or
- (c) a limited number of transverse bulkheads above the bulkhead deck are present to carry the racking response.

See also Pt 4, Ch 2, 1.3 Class notations and Pt 4, Ch 2, 1.3 Direct calculation.

1.1.5 The scantlings of the primary supporting structure of a vehicle ferry, passenger/vehicle ferry, roll on-roll off cargo ship, roll on-roll off passenger ship or vehicle carrier are to be assessed by direct calculation in accordance with the *ShipRight Structural Design Assessment Procedure* for Ro-Ro ships and the *ShipRight Construction Monitoring Procedure*. See also Pt 4, Ch 2, 1.3 Class notations and Pt 4, Ch 2, 1.3 Direct calculation.

1.1.6 For the purpose of providing operational information to the Master for safe return to port after a flooding casualty, passenger ships having a Load Line length of 120 m or more or having three or more main vertical zones are to have:

- (a) an onboard stability computer; or
- (b) shore-based support.

Where an onboard computer system having a stability computation capability is provided, the system is to be certified in accordance with LR's document entitled *Approval of Longitudinal Strength and Stability Calculations Programs*, see also Pt 1, Ch 2, 1.1 General.

1.2 Structural configuration

1.2.1 The requirements provide for a basic structural configuration of a multi-deck hull which includes a double bottom, and in some cases wing tanks up to the lowest deck.

1.2.2 For passenger ships, the structural arrangements detailed in Chapter II-1, Part B, of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments as they apply to passenger ships are to be complied with in their entirety.

1.2.3 Where bulkheads are omitted in accordance with Pt 3, Ch 3, 4 Bulkhead requirements, a system of partial bulkheads, web frames and deck transverses should be fitted to provide equivalent transverse strength.

1.2.4 Longitudinal framing is, in general, to be adopted at the strength deck and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.

1.2.5 Reference should be made to the Regulations of the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments and to the relevant Statutory Requirements of the National Authority of the country in which the ship is to be registered.

1.2.6 Attention is also drawn to the requirements for passenger ships given in:

- Bulkhead requirements, see Pt 3, Ch 3, 4 Bulkhead requirements
- Closing arrangements for shell, deck and bulkheads, see Pt 3, Ch 11, 6 Miscellaneous openings, Pt 3, Ch 11, 8 Side and stern doors and other shell openings and Pt 3, Ch 11, 9 Watertight doors in bulkheads below the freeboard deck
- Electrical installations, see Pt 6, Ch 2 Electrical Engineering
- Fire protection, detection and extinction, see SOLAS Reg. II-2 /B and C.

1.2.7 Attention is drawn to National Authority requirements relating to the stowage and securing of vehicles and cargo units on board roll on-roll off ships. Steel used for the construction of fixed securing fittings attached to the ship's structure is to comply with the requirements of *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials), or with an equivalent acceptable specification. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment and the chemical composition of the steel is to be such as to ensure acceptable qualities of weldability.

1.2.8 Sailing passenger ships are to be fitted with auxiliary propulsive power to ensure adequate speed and manoeuvrability of the vessel in conditions when the sail systems are not available for use. The auxiliary propulsion and other essential machinery are to comply with the requirements of Pt 5 Main and Auxiliary Machinery of the Rules, as applicable.

1.2.9 Sail systems may be made up in the form of soft sails, semi-rigid and rigid sail configurations including wind turbines or systems incorporating rotating cylinders.

1.2.10 For sailing vessels, a continuous visual read out of the apparent wind speed and direction is to be available to the ship's master when the vessel is under way. Sail control and service systems are to provide adequate speed of response to neutralise the sail system in the event of high wind conditions. Sufficient information and evidence is to be submitted to substantiate that the foregoing arrangements are in place.

Ferries, Roll On-Roll Off Ships and Passenger Ships

Part 4, Chapter 2

Section 1

1.2.11 For sailing passenger ships, the Rules for classification will, in principle, apply to the mast arrangements and standing gear, but will exclude running gear, yards, booms and sail arrangements.

1.2.12 For sailing passenger ships, the equipment requirements will be in accordance with the letter and numeral two grades higher than that corresponding to the calculated Equipment Numeral.

1.3 Class notations

1.3.1 In general, ships complying with the requirements of this Chapter will be eligible to be classed:

- '100A1 passenger ferry', or
- '100A1 passenger/vehicle ferry' or
- '100A1 roll on-roll off cargo ship', or
- '100A1 roll on-roll off passenger ship', or
- '100A1 vehicle carrier', or
- '100A1 passenger ship', or
- '100A1 passenger yacht', or
- '100A1 sailing passenger ship'.

1.3.2 For passenger ships that comply with the requirements of the European Council Directive 98/18/EC of 17 March 1998 on safety rules and standards for passenger ships, and subsequent revisions, the following class notations may be appended to the main class notation:

- (a) **EU(A)**. This class notation will be assigned to a passenger ship engaged on domestic voyages other than voyages covered by Classes B, C and D.
- (b) **EU(B)**. This class notation will be assigned to a passenger ship engaged on domestic voyages in the course of which it is at no time more than 20 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.
- (c) **EU(C)**. This class notation will be assigned to a passenger ship engaged on domestic voyages in sea areas where the probability of exceeding 2,5 m significant wave height is smaller than 10 per cent over a one-year period for all-year-round operation, or over a specific restricted period of the year for operation exclusively in such period (e.g. summer period operation), in the course of which it is at no time more than 15 miles from a place of refuge, nor more than 5 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.
- (d) **EU(D)**. This class notation will be assigned to a passenger ship engaged on domestic voyages in sea areas where the probability of exceeding 1,5 m significant wave height is smaller than 10 per cent over a one-year period for all-year-round operation, or over a specific restricted period of the year for operation exclusively in such period (e.g. summer period operation), in the course of which it is at no time more than 6 miles from a place of refuge, nor more than 3 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.

1.3.3 A ship assigned a class notation incorporating the word 'passenger', which is also designed to fulfil other functions not associated with passenger carrying is to comply with the requirements of this Chapter for passenger ships together with the requirements of the relevant Chapter of this Part for the particular ship type.

1.3.4 Where ferries are specially reinforced for the carriage of trains on fixed rails, the class notation will also include the word 'train'.

1.3.5 The Regulations for the classification and assignment of class notations are given in Pt 1, Ch 2 Classification Regulations, to which reference should be made.

1.3.6 The 'ShipRight Procedures' for hull construction of ships are detailed in Pt 3, Ch 16 ShipRight Procedures for the Design, Construction and Lifetime Care of Ships and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2, 2 Character of classification and class notations.

1.3.7 The 'Structural Design Assessment' (**SDA**) and 'Construction Monitoring' (**CM**) procedures detailed in the *ShipRight Procedures Manual*, published by Lloyd's Register (hereinafter referred to as 'LR'), are mandatory for passenger ships where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where it is required to utilise the load carrying capability of the superstructure for longitudinal strength, and for other passenger ships of abnormal hull form, or of unusual structural configuration or complexity.

Ferries, Roll On-Roll Off Ships and Passenger Ships

Part 4, Chapter 2

Section 2

1.4 Information required

1.4.1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, the following details are to be submitted:

- The intended service areas required for ships designed to operate within specified geographical limits.
- Stern or bow ramps.
- Bow, stern and side doors.
- Movable decks, if fitted, including stowing arrangements for portable components.
- Sail plans and associated operational and design conditions, including apparent wind speeds (sailing ships).
- Masts and all structural components of the standing rigging (sailing ships).
- The standing rigging and all standing rigging attachments (sailing ships).
- The design deck loadings including details of wheeled vehicles, see Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles, and trains, where applicable.
- Locations of fixed securing points for wheeled vehicles, with indication of the magnitude and direction of the imposed lashing force.

1.5 Symbols

1.5.1 For the definition of symbols not defined in this Chapter, see Pt 4, Ch 1, 1.5 Symbols and definitions.

1.5.2 The following definitions apply to ships employing sails:

Standing rigging	– Rigging of fixed length used to support masts/bowsprit.
Running rigging	– Rigging used to control yards, booms and sails and which may pass over revolving sheaves.
Apparent wind speed	– The vector resultant of the combination of real wind speed and ship velocity.

■ Section 2 Longitudinal strength

2.1 General

2.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 Longitudinal Strength and the additional notes contained in this Section.

2.1.2 The design vertical wave bending moments and design wave shear forces to be used in Pt 3, Ch 4 Longitudinal Strength are to be determined in accordance with Pt 4, Ch 2, 2.5 Design wave shear force and Pt 4, Ch 2, 2.4 Design vertical wave bending moments below. For ships of unusual hullform or where their design parameters are outwith the applicability of the Rules, see Pt 3, Ch 4 Longitudinal Strength, special consideration will be given to the values and distributions of the wave induced global loads.

2.1.3 The still water bending moment and shear force envelopes are to take into account the requirements of Pt 4, Ch 2, 2.3 Still water bending moments and shear forces.

2.1.4 For ships where the side shell or side casings contain large openings or where the effectiveness of the superstructures in resisting hull girder bending loads is expected to be reduced by the presence of large numbers of windows or openings, the combined hull and superstructure response may require to be verified using direct calculation techniques.

2.2 Calculation of hull section modulus

2.2.1 The calculation of section modulus is to be in accordance with Pt 3, Ch 3, 3.4 Calculation of hull section modulus and the additional notes in this Section. In general, the effective sectional area of continuous longitudinal strength members, after

deduction of openings, is to be used for the calculation of midship section modulus. For ships where the effectiveness of the superstructure is only partial due to the presence of large or numerous shell openings or discontinuities in the shell envelope, an equivalent section modulus for the purposes of this Section may be derived using direct calculations in accordance with the SDA procedure relevant to the ship type.

2.2.2 Structural members which contribute to the overall hull girder strength are to be carefully aligned so as to avoid discontinuities resulting in abrupt variations of stresses and are to be kept clear of any form of openings which may affect their structural performances.

2.2.3 In general, short superstructures, see also Pt 3, Ch 3, 3.4 Calculation of hull section modulus, or deckhouses will not be accepted as contributing to the global longitudinal or transverse strength of the ship. However, where it is proposed to include substantial continuous stiffening members, special consideration will be given to their inclusion on submission of the designer's/Builder's calculations, see also Pt 4, Ch 2, 2.6 Buckling strength.

2.2.4 Adequate transition arrangements are to be fitted at the ends of effective continuous longitudinal strength members in the deck and bottom structures.

2.2.5 Scantlings of all continuous longitudinal members of the hull girder based on the minimum section stiffness requirements determined from Pt 4, Ch 4, 5 Superstructures and deckhouses are to be maintained within $0,4L$ amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the $0,4L$ part, bearing in mind the desire not to inhibit the ship's loading and operational flexibility.

2.2.6 Structural material which is longitudinally continuous but which is not considered to be fully effective for longitudinal strength purposes may be specially considered. The global longitudinal strength assessment must take into account the presence of such material when it can be considered effective. The consequences of failure of such structural material and subsequent redistribution of stresses into or additional loads imposed on the remaining structure is to be considered.

2.2.7 In particular, all longitudinally continuous material will be fully effective in tension whereas this may not be so in compression due to a low buckling capability. In this case, it may be necessary to derive and apply different hull girder section moduli to the hogging and sagging bending moment cases.

2.3 Still water bending moments and shear forces

2.3.1 The design still water hogging and sagging bending moment distribution envelope, M_S , is to be taken as the maximum sagging (negative) and maximum hogging (positive) still water bending moments, calculated at each position along the ship. The maximum moments from all loading conditions are to be used to define the still water bending moment distribution envelope.

2.3.2 It is normal for ships which have a low deadweight requirement or a uniform loading rate in association with a low block coefficient to have a hogging still water bending moment in all conditions of loading. For these ships, the maximum design sagging still water bending moment may be taken as the minimum actual hogging bending moment.

2.3.3 The design still water shear force distribution envelope, Q_S , is to be taken as the maximum positive and negative shear force values, calculated at each position along the ship. The maximum shear forces from all loading conditions are to be used to define the still water shear force distribution envelope.

2.4 Design vertical wave bending moments

2.4.1 The minimum value of vertical wave bending moment, M_w at any position along the ship may be taken as follows:

$$M_w = f_1 f_2 C_2 M_{w0} \text{ kNm(tonne-f m)}$$

where

$$M_{w0} = 0,1 C_1 L^2 B_{WL} (C_b + 0,7) \text{ kNm}$$

$$(M_{w0} = 0,0102 C_1 L^2 B_{WL} (C_b + 0,7) \text{ tonne-f m})$$

B_{WL} = maximum waterline breadth, in metres

= C_1 , C_2 , L and C_b are given in Pt 3, Ch 4, 5 Hull bending strength

= and

f_1 = is given in Pt 3, Ch 4, 5 Hull bending strength

where

f_2 = is the hogging, f_{fH} , or sagging, f_{fS} , correction factor based on the amount of bow flare, stern flare, length and effective buoyancy of the aft end of the ship above the waterline

f_{fS} = is the sagging (negative) moment correction factor and is to be taken as

$f_{fS} = -1,10R_A^{0,3}$ for values of $R_A > 1,0$

$f_{fS} = -1,10$ for values of $R_A \leq 1,0$

f_{fH} = is the hogging (positive) moment correction factor and is to be taken as

$$f_{fH} = \frac{1,9C_b}{(C_b + 0,7)}$$

= R_A is an area ratio factor, see Pt 4, Ch 2, 2.4 Design vertical wave bending moments.

2.4.2 The area ratio factor, R_A , for the combined stern and bow shape is to be derived as follows:

$$R_A = \frac{30(A_{BF} + 0,5A_{SF})}{LB_{WL}}$$

where

A_{BF} = is the bow flare area, in m^2

A_{SF} = is the stern flare area, in m^2

2.4.3 The bow flare area, A_{BF} , is illustrated in Figure 2.2.1 Derivation of bow and stern flare areas and may be derived as follows:

$$A_{BF} = A_{UB} - A_{LB} \text{ m}^2$$

where

A_{UB} = is half the water plane area at a waterline of $T_{C,U}$ of the bow region of the hull forward of $0,8L$ from the AP

A_{LB} = is half the water plane area at the design draught of the bow region of the hull forward of $0,8L$ from the AP

= Note the AP is to be taken at the aft end of L

= The design draught is to be taken as T , see Pt 3, Ch 1, 6.1 Principal particulars.

Alternatively the following formula may be used

$$A_{BF} = 0,005L(b_0 + 2b_1 + b_2) + b_0 a/2 \text{ m}^2$$

where

b_0 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at the FP, in metres, see Figure 2.2.1 Derivation of bow and stern flare areas

b_1 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at $0,9L$ from the AP, in metres

b_2 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at $0,8L$ from the AP, in metres

a = projection of $T_{C,U}$ waterline forward of the FP, in metres

$T_{C,U}$ = is a waterline taken $C_1/2$ m above the design draught

$$T_{C,U} = T + \frac{C_1}{2} \text{ m}$$

C_1 = is given in Pt 3, Ch 4 Longitudinal Strength Table 4.5.1 Wave bending moment factor

= For ships with large bow flare angles above the $T_{C,U}$ waterline the bow flare area may need to be specially considered.

2.4.4 The stern flare area, A_{SF} , is illustrated in Figure 2.2.1 Derivation of bow and stern flare areas and is to be derived as follows:

$$A_{SF} = A_{US} - A_{LS} \text{ m}^2$$

where

A_{US} = is half the water plane area at a waterline of $T_{C,U}$ the stern region of the hull aft of $0,2L$ from the AP

A_{LS} = is half the water plane area at a waterline of $T_{C,L}$ the stern region of the hull aft of $0,2L$ from the AP

$T_{C,L}$ = is a waterline taken $C_1/2$ m below the design draught

$$T_{C,L} = T - \frac{C_1}{2} \text{ m}$$

where

- = For ships with tumblehome in the stern region, the maximum breadth at any waterline less than $T_{C,U}$ is to be used in the calculation of A_{US} . The effects appendages including bossings are to be ignored in the calculation of A_{LS} .

2.4.5 Direct calculation methods may be used to derive the vertical wave bending moments, see Pt 3, Ch 4, 2.5 Direct calculation procedures.

2.4.6 The sagging correction factor, f_{IS} , in the vertical wave bending moment formulation in Pt 4, Ch 2, 2.3 Still water bending moments and shear forces may be derived by direct calculation methods. Appropriate direct calculation methods include a combination of long-term ship motion analysis, non linear ship motion analysis and static balance on a wave crest or trough.

2.5 Design wave shear force

2.5.1 The design vertical wave shear force, Q_w , at any position along the ship is given by:

$$Q_w = 3f_1 K_f M_{wo} / L \text{ kN (tonne - f)}$$

where

- = K_f is to be taken as follows, see also Figure 2.2.2 Shear force factor K_f :

(a) Positive shear force:

$$\begin{aligned} K_f &= 0 \text{ at aft end of } L \\ &= +0,836f_{fH} \text{ between } 0,2L \text{ and } 0,3L \text{ from aft} \\ &= +0,70f_{fH} \text{ between } 0,4L \text{ and } 0,5L \text{ from aft} \\ &= -0,65f_{fS} \text{ between } 0,5L \text{ and } 0,6L \text{ from aft} \\ &= -0,91f_{fS} \text{ between } 0,7L \text{ and } 0,85L \text{ from aft} \\ &= 0 \text{ at forward end of } L \end{aligned}$$

(b) Negative shear force:

$$\begin{aligned} K_f &= 0 \text{ at aft end of } L \\ &= +0,836f_{fS} \text{ between } 0,15L \text{ and } 0,3L \text{ from aft} \\ &= +0,65f_{fS} \text{ between } 0,4L \text{ and } 0,5L \text{ from aft} \\ &= -0,70f_{fH} \text{ between } 0,5L \text{ and } 0,6L \text{ from aft} \\ &= -0,91f_{fH} \text{ between } 0,7L \text{ and } 0,85L \text{ from aft} \\ &= 0 \text{ at forward end of } L \end{aligned}$$

Intermediate values to be determined by linear interpolation.

f_1 , M_{wo} , f_{fS} and f_{fH} are defined in Pt 4, Ch 2, 2.4 Design vertical wave bending moments.

Figure 2.2.2: Shear force factor K_f

2.6 Buckling strength

2.6.1 The buckling requirements in Pt 3, Ch 4, 7 Hull buckling strength are to be applied to plate panels and longitudinals subject to hull girder compression and shear stresses. The design stresses are to be based on the design values of still water and wave bending moments and shear forces and are given in Pt 4, Ch 2, 2.4 Design vertical wave bending moments and Pt 4, Ch 2, 2.5 Design wave shear force.

2.6.2 The standard deduction for corrosion, d_t , to be applied to plating and longitudinals is to be taken in accordance with Table 4.7.1 Standard deduction for corrosion, d_t in Pt 3, Ch 4 Longitudinal Strength.

2.6.3 The buckling factors of safety, λ , to be applied to the corrected critical buckling stress, σ_{CRB} , of plate panels and longitudinals subjected to hull girder compression are given in Table 2.2.1 Buckling factors of safety, λ , where the corrected critical buckling stress is to be determined in accordance with Pt 3, Ch 4, 7.3 Elastic critical buckling stress.

2.6.4 The shear buckling requirements of Pt 3, Ch 4, 7.3 Elastic critical buckling stress are to be applied.

Table 2.2.1: Buckling factors of safety, λ

Structural item	Buckling factor of safety, λ
Longitudinally effective plating	1,0
Longitudinal stiffeners	1,1
when the buckling failure mode of the attached plating is elasto-plastic, see Note	
Longitudinal stiffeners	1,25
when the buckling failure mode of the attached plating is elastic, see Note	
Note The buckling mode of failure of the attached plating is defined as follows:	

Ferries, Roll On-Roll Off Ships and Passenger Ships

Part 4, Chapter 2

Section 3

elastic	$\sigma_E \leq 0,5 \sigma_o$
elasto-plastic	$\sigma_E > 0,5 \sigma_o$
where	
Note	
σ_E = the elastic critical buckling stress, see Pt 3, Ch 4, 7.3 Elastic critical buckling stress	
σ_o = specified minimum yield stress, in N/mm ² (kgf/mm ²).	

Section 3 Deck structure

3.1 Loading

3.1.1 In general, loadings for decks should comply with the requirements of Pt 4, Ch 1 General Cargo Ships except where specified in this Section.

3.1.2 Vehicle decks for the carriage of cars, trucks, etc. are to have a loading for wheeled vehicles as specified in Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles. Where vehicle decks are also used for the carriage of cargo, the loadings derived from Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles are to be not less than would be required by Pt 4, Ch 1 General Cargo Ships.

3.1.3 For ferries and passenger ships classed **100A1**, the minimum design loadings for decks are not to be taken as less than those in Table 2.3.1 Design deck loadings (ferries and passenger ships only).

3.1.4 For ferries and passenger ships classed **100A1** with a specified operating area service notation, the loadings for decks in way of baggage and accommodation spaces are to be in accordance with Table 2.3.1 Design deck loadings (ferries and passenger ships only).

3.1.5 Mooring decks, afterward and forward, other than when part of the strength deck, are to comply with the requirements for forecastles, see Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks. Canopy decks or aprons protecting mooring decks are to be designed using the weather head for forecastle decks reduced by 0,3 m.

3.1.6 For movable decks, see Pt 3, Ch 9, 4 Movable decks.

3.1.7 For train decks, the minimum design loading will be specially considered.

Table 2.3.1: Design deck loadings (ferries and passenger ships only)

Deck	Design pressures P_s , in kN/m ² (tonne-f/m ²)	
	Secondary structures	Primary structures
Decks in way of accommodation and public spaces, see Note	6,38 (0,65)	3,12 (0,32)
Deck supporting baggage spaces	$3,53H_t$ (0,36H _t)	$3,53H_t$ (0,36H _t)

Ferries, Roll On-Roll Off Ships and Passenger Ships

Part 4, Chapter 2

Section 3

Decks in way of stores and refrigerated spaces	14,13 (1,44)	14,13 (1,44)
Decks in way of workshop and machinery spaces (excludes A/C machinery spaces)	18,34 (1,87)	18,34 (1,87)
Magradomes	2,45 (0,25)	2,45 (0,25)
Balconies	3,92 (0,40)	1,96 (0,20)
Weather exposed superstructure decks	2,26 (0,23)	2,26 (0,23)
Weather exposed lifeboat deck	8,44 (0,86)	8,44 (0,86)
Symbols		
H_t = 'tween deck height, in metres		
Note The design pressure, P_s , may be reduced by 12 per cent for ferries and passenger ships with a specified operating area service notation.		

Table 2.3.2: Thickness of deck plating

Deck location	Plating thickness (mm)
Accommodation and public spaces	$t = 0,008s \sqrt{k}$
Baggage handling and storage	$t = 0,009s \sqrt{k}$
Storerooms	$t = 0,01s \sqrt{k}$
Workshops and machinery spaces	$t = 0,01s \sqrt{k}$
Weather exposed lifeboat deck	$t = 0,00083s_1 \sqrt{Lk} + 2,5$
The thickness of deck plating is in no case to be less than 5,0 mm	

3.2 Deck plating

3.2.1 For ferries and passenger ships classed **100A1** the minimum thicknesses of decks are to be in accordance with Table 2.3.2 Thickness of deck plating.

3.2.2 For roll on-roll off cargo ships, the thickness of deck plating (other than for vehicle decks) will generally be in accordance with Pt 4, Ch 1 General Cargo Ships.

3.2.3 Where decks are required to resist hull girder bending, the thickness is to satisfy the requirements of Pt 3, Ch 4, 7 Hull buckling strength.

3.2.4 Where deck plating is required to form the effective flange of deck primary members, the thickness may need to be increased locally taking account of the compressive forces acting, see also Pt 3, Ch 10 Welding and Structural Details, Table 10.4.1 Minimum thickness of primary members.

Ferries, Roll On-Roll Off Ships and Passenger Ships

Part 4, Chapter 2

Section 3

3.2.5 Vehicle deck plating is to satisfy the requirements for plating loaded by wheeled vehicles as specified in Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles. Where vehicle decks are also to be used for the carriage of cargo, the thickness of plating derived from Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles is to be not less than would be required by Pt 4, Ch 1, 4.2 Deck plating.

3.2.6 The thickness of all other decks will generally be in accordance with Pt 4, Ch 1 General Cargo Ships.

3.3 Deck stiffening

3.3.1 For ferries, roll on-roll off cargo ships and passenger ships, the deck stiffening (other than for vehicle decks) will generally be in accordance with Pt 4, Ch 1 General Cargo Ships. However, in view of the complexity of some multi-deck arrangements in association with large freeboards, deck stiffening may require special consideration.

3.3.2 Vehicle deck beams and longitudinals are to have scantlings in accordance with the requirements for wheeled vehicles as specified in Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles. Where vehicle decks are also to be used for the carriage of cargo, the scantlings derived from Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles are to be not less than would be required by Pt 4, Ch 1, 4.3 Deck stiffening.

3.3.3 In multi-decked ships with high freeboards, the section modulus of deck beams and longitudinals is to be not less than the value given by Table 2.3.3 Modulus of deck beams and longitudinals for multi-decked ships with high freeboards.

Table 2.3.3: Modulus of deck beams and longitudinals for multi-decked ships with high freeboards

Position of beam/longitudinal	Modulus, in cm ³
Decks, excluding those for the stowage of cargo or vehicles	$Z = 0,00083 f_R P_s l_e^2 s k$ $(Z = 0,0081 f_R P_s l_e^2 s k)$ but not less than: $Z = 0,025s$
Symbols	
l_e, s, Z , and k as defined in Pt 4, Ch 1, 1.5 Symbols and definitions P_s = deck loading, in kN/m ² (tonne-f/m ²), see Table 2.3.1 Design deck loadings (ferries and passenger ships only). f_R = 1, for ships with unrestricted service f_R = 0,81 for ships with a specified operating area service notation	

3.4 Deck supporting primary structure

3.4.1 The section modulus of primary members supporting four or more point loads or a uniformly distributed load is not to be taken as less than:

$$Z = 0,0673 S P_s k l_e^2 (\text{cm}^3)$$

$$(Z = 6,60 S P_s k l_e^2) (\text{cm}^3)$$

where

= l_e , S , Z , and k are as defined in Pt 4, Ch 1, 1.5 Symbols and definitions

P_s = deck design loading, in kN/m² (tonnes/m²), see Table 2.3.1 Design deck loadings (ferries and passenger ships only).

3.4.2 The moment of inertia of primary members supporting more than four point loads is not to be taken as less than:

$$I = \frac{1,85}{k} l_e Z (\text{cm}^4)$$

= Z and l_e as defined in Pt 4, Ch 2, 3.4 Deck supporting primary structure.

3.4.3 Scantlings of primary structure are to be verified for the following cases using direct calculation methods.

- (a) The structural support arrangement is complex either due to arrangement or loading pattern.
- (b) Large openings are incorporated in the webs of primary members.
- (c) The structure is of novel or unusual design.

The stress criteria in Table 1.4.6 Deck girders, transverses and hatch beams in Chapter 1 are to be complied with.

3.4.4 Direct calculations should be carried out in accordance with the SDA procedure relevant to the ship type.

3.4.5 Vehicle deck structure is to be of adequate strength for the upward forces imposed at fixed securing points. Local reinforcement is to be fitted as necessary.

Section 4 Shell envelope plating

4.1 Bottom and side shell

4.1.1 For ferries and passenger ships classed **100A1** with a specified operating area service notation the keel thickness for 0,4L amidships is to be as required by Pt 4, Ch 1, 5 Shell envelope plating. At ends, the keel thickness may be reduced by 25 per cent from the above value, but is to be not less than that of the adjacent shell plating.

4.1.2 The thickness of side shell plating above 1,6T including superstructures may require special consideration depending on the particular structural arrangement, hull vertical bending and shear stresses and position of the shell above the waterline. In no case are the shell scantlings above 1,6T to be less than the following:

(a)
$$t_{zm} = t_{shell} - (Z_m - 1,6T)(0,24 + 0,0012L) \sqrt{\frac{k s_1}{s_b}}$$

(b)
$$t_{zm} = (4 + 0,02L) \sqrt{\frac{k s_1}{s_b}}$$

(c) as required by Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks

where

t_{shell} = minimum required shell thickness above D/2 for the specific location, as calculated in Pt 4, Ch 1, 5 Shell envelope plating

t_{zm} = minimum shell thickness at Z_m

Z_m = vertical height in metres above base

= L and T as defined in Pt 3, Ch 1, 1.5 Intact stability.

= s_1 , s_b as defined in Table 5.3.1 Shell plating forward in Pt 3, Ch 5 Fore End Structure for fore end or Table 6.3.1 Shell plating aft in Pt 3, Ch 6 Aft End Structure for aft end.

4.1.3 Openings in the side shell and superstructure plating for windows and doors are to be suitably stiffened and the thickness and grade of plating in way will be specially considered.

4.1.4 For ships with broad flat counter stern sections which are liable to be subjected to large wave impact loading, the effect of wave impact loading on the plating and framing of the local shell structure is to be additionally considered, see Pt 4, Ch 2, 4.3 Strengthening for wave impact loads and Pt 4, Ch 2, 5.2 Strengthening for wave impact loads.

Ferries, Roll On-Roll Off Ships and Passenger Ships

Part 4, Chapter 2

Section 4

4.1.5 The plating and framing of the forward shell structure for ships with significant bow flare is to be additionally considered with regard to wave impact loading, see Pt 4, Ch 2, 4.3 Strengthening for wave impact loads and Pt 4, Ch 2, 5.2 Strengthening for wave impact loads.

4.1.6 The minimum thickness of the shell plating at ends and for taper is to be not less than the values given in Table 2.4.1 End shell thickness, and is in no case to be less than 6 mm.

4.1.7 For ferries and passenger ships classed **100A1** with a specified operating area service notation, the bottom and side shell minimum thickness at ends may be taken 20 per cent less than that required by Table 2.4.1 End shell thickness and Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure, but is in no case to be less than 6 mm.

Table 2.4.1: End shell thickness

Scantling length	Thickness, in mm
70 m and below	$(6,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}} - 1,0$
Between 70 m and 110 m	$(6,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}} - 0,5$
Over 110 m	Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure
Symbols	
L as defined in Pt 3, Ch 1, 1.5 Intact stability	
s ₁ , s _b as defined in Table 5.3.1 Shell and deck plating in Pt 3, Ch 5 Fore End Structure for fore end or Table 6.3.1 Shell plating aft in Pt 3, Ch 6 Aft End Structure for aft end	

4.2 Bow flare and wave impact pressures

4.2.1 This Section is applicable to:

- (a) bow flare region;
- (b) sides and undersides of sponsons; and
- (c) other parts of the side shell plating close to and above the design waterline that are expected to be subjected to wave impact pressures.

The wave impact pressure, P_{bf} , in kN/m² due to relative motion is to be taken as:

$$= P_{bf} = 0,5 \left(K_{bf} V_{bf}^2 + K_{rv} H_{rv} V_{rv}^2 \right) \text{ kN/m}^2$$

where

K_{bf} = hull form shape coefficient for wave impacts

$$= \frac{\pi}{\tan \psi} \text{ for } \psi \geq 10$$

$$= 28 (1 - \tan (2\psi)) \text{ for } \psi < 10$$

V_{bf} = wave impact velocity, in m/s, and is given by

$$= \sqrt{V_{thbf}^2 + 2m_1 \ln(N_{bf})} \text{ for } N_{bf} \geq 1$$

$$= 0 \text{ for } N_{bf} < 1$$

V_{thbf} = threshold velocity for wave impact, in m/s, to be taken as:

Ferries, Roll On-Roll Off Ships and Passenger Ships

Part 4, Chapter 2

Section 4

where

$$= \frac{\sqrt{10}}{\cos \alpha_p}$$

$\ln ()$ is the natural logarithm

N_{bf} = No. of wave impacts in a three hour period and is given by

$$= 1720 PR_{bf} \sqrt{\frac{m_1}{m_0}}$$

PR_{bf} = probability of a wave impact and is given by

$$= e^{-u}$$

$$u = \left(\frac{Z_{wl}^2}{2m_0} + \frac{V_{thbf}^2}{2m_1} \right)$$

Z_{wl} = distance of the centroid of the area of plating or stiffener above the local design waterline

m_1 = variance of the relative vertical velocity

$$= 0,25(\omega_e f_{sl} H_{rm})^2$$

m_0 = variance of the relative vertical motion

$$= 0,25 (f_{sl} H_{rm})^2$$

ω_e = effective encounter wave frequency

$$= \omega \left(1 + \frac{0,4q \omega V_{sl}}{g} \right)$$

= where

$$q = 1,0 \text{ for } \frac{x}{L} \geq 0,5$$

$$= -0,6 \text{ for } \frac{x}{L} < 0,5$$

ω = effective wave frequency based on 80 per cent ship length

$$= \sqrt{\frac{2 \pi g}{0,8L_{WL}}}$$

f_{sl} = probability level correction factor for relative vertical motion

$$= 1,0 \text{ for } C_b \leq 0,6$$

$$= 1,2 \text{ for } C_b > 0,6$$

V_{sl} = 0,515V, in m/s

K_{rv} = hull form shape coefficient for impact due to forward speed

$$= \frac{\pi}{\tan(90 - \alpha_p)} \text{ for } \alpha_p \leq 80$$

$$= 28 (1 - \tan(2(90 - \alpha_p))) \text{ for } \alpha_p > 80$$

H_{rv} = relative wave heading coefficient

$$= \text{for } \frac{x}{L} \geq 0,5$$

$$= 1 \text{ for } \gamma_p > 45$$

$$= \cos(45 - \gamma_p) \text{ for } \gamma_p \leq 45$$

where

$$= \text{for } \frac{x}{L} < 0,5$$

$$= 0$$

= The point at which the following angles are to be measured for assessment of plating and stiffeners is detailed in Table 2.4.2 Positions at which α_p , β_p and γ_p are to be measured :

V_{rv} = relative forward speed, in m/s

$$= 0,515V \sin \gamma_p$$

α_p = buttock angle measured in the longitudinal plane, in degrees, see Figure 2.4.1 Bow flare and bottom slamming angles and Table 2.4.2 Positions at which α_p , β_p and γ_p are to be measured

ψ = effective deadrise angle, in degrees

For $C_b > 0,6$, ψ is to be taken as the maximum of α_p and β_p , see Figure 2.4.1 Bow flare and bottom slamming angles and Table 2.4.2 Positions at which α_p , β_p and γ_p are to be measured

For $C_b \leq 0,6$, ψ is to be taken as the maximum of α_p and β

= where

β = $\beta_p - 10^\circ$, but is to be taken as not less than 0°

= NOTE

= The 10° deduction is to allow for the effects of roll motion on the impact pressures.

γ_p = waterline angle measured in the horizontal plane, in degrees, see Figure 2.4.1 Bow flare and bottom slamming angles and Table 2.4.2 Positions at which α_p , β_p and γ_p are to be measured .

= NOTE

= Where only two angles are known and are measured in orthogonal planes, the third angle may be obtained by the following expression:

$$\alpha_p = \tan^{-1} (\tan \beta_p \tan \gamma_p)$$

The relative vertical motion, H_{rm} , is to be taken as

$$H_{rm} = C_{w,min} \left(1 + \frac{4,5}{(C_b + 0,2)} \left(\frac{X_{WL}}{L_{WL}} - x_m \right)^2 \right)$$

where

$$C_{w,min} = \frac{C_w}{\sqrt{2k_m}}$$

C_w = a wave head in metres

$$= 0,0771 L_{WL} (C_b + 0,2)^{0,3} e^{(-0,0044 L_{WL})}$$

$$k_m = \frac{4,5(0,5 - x_m)^2}{1 + \frac{(C_b + 0,2)}{2}}$$

x_m = $0,45 - 0,6F_n$ but is not to be less than 0,2

$$F_n = \frac{0,515V}{\sqrt{gL_{WL}}}$$

L_{WL} = waterline length at summer load draught

X_{WL} = longitudinal distance, in metres, measured forwards from the aft end of the L_{WL} to the location being considered

where

V = speed, in knots

= for $\frac{x}{L} \geq 0,5$

= is to be taken as the maximum service speed, in knots, as defined in Pt 3, Ch 1, 6 Definitions For passenger yachts not required to maintain high speeds in severe weather, the value of V may be specially considered, but is not to be taken as less than the greater of $\frac{V}{3}$ or 5 knots. Where V has been specially considered it is to be noted in the classification records as a memorandum that should state: "A design speed of ... knots has been used for the assessment of bow structure with regards to bow flare impacts. It should be noted that this speed may not be appropriate for all conditions and it is the responsibility of the Master to apply good Seamanship to minimise bow flare slamming."

= for $\frac{x}{L} < 0,5$

= 0 knots, for passenger ships

= 5 knots, for all other ship types

C_b = Rule block coefficient.

Table 2.4.2: Positions at which α_p , β_p and γ_p are to be measured

Framing system	Plating	Secondary stiffeners
Longitudinally framed	Mid-distance between longitudinals	Mid-distance between frames
Transversely framed	0,5s from the bottom edge of the plate strake or primary member	Mid-distance between primary members

4.2.2 Alternatively, P_{bf} may be derived by the direct calculations carried out in accordance with a procedure agreed by LR.

4.3 Strengthening for wave impact loads

4.3.1 The shell envelope in the forward and after portions of the hull are to be strengthened against bow flare or wave impact pressure. Typically, strengthening is to be considered over the following areas:

- over the after body in way of a flat counter stern which is close to the waterline;
- over the fore end side and bow structure above the waterline and up to the deck at side;
- other areas where the hull exhibits significant flare.

Figure 2.4.1: Bow flare and bottom slamming angles

4.3.2 The thickness of the side shell plating is to be not less than:

$$t = 3,2s_c\sqrt{kh_s}C_R \times 10^{-2} \text{ mm}$$

where

s_c = is the length of the shorter edge of a plating panel framed by primary and secondary members, see Figure 2.4.2 Chord spacing and mean chord spacing for secondary members

h_s = equivalent wave impact head, in metres

$$h_s = 0,1 P_{bf} \text{ m}$$

P_{bf} = is defined in Pt 4, Ch 2, 4.2 Bow flare and wave impact pressures

C_R = panel ratio factor

$$C_R = \left(\frac{l}{s_c}\right)^{0,41} \text{ but is not to be taken less than } 0,06 \text{ or greater than } 0,1$$

l = overall panel length, in metres, measured along a chord between the primary members.

4.3.3 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered to meet the normal shell envelope requirements.

4.3.4 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships.

Figure 2.4.2: Chord spacing and mean chord spacing for secondary members

Section 5 Shell envelope framing

5.1 Side structure

5.1.1 The scantlings of frames, or side longitudinals, web frames or transverses, and stringers below 1,6*T* above base are to satisfy the requirement of Pt 4, Ch 1 General Cargo Ships and this Section, but may be required to be confirmed by direct calculation. The scantlings of these members above 1,6*T* from base may require special consideration on the basis of the particular structural arrangements, design deck loading, hull vertical bending stresses, and position of the member above the waterline.

5.1.2 The scantlings of side transverses supporting shell longitudinals above 1,6*T* are to satisfy the requirements of:

- (a) Pt 4, Ch 1, 6 Shell envelope framing, Pt 3, Ch 5, 4 Shell envelope framing and Pt 3, Ch 6, 4 Shell envelope framing.
- (b) The minimum geometric properties required in order to provide rotational constraint to the end of the deck transverse in way:

$$Z_s = \frac{0,677SkP_sL_d^3}{\left(\left(\frac{I_d}{I_s}\right)L_s + L_d\right)} \text{ cm}^3$$

but is not to be less than $0,339SkP_sL_d^2 \text{ cm}^3$

I_s is not to be less than $I_d \left(\frac{L_s}{L_d}\right) \left(\frac{Z_{dR}}{Z_d}\right) \text{ cm}^4$

where

P_s = deck design loading, in kN/m², see Table 2.3.1 Design deck loadings (ferries and passenger ships only)

L_d = span of adjacent deck transverse, in metres

Z_d = actual modulus of adjacent deck transverse, in cm³

Z_{dR} = Rule modulus of adjacent deck transverse, in cm³

I_d = moment of inertia of adjacent deck transverse, in cm⁴

L_s = span of side shell transverse, in metres

I_s = moment of inertia of side shell transverse, in cm⁴

where

S, k = as defined in Pt 4, Ch 2, 1.5 Symbols

= Due account should be taken of the shell window dimensions when determining the effective width of attached plating.

5.1.3 The required modulus of transverse main and 'tween deck frames, which may have reasonably constant convex curvature over their entire length, may be corrected for curvature as follows:

$$Z_{\min} = Z_{\text{rule}} \left(\frac{1}{\cosh\left(\frac{2\pi Y_c}{l_e}\right)} \right)^3 \text{ cm}^3$$

where

Z_{rule} = modulus requirement, in cm^3 , from Pt 4, Ch 1 General Cargo Ships using l_e

l_e = distance between span support points, in metres, as shown in Figure 2.5.1 Distance between span support points and curvature

Y_c = curvature measured from a line intersecting the end support points to the frame at mid-span, in metres, as shown in Figure 2.5.1 Distance between span support points and curvature

Z_{\min} = is not to be less than $0,5Z_{\text{rule}}$.

Figure 2.5.1: Distance between span support points and curvature

5.1.4 Where ramp openings are fitted adjacent to the ship's side, adequate support for the side framing is to be provided.

5.2 Strengthening for wave impact loads

5.2.1 The side structure in the forward and after portions of the hull is to be strengthened against bow flare or wave impact pressure. Typically, strengthening is to be considered over the following areas:

- over the after body in way of a flat counter stern which is close to the waterline.
- over the fore end side and bow structure above the waterline and up to the deck at side.
- other areas where the hull exhibits significant flare.

5.2.2 The scantlings of secondary stiffeners are not to be less than:

(a) Effective plastic section modulus of stiffeners:

$$Z_p = 3,75 h_s s_{cm} k l_e^2 \times 10^{-3} \text{ cm}^3$$

where

h_s = wave impact head, in metres, as defined in Pt 4, Ch 2, 4.3 Strengthening for wave impact loads

where

s_{cm} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 2.4.2 Chord spacing and mean chord spacing for secondary members

Other symbols are as defined in Pt 4, Ch 2, 1.5 Symbols.

(b) Web area of secondary stiffeners

$$A = 3,7 s_{cm} k h_s \left(l_e - \frac{s_{cm}}{2000} \right) \times 10^{-4} \text{ cm}^2$$

where

s_{cm} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 2.4.2 Chord spacing and mean chord spacing for secondary members

h_s = wave impact head, in metres, as defined in Pt 4, Ch 2, 4.3 Strengthening for wave impact loads

Other symbols are as defined in Pt 4, Ch 2, 1.5 Symbols.

5.2.3 The effective section properties of secondary stiffeners are to be taken as:

(a) Plastic section modulus of secondary stiffeners, Z_p , is to be taken as:

$$\begin{aligned} Z_p &= 2,8 \times 10^{-4} s_{cm} t_p^2 - 10^{-3} b_f b_{fc} t_f \sin \theta_e + 5 \times \\ &= 10^{-4} (h_w^2 t_w + 2 b_f t_f h_w) \cos \theta_e \text{ cm}^3 \end{aligned}$$

where

$$\theta_e = C_0 (90 - \varphi)$$

$$C_0 = 1,1$$

φ = the angle between the stiffener and the side shell, in degrees

$$b_{fc} = 0,5 (b_f - t_w) \text{ for L profiles}$$

$$= 0 \text{ for flat bar and T profiles}$$

$$= \text{see Figure 4.7.1 Dimensions of longitudinals in Pt 3, Ch 4 Longitudinal Strength, for bulb profiles}$$

h_w = height of stiffener web, in mm

t_w = web thickness, in mm

b_f = breadth of flange, in mm

t_f = flange thickness, in mm

t_p = thickness of attached plating, in mm

(a) Web area of secondary stiffeners, A_s , is to be taken as:

$$A_s = 0,01 (h_w + t_p) t_w \sin \varphi \text{ cm}^2$$

5.2.4 Where the stiffener web is not perpendicular to the plating, tripping brackets have to be fitted in order to obtain adequate lateral stability.

5.2.5 The scantlings of primary members are not to be less than:

(a) Section modulus of primary members

$$Z = 2 \gamma_z k h_s q v l_e^2 \text{ cm}^3$$

(b) Web area of primary members

$$A = 0,2 \gamma_A k h_s q v l_e \text{ cm}^2$$

where

h_s = wave impact head, in metres, as defined in Pt 4, Ch 2, 4.3 Strengthening for wave impact loads

= and

γ_A and γ_Z are strength factors dependent on the load position

for $q < 1$ $\gamma_A = q^3 - 2q^2 + 2$ and $\gamma_Z = 3q^3 - 8q^2 + 6q$

for $q = 1$ $\gamma_A = 1$ and $\gamma_Z = 1$

$$q = \frac{u}{l_e} \text{ but } \leq 1$$

for web frames:

u = is the minimum of g_{bfv} or l_e

v = is the minimum of g_{bfh} or S_{cm}

for primary stringers:

u = is the minimum of g_{bfh} or l_e

v = is the minimum of g_{bfv} or S_{cm}

where

l_e = is the effective length of the primary member, in metres

S_{cm} = is the mean spacing between primary members along the plating, in metres, see Figure 2.5.2 Mean spacing between primary members, S_{cm} , and the extents of wave impact pressure g_{bfh} and g_{bfv}

= g_{bfv} and g_{bfh} are defined in Pt 4, Ch 2, 5.2 Strengthening for wave impact loads

= Other symbols are as defined in Pt 4, Ch 2, 1.5 Symbols.

(a) The web of the primary member is to be adequately stiffened.

Figure 2.5.2: Mean spacing between primary members, S_{cm} , and the extents of wave impact pressure g_{bfh} and g_{bfv}

5.2.6 The extents of the wave impact pressure are to be derived as follows:

- (a) the vertical extent, g_{bfv} , is to be taken as:

$$g_{bfv} = \frac{4}{\sin \psi \sqrt{8K_{bf}}} \text{ m}$$

- (b) the horizontal extent, g_{bfh} , is to be taken as:

$$g_{bfh} = 4 \text{ m}$$

where

K_{bf} and ψ are given in Pt 4, Ch 2, 4.2 Bow flare and wave impact pressures.

5.2.7 For primary members with cut-outs for the passage of secondary stiffeners, and which may have web stiffeners connected to the secondary stiffener, buckling checks are to be carried out to ensure that the primary member web plating and web stiffener will not buckle under the design load. The buckling procedure to be followed is given in Table 5.1.3 Buckling procedure for primary member web plating and web stiffener in Pt 3, Ch 5 Fore End Structure. Where the web stiffener is fitted with a bracket, the buckling capability of the web stiffener in way of the cut-out is to take account of the bracket. Where no web stiffener is fitted, the buckling capability of the primary member web plating is to be checked for the total load transmitted to the connection.

5.2.8 Where the angle between primary structure web and the plating is less than 70°, the effective section modulus and shear area are to take account of the non-perpendicularity.

5.2.9 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered to meet the normal shell envelope requirements.

5.2.10 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of Pt 4, Ch 2 Ferries, Roll On-Roll Off Ships and Passenger Ships.

■ Section 6

Double bottom

6.1 General

6.1.1 A double bottom is to be fitted in accordance with Pt 4, Ch 1, 8 Double bottom structure.

6.1.2 Where podded drive systems are to be employed, adequate floors and girders are to be arranged in order to efficiently integrate the unit into the aft structure. The adequacy of the hull structure supporting the unit is to be verified using the maximum external forces and moments stated by the manufacturer. Due account is to be taken of additional forces induced by ship motion accelerations.

6.2 Transmission of pillar loads

6.2.1 In ships where the deck centreline supports are widely spaced, transmission of the pillar loads to the double bottom structure will be specially considered, and additional reinforcement may be required if high shear and bending stresses are induced by the concentrated loads. The reinforcement should take the form of additional floors, and fore and aft girders. The final reinforcement is to be confirmed by direct calculation.

6.2.2 Where, in multi-decked passenger ships, the Rule deck loadings from Table 2.3.1 Design deck loadings (ferries and passenger ships only) have been used to determine the primary deck supporting structure, the cumulative pillar load P_p may be taken as:

$$P_p = \sum (b_p S_p) P_s \text{ kN}$$

where

b_p = breadth of deck supported by pillar

S_p = mean spacing between pillars

P_s = see Table 2.3.1 Design deck loadings (ferries and passenger ships only).

6.2.3 Pillars are to be provided with suitable pads at their heels. Long pillars, and those terminating at the inner bottom are to be bracketed. At pillar heads, the free edges of deck primary structure face plates are to be at least 20 mm clear of the pillar head attachment weld. Where necessary, gusset plates are to be fitted at primary member intersections in way of pillars. These gussets may be applied as doublers onto the primary member face plates and should be at least equal in thickness to the pillar or the face plate, whichever is greater. Where pillars act in tension, the gussets are to be integral with the primary member face plates. The axial stress in tensile pillars is not to exceed 110/k N/mm² and full penetration welds are to be arranged in way of the end connections.

6.3 Ferries and passenger ships with a specified operating area service

6.3.1 The thickness of double bottom centre girders may be reduced by 10 per cent, and the thickness of double bottom side girders and floors may be reduced by five per cent, from the values required by Pt 4, Ch 1, 8 Double bottom structure, but is in no case to be less than 6 mm.

■ **Section 7****Peak, watertight and deep tank bulkheads****7.1 General**

7.1.1 The scantlings of watertight and deep tank bulkheads are to comply with the requirements of Pt 4, Ch 1 General Cargo Ships.

7.1.2 The load head, h_4 to be used in watertight bulkhead scantlings for passenger ships is, in addition, to comply with the following:

- For watertight bulkhead plating, the distance from a point one-third of the height of the plate above its lower edge to a point 0,91 m above the bulkhead deck at side, or to the deepest intermediate/equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater.
- For watertight bulkhead stiffeners or girders, the distance from the middle of the effective length to a point 0,91 m above the bulkhead deck at side, or to the deepest intermediate/equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater.

7.1.3 Partial watertight bulkheads and webs fitted above the bulkhead deck which are to be included in damage stability calculations, are to be assessed as watertight, see Pt 4, Ch 2, 7.1 General.

7.2 Ferries and passenger ships with a specified operating area service

7.2.1 The thickness of bulkhead plating for peak tanks and deep tanks, other than the collision bulkhead, may be reduced by 0,5 mm, and the modulus of bulkhead stiffeners, swedges, corrugations and girders may, in general, be reduced by 20 per cent from the values required by Pt 4, Ch 1, 9 Bulkheads.

■ **Section 8****Bow doors and inner doors****8.1 Symbols**

8.1.1 The symbols used in this Section are defined as follows:

a = vertical distance, in metres, from the bow door pivot to the centroid of the vertical projected area of bow door, see Figure 2.8.1 Bow door (upward hinging)

b = horizontal distance, in metres, from the bow door pivot to the centroid of the horizontal projected area of bow door, see Figure 2.8.1 Bow door (upward hinging)

c = horizontal distance, in metres, from bow door pivot to centre of gravity of bow door, see Figure 2.8.1 Bow door (upward hinging)

d = vertical distance, in metres, from bow door pivot to the centre of gravity of the bow door, see Figure 2.8.1 Bow door (upward hinging)

h = height of the door, in metres, between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser, see Figure 2.8.2 Definition of α and β

k = material factor (see Pt 3, Ch 2, 1.2 Steel), but is not to be taken less than 0,72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure

l = projected length, in metres, of the door at a height of $\frac{h}{2}$ above the bottom of the door, see Figure 2.8.2 Definition of α and β

w = width of bow door at half height, in metres

A_z = area, in m^2 , of the horizontal projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Figure 2.8.1 Bow door (upward hinging). Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser

A_s = area of stiffener web, in cm^2

A_x = area, in m^2 , of the transverse vertical projection of the bow door, between the bottom of the door and the top of the door or between the bottom of the door and the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Figure 2.8.1 Bow door (upward hinging) Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded

A_y = area, in m^2 , of the longitudinal vertical projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Figure 2.8.1 Bow door (upward hinging) Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser

W = weight of bow visor, in tonnes

q = distance, in metres, from the centroid of the hydrostatic head profile, to the top of the cargo space

C_H = 0,0125 L where $L < 80$ m
= 1,0 where $L \geq 80$ m

L = length of ship, but need not be taken greater than 200 m

V = as defined in Pt 4, Ch 2, 1.5 Symbols

λ = coefficient depending on the area where the ship is intended to be operated
= 1,0 for sea-going ships
= 0,8 for ships operated in coastal waters
= 0,5 for ships operated in sheltered waters

σ = bending stress, in N/mm^2 (kgf/mm^2)

σ_e = equivalent stress, in N/mm^2 (kgf/mm^2)
= $\sqrt{\sigma^2 + 3\tau^2}$

σ_y = yield stress of the bearing material, in N/mm^2 (kgf/mm^2)

τ = shear stress, in N/mm^2 (kgf/mm^2).

Figure 2.8.1: Bow door (upward hinging)

Figure 2.8.2: Definition of α and β

8.2 General

8.2.1 Bow doors are defined by the following types:

- (a) Visor doors opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms.
- (b) Side-opening doors opened either by rotating outwards about a vertical axis through two or more hinges located near the outbound edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the ship. It is expected that side-opening bow doors will be arranged in pairs.

Other bow door types will be specially considered.

8.2.2 Bow doors are to be situated above the freeboard deck. A watertight recess in the freeboard deck located forward of the collision bulkhead and above the deepest waterline, fitted for arrangement of ramps or other related mechanical devices, may be regarded as a part of the freeboard deck for the purpose of this requirement.

8.2.3 Where bow doors lead to a complete or long forward enclosed superstructure, or to a long non-enclosed superstructure which is fitted to attain minimum bow height equivalence, an inner door is to be fitted. The inner door is to be part of the collision bulkhead. Where a sloping vehicle ramp forming the collision bulkhead above the freeboard deck is arranged, the inner door may be omitted if the ramp is weathertight over its complete length and fulfils the requirements of Pt 3, Ch 3 Structural Design concerning the position of the collision bulkhead.

8.2.4 Bow doors are to be fitted with arrangement for ensuring weathertight sealing, such as gaskets, and to give effective protection to inner doors.

8.2.5 Inner doors forming part of the collision bulkhead are to be watertight over the full height of the cargo space and arranged with fixed sealing supports on the aft side of the doors.

8.2.6 Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a second separate inner weathertight door, complying with Pt 4, Ch 2, 8.2 General, is to be installed.

8.2.7 The requirements for inner doors are based on the assumption that vehicles and cargo are effectively lashed and secured against movement from the stowed position.

8.2.8 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined as follows:

- (a) A securing device is used to keep the door closed by preventing it from rotating about its hinges.
- (b) A supporting device is used to transmit external and internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.
- (c) A locking device locks a securing device in the closed position.

8.2.9 The scantlings and arrangements of side shell and stern doors are to be in accordance with the requirements of Pt 3, Ch 11, 8 Side and stern doors and other shell openings.

8.3 Scantlings

8.3.1 The strength of the bow door is to be equivalent to the surrounding structure, as given in Pt 3, Ch 5, 6 Fore peak structure.

8.3.2 For bow doors, including bulwark, of unusual form or proportions, the areas and angles used for the determination of design values of external forces are to be specially considered.

8.3.3 Bow doors of the visor or hinged opening type are to be adequately stiffened, and means are to be provided to prevent lateral or vertical movement of the doors when closed. Care is to be taken to ensure that adequate strength is provided in the connections of the hinge or linking arms to the door structure and to the ship structure.

8.3.4 The thickness of the bow door plating is not to be less than the side shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum shell plate end thickness or forecastle side thickness as appropriate.

8.3.5 The section modulus of horizontal or vertical stiffeners is not to be less than required for end framing. Consideration is to be given, where necessary, to differences in fixity between ship frames and bow door stiffeners.

8.3.6 The stiffener webs are to have a net sectional area not less than:

$$A_s = \frac{10Q}{\tau} \text{ cm}^2$$

$$\tau \text{ is to be taken as } \frac{100}{k} \text{ N/mm}^2 \left(\frac{10,2}{k} \text{ kgf/mm}^2 \right)$$

where

Q = shear force, in kN (tonne-f) calculated using the uniformly distributed external sea pressure, p_e , defined in Pt 4, Ch 2, 8.6 Design of securing and supporting devices

8.3.7 Bow door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.

8.3.8 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load, P_e , is the uniformly distributed external sea pressure. The formulae for P_e given in Pt 4, Ch 2, 8.6 Design of securing and supporting devices, may be used with α and β defined as:

α = flare angle, in degrees, generally to be measured normal to the shell between the vertical axis and the vertical tangent to the outer shell of the door measured at the point on the bow door, one half of the projected length ($l/2$) aft of the stern line on the plane at the half height of the door ($h/2$) (see Figure 2.8.2 Definition of α and β)

β = entry angle, in degrees, generally to be measured on the outer shell of the door between the longitudinal axis and the waterplane tangent measured at the point on the bow door, one half of the projected length ($l/2$) aft of the stern line on the plane at the half height of the door ($h/2$) (see Figure 2.8.2 Definition of α and β)

The permissible stresses are as follows:

$$\tau = \frac{80}{k} \text{ N/mm}^2 \left(\frac{8,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2 \left(\frac{12,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2 \left(\frac{15,3}{k} \text{ kgf/mm}^2 \right)$$

8.3.9 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

8.3.10 The primary members of the bow doors and hull structure in way are to have sufficient stiffness to ensure the integrity of the boundary support of the doors.

8.3.11 All load transmitting elements in the design load path, from door through securing arrangements and supporting devices into the ship structure, including welded connections, are to be to the same strength standard. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

8.3.12 For bow doors and inner doors, the distribution of forces acting on the securing devices and the supporting devices is to be supported by direct calculations taking into account the flexibility of the structure and the actual position and stiffness of the supports.

8.3.13 The buckling strength of primary members is to be specially considered.

8.4 Vehicle ramps

8.4.1 Where doors also serve as vehicle ramps, the scantlings are to be not less than would be required by Pt 4, Ch 2, 3.2 Deck plating and Pt 4, Ch 2, 3.3 Deck stiffening and where they form part of the collision bulkhead the arrangement is to be in accordance with Pt 3, Ch 3, 4.5 Watertight recesses, flats and loading ramps.

8.5 Arrangements for the closing, securing and supporting of doors

8.5.1 Bow doors are to be fitted with adequate means of closing, securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the bow doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing

material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Maximum design clearance between securing and supporting devices is not to exceed 3 mm.

8.5.2 Securing devices are to be simple to operate and easily accessible. They are to be of a design approved by LR for the intended purpose.

8.5.3 Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.

8.5.4 Systems for door opening/closing and securing/locking are to be interlocked in such a way that they can only operate in a proper sequence. Hydraulic systems are to comply with Pt 5, Ch 14, 14 Hydraulic systems.

8.5.5 Means are to be provided to enable the bow doors to be mechanically fixed in the open position taking into account the self-weight of the door and a minimum wind pressure of 1,5 kN/m² (0,153 tonne-f/m²) acting on the maximum projected area in the open position.

8.5.6 The spacing for side and top cleats should not exceed 2,5 m and there should be cleats positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

8.5.7 Control and monitoring arrangements are to comply with Pt 6, Ch 2, 19 Ship safety systems.

8.6 Design of securing and supporting devices

8.6.1 The external design forces for securing devices, supporting devices and surrounding structure are to be taken not less than P , taking the direction of the pressure into account:

$$P_x = A_x p_e$$

$$P_y = A_y p_e$$

$$P_z = A_z p_e$$

where

p_e = external sea pressure, not to be taken less than:

(a) For bow doors:

$$\begin{aligned} p_e &= 0,8 (0,15V + 0,6 \sqrt{L})^2 \text{ kN/m}^2 \\ &= (0,082 (0,15V + 0,6 \sqrt{L})^2 \text{ tonne-f/m}^2) \end{aligned}$$

or

$$p_e = 2,75\lambda C_H (0,22 + 0,15 \tan \alpha) (0,4V \sin \beta + 0,6 \sqrt{L})^2 \text{ kN/m}^2$$

or

$$= (0,28\lambda C_H (0,22 + 0,15 \tan \alpha) (0,4V \sin \beta + 0,6 \sqrt{L})^2 \text{ tonne-f/m}^2)$$

whichever is the greater.

(b) For inner doors:

$$\begin{aligned} p_e &= 0,45L \text{ kN/m}^2 \\ &= (0,046L \text{ tonne-f/m}^2) \end{aligned}$$

or

$$\begin{aligned} p_e &= 10q \text{ kN/m}^2 \\ &= (1,02q \text{ tonne-f/m}^2) \end{aligned}$$

whichever is the greater

The symbols are as defined in Pt 4, Ch 2, 8.1 Symbols.

8.6.2 The inner door internal design pressure, considered for the scantlings of securing devices, is not to be less than 25 kN/m² (2,5 tonne-f/m²).

8.6.3 For visor doors, the pivot arrangement is to be such that the visor is self-closing under external loads. The closing moment, M_c , is to be taken as:

$$M_c = P_x a + 10Wc - P_z b \text{ kN m}$$

$$(P_x a + 1,02Wc - P_z b \text{ tonne - fm})$$

but is not to be less than:

$$M_c = 10Wc + 0,1\sqrt{(a^2 + b^2)(P_x^2 + P_z^2)} \text{ kN m}$$

$$(1,02Wc + 0,1\sqrt{(a^2 + b^2)(P_x^2 + P_z^2)} \text{ tonne - fm})$$

8.6.4 For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reaction force required to prevent opening of the door within the permissible stresses given in Pt 4, Ch 2, 8.6 Design of securing and supporting devices. The opening moment M_o , to be balanced by this reaction force, is to be taken as not less than:

$$M_o = 10Wd + 5A_x a \text{ kN m}$$

$$(1,02Wd + 0,15A_x a \text{ tonne - fm})$$

8.6.5 For visor type doors, the securing and supporting devices, excluding hinges, are to be capable of resisting the vertical design force $(P_z - 10W)$ kN $((P_z - 1,02W)$ tonne-f), within the permissible stresses given in Pt 4, Ch 2, 8.6 Design of securing and supporting devices.

8.6.6 For side-opening doors, securing devices are to be provided such that in the event of a failure of any single securing device the remainder are capable of providing the full reaction force required to prevent the opening of the door. The permissible stresses given in Pt 4, Ch 2, 8.6 Design of securing and supporting devices are not to be exceeded. The opening moment about the hinges to be balanced by this reaction force is not to be less than that calculated when the following loads are applied:

- (a) An internal pressure of 5 kN/m² (0,51 tonne-f/m²).
- (b) A force of 10W kN (1,02W tonne-f) acting forward at the centroid of mass.

8.6.7 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

$$\tau = \frac{80}{k} \text{ N/mm}^2 \left(\frac{8,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2 \left(\frac{12,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2 \left(\frac{15,3}{k} \text{ kgf/mm}^2 \right)$$

8.6.8 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k} \text{ N/mm}^2 \left(\frac{12,7}{k} \text{ kgf/mm}^2 \right)$$

8.6.9 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure is not to exceed $0,8\sigma_y$. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The nominal bearing pressure is to be calculated by dividing the design force by the projected bearing area.

8.6.10 The reaction forces to be applied to the effective securing and supporting devices are to be determined from the combination of external loads defined in Table 2.8.1 Combination of external loads.

Table 2.8.1: Combination of external loads

Bow door type	Combination of external loads	
	Case 1 (Head seas)	Case 2 (Quartering seas)
Visor doors, see Notes 1 and 2	P_x and P_z see Note 3	$0,7P_y$ acting on each side separately, together with $0,7P_x$ and $0,7P_z$
Side opening, see Notes 1 and 2	P_x , P_y and P_z acting on both doors, see Note 3	$0,7P_x$ and $0,7P_z$ acting on both doors and $0,7P_y$ acting on each door separately
<p>Note 1. P_x, P_y and P_z are defined in Pt 4, Ch 2, 8.6 Design of securing and supporting devices. These forces are to be applied at the centroid of the projected areas.</p> <p>Note 2. The self-weight of the door is to be included in the combination of external loads.</p> <p>Note 3. The Case 1 forces are generally to give rise to a zero moment about the transverse axis through the centroid of area A_x, see Figure 2.8.1 Bow door (upward hinging).</p>		

8.6.11 The distribution of the reaction forces acting on the securing and supporting devices is to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not to be included in these calculations.

8.6.12 The hinge or linking arms of a bow door and its supports are to be designed for the static and dynamic opening forces. A minimum wind pressure of $1,5 \text{ kN/m}^2$ ($0,153 \text{ tonne-f/m}^2$), acting on the transverse projected area of the door is to be taken into account.

8.6.13 For side-opening doors, supporting devices are to be provided in way of girder ends at the closing of the two doors to prevent one side shifting towards the other under the effect of asymmetrical pressure. A typical arrangement is shown in Figure 2.8.3 Typical supporting device between doors.

8.6.14 Inner doors are to be gasketed and weathertight.

Figure 2.8.3: Typical supporting device between doors

8.6.15 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices.

8.6.16 The number of securing and supporting devices is to be the minimum practicable whilst complying with Pt 4, Ch 2, 8.6 Design of securing and supporting devices and Pt 4, Ch 2, 8.6 Design of securing and supporting devices and taking account of the available space for adequate support in the hull structure.

8.6.17 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, resulting from the external loads defined in Table 2.8.1 Combination of external loads, without exceeding, by more than 20 per cent, the permissible stresses as defined in Pt 4, Ch 2, 8.6 Design of securing and supporting devices.

8.7 Operating and Maintenance Manual

8.7.1 An Operating and Maintenance Manual for the bow doors and inner doors is to be provided on board and is to contain the following information:

(a) main particulars and design drawings,

- special safety precautions;
- details of vessel;
- equipment and design loading for ramps;
- key plan of equipment for doors and ramps;
- manufacturers' recommended testing for equipment; and
- a description of the equipment for:

bow doors;

inner bow doors;

bow ramp/doors;

side doors;

stern doors;

central power pack;

bridge panel;

ramps leading down from the main deck;

engine control room panel.

(b) service conditions:

- limiting heel and trim of the ship for loading/unloading;
- limiting heel and trim for door operations;
- operating instructions for doors and ramps; and
- emergency operating instructions for doors and ramps.

(c) maintenance:

- schedule and extent of maintenance;
- troubleshooting and acceptable clearances; and
- manufacturers' maintenance procedures.

(d) register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

This Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.

8.7.2 Documented operating procedures for closing and securing the bow doors and inner doors are to be kept on board and posted at an appropriate place.

Section 9

Subdivision structure on vehicle deck

9.1 General

9.1.1 The requirements of this Section cover subdivision structure fitted on the vehicle deck(s) of roll on-roll off passenger ships. Subdivision structure includes partition doors, bulkheads and longitudinal casings.

9.1.2 Where a ship is provided with subdivision structure that complies with the requirements of this Section, the ship will be eligible to be assigned the descriptive note **SSDS** which will be entered in column 6 of the *Register Book*.

9.1.3 The fitting of subdivision structure on the vehicle deck(s) forms one option to mitigate the stability-reducing effects of water on the vehicle deck(s) after damage. Such measures may be required by the National Administration with whom the ship is registered and/or by the National Administration within whose territorial jurisdiction the ship is intended to operate, for example see The Stockholm Agreement.

9.2 Design loads

9.2.1 For calculation of the design loads, an equivalent depth of water on the first vehicle deck above the design waterline, d , in metres, is to be derived in accordance with the requirements of the National Administration, see Pt 4, Ch 2, 9.1 General

9.2.2 It is assumed that vehicles and cargo are effectively lashed and secured to prevent movement from the stowed position.

9.2.3 The design heads (see Figure 2.9.1 Design heads for different locations in compartment) are not to be taken less than the greater of 0,5 m and:

(a) For transverse structure more than 1,5 m away from the longitudinal boundaries of the compartment:

$$h_T = 1,4\sqrt{L_c d K} \text{ in metres, for } z < 1$$

$$= 1,4\sqrt{L_c d K} \left(1 - \frac{(z-1)}{1,4\sqrt{L_c d K} - 1} \right) \text{ in metres, for } z \geq 1$$

Symbols are as defined in Pt 4, Ch 2, 9.2 Design loads.

(b) For longitudinal structure more than $L \sqrt{6}$ away from the transverse boundaries of the compartment:

$$h_L = \sqrt{B_c d} \text{ in metres, for } z < 1$$

$$= \sqrt{B_c d} \left(1 - \frac{(z-1)}{(1,4\sqrt{B_c d} - 1)} \right) \text{ in metres, for } z \geq 1$$

Symbols are as defined in Pt 4, Ch 2, 9.2 Design loads.

(c) For structure elsewhere:

$$h_c = \frac{L_c K}{2} + \sqrt{R} \text{ in metres, for } z < 1$$

$$= \left(\frac{L_c K}{2} + \sqrt{R} \right) \left(1 - \frac{(z-1)}{1,4 \left(\frac{L_c K}{2} + R \right) - 1} \right) \text{ in metres, for } z \geq 1$$

Symbols are as defined in Pt 4, Ch 2, 9.2 Design loads.

Figure 2.9.1: Design heads for different locations in compartment

9.2.4 Symbols, as used in Pt 4, Ch 2, 9.2 Design loads, are defined as follows:

d = equivalent depth of water on the vehicle deck, in metres, in the upright condition taking into account the volume of flooded and accumulated water on the vehicle deck calculated in accordance with the requirements of the National Administration, see Pt 4, Ch 2, 9.1 General and Pt 4, Ch 2, 9.2 Design loads

z = vertical distance, between the point under consideration and the flooded vehicle deck, in metres. For plate panels the point under consideration is to be taken as one third of the panel height above its lower edge. For stiffeners the point under consideration is to be taken as the midspan of the effective length

B_c = breadth of compartment, in metres, see Figure 2.9.1 Design heads for different locations in compartment

$K = 0,21 e^{(-0,0033L_{pp})}$ and need not exceed 0,14

L_c = length of compartment, in metres, see Figure 2.9.1 Design heads for different locations in compartment

$R = B_c d - \frac{L_c^2 K^2}{12}$ and is not to be taken less than 0

e = base of natural logarithms, 2,7183

L_{pp} = as defined in Pt 3, Ch 1, 6 Definitions

9.2.5 The design heads calculated in Pt 4, Ch 2, 9.2 Design loads are based on the ship being in the upright condition. Where the actual damaged floating position is specified, the design heads will be specially considered taking this into account.

9.2.6 The subdivision structure, and access doors within the subdivision structure, are to be capable of withstanding the design loading applied from the side of the compartment under consideration.

9.2.7 Consideration will be given to the use of design heads agreed by the National Administration.

9.3 Height of subdivision structure

9.3.1 The height of the subdivision structure, H_D , is not to be less than:

- 4m, or
- $8d$, but not less than 2,2 m, or

- the height between the vehicle deck under consideration and the underside of the next watertight deck above, whichever is the lesser.

where

d = is defined in Pt 4, Ch 2, 9.2 Design loads.

9.3.2 For special arrangements, such as hanging car decks or wide side casings, other subdivision structure heights may be accepted on the basis of detailed model tests in the flooded conditions under investigation by the National Administration.

9.4 Material

9.4.1 Where materials other than steel are used, the scantlings are to be specially considered.

9.5 Scantlings of subdivision structure other than doors

9.5.1 The minimum scantlings of subdivision bulkheads and casings are to be derived in accordance with Table 1.9.1 Watertight and deep tank bulkhead scantlings for watertight bulkheads, where h_4 is to be substituted by either of h_T , h_L or h_C , depending on the location under consideration.

9.5.2 Where a cut-out is made in the subdivision structure for the fitting of an access door, the strength and integrity of the subdivision structure are to be maintained.

9.6 Scantlings of subdivision doors

9.6.1 The plate thickness of subdivision doors of single plate construction is not to be less than the greater of:

$$t = 0,004s f(h k)^{0,5} \text{ mm, or}$$

$$t = 5,0 \text{ mm}$$

where

s, k = as defined in Pt 4, Ch 2, 1.5 Symbols

f = as defined in Table 1.9.1 Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships

h = h_T , h_L or h_C as defined in Pt 4, Ch 2, 9.2 Design loads, as appropriate.

9.6.2 For subdivision doors of a double plate construction the plate thickness is to be specially considered.

9.6.3 The scantlings of primary and secondary stiffeners of subdivision doors are to be based on direct strength calculations.

9.6.4 The direct strength calculations are also to provide an assessment of the door, under the design load, to enable the leakage and hence the drainage requirements of Pt 4, Ch 2, 9.9 Watertightness and drainage to be assessed.

9.6.5 For the purpose of the direct strength calculations. the stresses induced in the subdivision door, determined using the design loads from Pt 4, Ch 2, 9.2 Design loads, are not to exceed the permissible values given in Table 2.9.1 Permissible stress values. Checks are also to be carried out to ensure that the door will not buckle under the design loads.

Table 2.9.1: Permissible stress values

Stress type	Permissible stress
Direct stress	σ_o
Shear stress	$\frac{\sigma_o}{3}$
Combined stress	σ_o
Symbols	
σ_o = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

9.6.6 Where a cut-out is made within the subdivision door for the fitting of an access door, the strength of the subdivision door is to be maintained.

9.7 Closing, securing and supporting of subdivision doors

9.7.1 The closing and securing devices of doors are to comply with the following requirements:

- (a) Securing devices are to be simple to operate and easily accessible. They are to be of a design approved by LR for the intended purpose.
- (b) Securing devices and supporting devices are to be designed to withstand the design loads calculated in Pt 4, Ch 2, 9.2 Design loads in association with the permissible stresses shown in Table 2.9.2 Permissible stress values.
- (c) The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tensile stress in way of threads of bolts not carrying support forces is not to exceed $0,5\sigma_o$.
- (d) For steel to steel bearings in securing and supporting devices, the bearing pressure is not to exceed $0,8\sigma_o$. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The bearing pressure is to be calculated by dividing the design force by the projected bearing area.
- (e) Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included when calculating the reaction forces acting on the devices.
- (f) Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the securing devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.
- (g) Hydraulic systems are to comply with Pt 5, Ch 14, 14 Hydraulic systems.
- (h) Control and monitoring arrangements are to comply with Pt 6, Ch 2, 19 Ship safety systems.

Table 2.9.2: Permissible stress values

Stress type	Permissible stress
Direct stress	$0,8\sigma_o$
Shear stress	$0,5\sigma_o$
Combined stress	$0,8\sigma_o$
Symbols	
σ_o = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

9.7.2 The reaction forces to be applied to the effective securing and supporting devices are to be determined using the applicable design loads calculated using the heads in Pt 4, Ch 2, 9.2 Design loads together with the weight of the door.

9.8 Access doors

- 9.8.1 Access doors are permitted to be fitted in subdivision doors or bulkheads in order to provide access between compartments.
- 9.8.2 Access doors may be manually operated.
- 9.8.3 The strength of access doors is to be not less than that of the surrounding structure.
- 9.8.4 Means are to be provided to ensure that access doors are closed and secured when not in use after the ship has left the berth.
- 9.8.5 A notice is to be displayed on the access doors stating that the door is to be closed and secured at all times when not in use, when the ship is under way.
- 9.8.6 Means are to be provided on the navigation bridge to indicate whether the access doors are opened or closed.

9.9 Watertightness and drainage

- 9.9.1 Subdivision doors and access doors are to be fitted with gaskets in order to minimise leakage. For access doors where down flooding could result, particular attention is to be paid to drainage requirements.
- 9.9.2 The gasket arrangement shall provide sufficient flexibility to absorb possible racking deformation.

9.9.3 Attention is drawn to the drainage requirements of Pt 5, Ch 13, 3.1 General with respect to the compartments created by subdivision structures.

9.9.4 The drainage arrangement for each compartment is to have sufficient capacity to handle leakage from any adjacent flooded compartment.

9.10 Ventilation of vehicle deck spaces

9.10.1 Attention is drawn to the ventilation requirement of Pt 6, Ch 2, 14.13 Special requirements for ships with spaces for carrying vehicles with fuel in their tanks, for their own propulsion, since subdivision structure could disrupt air flow.

9.11 Operating and Maintenance Manual

9.11.1 An Operating and Maintenance Manual for the subdivision doors is to be provided on board and is to contain the following:

- main particulars and design drawings,
- service conditions (e.g. service area restrictions),
- maintenance and function testing,
- register of inspections, repairs and renewals.

9.11.2 The Manual is to be submitted for approval. It is to contain a note recommending that recorded inspections of supporting and securing devices are to be carried out by the ship's staff at monthly intervals, or following incidents that could result in damage, including heavy weather or contact in the region of the subdivision doors. Any damages recorded during such inspections are to be reported to LR.

9.11.3 Documented operating procedures for closing and securing the subdivision doors are to be kept on board and posted in an appropriate place.

■ *Section 10* **Masts and standing rigging**

10.1 General

10.1.1 Masts are generally to be of tubular construction and may be either stayed or unstayed. Special consideration will be given to other forms of construction.

10.1.2 Masts are to be of sufficient strength to withstand the worst combination of loads from both the operational case with full sail, reduced sail configurations where applicable and survival conditions.

10.1.3 Masts are to be adequately supported using stays if necessary.

10.1.4 Drainage is to be provided to prevent the build-up of sea-water or condensation within the mast structure. Steel masts should, where possible, be coated internally with a suitable anti-corrosive preparation.

10.1.5 Openings in the masts for entry and exit of running rigging or cables should be adequately compensated with suitable insert plates or doublers.

10.1.6 Masts are to be efficiently integrated into the hull and in principle, carried through to the keel. Alternative arrangements of supporting masts will require to be specially considered.

10.1.7 Where ship response data are not available the values for roll, pitch and heave given in Table 2.10.1 Ship motions should be used.

10.2 Design loadings and allowable stresses

10.2.1 The mast and standing rigging design is to be considered with respect to the loads from the following conditions:

- R1 - Operational case with full press of sails for the maximum operational apparent wind speed as specified by the designer.
- R2 - Storm conditions with reduced sail.
- R3 - Survival case with sails reefed/stowed/weathervaning with the environmental loads resulting from the combination of a maximum wind speed of 63 m/sec and the accelerations produced by ship motions.

Table 2.10.1: Ship motions

Motion	Maximum single amplitude	Period, in seconds
Roll	$\Phi = \sin^{-1}\theta$ degrees but need not exceed 30° and is not to be taken less than 22°	$T_r = \frac{0,7B}{\sqrt{GM}}$
Pitch	$\Psi = 12e^{-0,0033L_{pp}}$ degrees, but need not exceed 8°	$T_p = 0,5\sqrt{L_{pp}}$
Heave	$\frac{L_{pp}}{80}$ m	$T_h = 0,5\sqrt{L_{pp}}$
<p>where</p> <p>L_{pp}, B as defined in Pt 3, Ch 1, 6 Definitions</p> <p>GM = transverse metacentric height of loaded ship, in metres</p> <p>$\theta = \left(0,45 + 0,1\frac{L}{B}\right)\left(0,54 - \frac{L}{1270}\right)$</p>		

10.2.2 The mast section is to be designed to have a margin against failure due to column buckling using the greatest combined design axial and bending stress in both the transverse and fore and aft directions.

10.2.3 For loadcases R1 and R2 described in Pt 4, Ch 2, 10.2 Design loadings and allowable stresses, the following condition is to be satisfied:

$$\frac{\sigma_b}{\sigma_y} + \frac{\sigma_a}{\sigma_c} \leq 0,67$$

For loadcase R3 the following condition is to be satisfied:

$$\frac{\sigma_b}{\sigma_y} + \frac{\sigma_a}{\sigma_c} \leq 0,85$$

where

- σ_b = is the bending stress in the mast section under consideration
- σ_y = is the tensile yield stress for the material
- σ_a = is the axial stress in the mast section under consideration
- σ_c = is the critical buckling stress for the mast section.

10.2.4 For thin walled masts, constructed from either flat or curved shells, calculations are to be submitted demonstrating adequate margin against local elastic instability.

10.3 Materials of mast construction

10.3.1 In general masts are to be constructed from either steel or aluminium alloy tubular members, extrusions and/or welded constructions, and are, generally, to comply with LR's *Rules for the Manufacture, Testing and Certification of Materials*, where appropriate.

10.3.2 Other materials will be specially considered.

10.4 Standing rigging

10.4.1 Standing rigging is to be so arranged such that it does not foul running rigging or interfere with the operation of the sails. Protection is to be provided against routine quay contacts.

10.4.2 Standing rigging is to be effectively attached to the masts, deck and hull structure and is to be so designed that it cannot become disconnected during operation.

10.4.3 Standing rigging is to be properly erected using tensioning devices to ensure that the correct pre-tension is applied as specified by the designer.

10.4.4 The initial pre-tension applied to standing rigging is to be measured and recorded.

10.5 Design loadings

10.5.1 The forces in the standing rigging are to be obtained by direct calculation methods for the load conditions given in Pt 4, Ch 2, 10.2 Design loadings and allowable stresses.

10.5.2 The minimum factors of safety on the breaking strength of shrouds and stays are as follows:

Sail cases R1 and R2	3,5
Survival case R3	2,0

10.6 Shroud and stay attachment points

10.6.1 Standing rigging is to be effectively attached to the masts, ship's deck or bulwark structure. Chain plates, mast eyeplates and the structure in way are to be reinforced to withstand a load of 1,2 x breaking strength of the appropriate shroud or stay.

Generally the hull structure in way of shroud/stay attachment should be capable of withstanding the wire breaking load without permanent deformation of the structure.

10.6.2 Increased mast wall thickness, or internal or external mast stiffening rings or diaphragms are to be arranged in way of the toes of shroud and stay eyeplates to resist mast wall punching shear loads. Where additional mast stiffening rings or diaphragms are not fitted, the mast wall is not to be less than:

$$t_{\text{wall}} = \frac{2(h_{\text{eye}} B_s k_{\text{mast}})}{(t_{\text{eye}} l_{\text{eye}})} (\text{mm})$$

where

h_{eye} = eyeplate pin axis from mast wall, mm, see Figure 2.10.1 Definition of heye and leye

B_s = breaking strength, in kN, of attached rigging component

k_{mast} = mast material factor, k

t_{eye} = eyeplate thickness, mm, see Figure 2.10.1 Definition of heye and leye

l_{eye} = eyeplate length, mm, see Figure 2.10.1 Definition of heye and leye

10.6.3 The attachments of the stays and shrouds are to be efficiently integrated into the hull structure and due regard given to any attachments to the sheerstrake.

**Figure 2.10.1: Definition of h_{eye} and l_{eye}**

10.6.4 Where it is intended to use mechanical attachments (bolting) of running rigging or other gear to the mast walls, the number of holes are to be kept to a minimum and are to be staggered in order to maintain the structural integrity of the mast. All details are to be submitted.

10.7 Materials for rigging

10.7.1 In general, standing rigging is to be made from galvanised steel wire rope (GSRW) with galvanised steel rigging screws, shackles and terminations, and is to comply with the requirements of LR. Special consideration will, however, be given to other rigging materials.

10.7.2 Alternatively, stainless steel wire rope or solid rod rigging may be used in place of GSRW.

10.7.3 The steel wire rope, solid rods and loose fittings used for standing rigging are to be manufactured to a recognised National or International Standard and at an LR approved works.

10.7.4 Rigging components from other sources will be specially considered.

10.7.5 Where stainless steel rigging is employed, particular attention is to be given to the selection of the grade of material used as some stainless steels are prone to stress corrosion cracking and consequent fatigue failure, the onset of which is not readily observed.

10.7.6 Attention is drawn to the requirements of the Flag Administration for the vessel who may have requirements regarding the application of certain materials, systems or criteria.

10.8 Testing and certification

10.8.1 All equipment items used for standing rigging, including loose items of gear such as shackles, bottle screws, sheaves, etc. are to be tested and surveyed in accordance with LR requirements. For systems employing specialised devices or materials, individual consideration will be given to the testing and survey requirements.

10.8.2 For sailing passenger ships, the equipment requirement will be in accordance with the letter and numeral two grades higher than that corresponding to the calculated Equipment Numeral.

■ Section 11

Miscellaneous openings

11.1 General

11.1.1 The requirements of Pt 3, Ch 11, 6 Miscellaneous openings are to be complied with.

11.2 Openings in main vehicle deck

11.2.1 Where the main vehicle deck is enclosed, all companionways and openings in the deck which lead to spaces below are generally to be protected by steel doors or hatch covers. Approved fire doors may be accepted in lieu of steel doors. The sills or coamings are to be not less than 230 mm above the main vehicle deck, with the exception of those leading to machinery spaces which are to have sills or coamings not less than 380 mm. Exceptionally, when such openings are to be kept closed at sea, sills or coamings may be reduced in height, provided that the sealing arrangements are adequate. In such cases, the doors or hatch covers are to be secured weathertight by gaskets and a sufficient number of clamping devices. Such items as portable plates in the main vehicle deck arranged for the removal of machinery parts, etc. may be arranged flush with the deck, provided they are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.

11.2.2 Scuppers from vehicle or cargo spaces above the bulkhead deck fitted with an approved fixed pressure water spray fire-extinguishing system are to be led directly overboard and are to be fitted with means of preventing water from passing inboard in accordance with Pt 3, Ch 12, 4.2 Closing appliances.

11.2.3 Inboard draining scuppers do not require valves but are to be led to suitable drain tanks (not engine room or hold bilges) and the capacity of the tanks is to be sufficient to hold approximately 20 minutes of drenching water. The arrangements for emptying these tanks are to be approved and suitable high level alarms provided.

11.2.4 A drainage system is to be arranged in the area between bow door and ramp, or where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible and visual alarm function to the navigation bridge being set off when the water levels in these areas exceed 0,5 m or the high water level alarm, whichever is the lesser.

11.2.5 The drainage arrangement for each area is to have sufficient capacity to prevent accumulation of water in case of leakage. Scuppers are to be provided on both sides of the ship with a diameter not less than 50 mm and in accordance with Pt 3, Ch 12, 4 Scuppers and sanitary discharges. Alternatively, a bilge suction should be provided.

11.2.6 If the main vehicle deck is not totally enclosed, scuppers or freeing ports are to be provided consistent with the requirements of Pt 3, Ch 8, 5.3 Freeing arrangements.

11.2.7 Air pipes from cofferdams or void spaces may terminate in the enclosed 'tween deck space on the main vehicle deck provided the space is adequately ventilated and the air pipes are provided with weathertight closing appliances.

11.2.8 Between the bow door and the inner door a television surveillance system is to be fitted with a monitor on the navigation bridge and in the engine control room. The system must monitor the position of doors and a sufficient number of their securing devices. Special consideration is to be given for lighting and contrasting colour of objects under surveillance, see also Pt 4, Ch 2, 8.5 Arrangements for the closing, securing and supporting of doors.

11.3 Strength assessment of windows in large passenger ships

11.3.1 On windows in the second tier and higher above the freeboard deck, a glazing equivalent may be fitted in lieu of deadlights/storm covers. The thicknesses and arrangements are to be acceptable to the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate. For arrangements of glazing acceptable to LR, see Table 2.11.1 Acceptable arrangements of glazing in lieu of portable storm covers/deadlights. Alternative arrangement of glazing in lieu of deadlights/storm covers may be accepted provided details are submitted for consideration.

11.3.2 For passenger ships the design pressure, H_d , on windows is to be taken as given in Table 2.11.2 Design pressure, H_d , on windows, or an equivalent National or Internationally Recognised Standard.

11.3.3 The thickness, t_o , of toughened safety glass is to be taken as given in Table 2.11.3 Thickness of toughened glass.

11.3.4 Toughened safety glass of laminated construction will also be accepted, provided the requirements of Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights are complied with.

Table 2.11.1: Acceptable arrangements of glazing in lieu of portable storm covers/deadlights

In lieu of portable storm covers	In lieu of deadlights and storm covers
 $t_1^2 + (0,77t_2)^2 + t_1^2 = (1,2t_0)^2$	 $t_0^2 + t_0^2 = (1,4t_0)^2$  <p>35 mm gap</p>
Symbols	
t_0 = minimum thickness of toughened glass as calculated in Table 2.11.3 Thickness of toughened glass	

Table 2.11.2: Design pressure, H_d , on windows

Window location	Design pressure head H_d in metres
Between the design waterline and a point $Z_{1,5}$ m above the waterline	Per BS MA 25: 1973
Between a point $Z_{1,5}$ m above the waterline and the deck immediately above (at $Z_{d1,5}$)	1,5
Over the next 2 'tween deck heights	$1,5 - f_w \left(\frac{Z_w - Z_{d1,5}}{H_{t1} + H_{t2}} \right)$
For subsequent decks to the top of the navigation bridge	0,25 sides and aft ends 0,75 house fronts
From the top of the navigation bridge to the uppermost deck, for house fronts	0,75 at top of navigation bridge 0 at uppermost continuous deck, with linear variation between, but not less than 0,25
From the top of the navigation bridge to the uppermost deck, at sides and aft ends	0,25

Symbols
$f_w = 1,25$ in way of sides and ends of superstructures $= 0,75$ in way of house fronts
$Z_{1,5} =$ the vertical location in metres above the waterline at which the BS MA:25 pressure as given in Annex E of BS MA:25 (1973) is $1,5 \text{ t/m}^2$
$Z_{d1,5} =$ the vertical location in metres of the deck at which the pressure is $1,5 \text{ t/m}^2$ from Table 2.11.1 Acceptable arrangements of glazing in lieu of portable storm covers/deadlights
$Z_w =$ the vertical location in metres above the waterline to the point under consideration
$H_{t1} + H_{t2} =$ sum of the appropriate 'tween deck heights in metres

Table 2.11.3: Thickness of toughened glass

Window type	Thickness, t_o , in mm
Rectangular	$b\sqrt{\frac{H_d \beta}{4000}}$
Circular	$0,0175r\sqrt{H_d}$
Semi-circular	$0,011r\sqrt{H_d}$
Symbols	
$b =$ length of shorter side of window, in mm	
$H_d =$ design pressure head, in metres, as calculated in Table 2.11.2 Design pressure, H_d , on windows	
$\beta = 0,54A_R - 0,078A_R^2 - 0,17$ for $A_R \leq 3$ $= 0,75$ for $A_R > 3$	
$A_R =$ aspect ratio of window, in mm $= a/b$	
$a =$ length of longer side of window, in mm	
$r =$ the radius of the window, in mm	

11.4 Frame design and testing

11.4.1 **Application.** The testing requirements contained in this Section are for all exterior window and glass balustrade designs on all tiers for passenger ships regardless of length. The testing is to be carried out for characteristic window and balustrade sizes (largest, smallest) and forms (circular, semicircular and rectangular) for each passenger ship. Window and balustrade designs, which are not covered by Type Approval Certification, will require prototype testing in order to confirm structural integrity and weather or water tightness as required. Tests are to be carried out to the satisfaction of the Surveyor.

11.4.2 **Water tightness.** hydrostatic test is to be carried out in order to examine the water tightness of windows. This is carried out by applying the design pressure head H_d , as calculated in Pt 4, Ch 2, 11.3 Strength assessment of windows in large passenger ships, to the external face of the window and maintained at this level for at least 15 minutes.

11.4.3 **Structural testing.** A hydrostatic test is to be carried out in order to examine the capability of the frame, mullions and glass retaining arrangements. This is carried out by applying a test pressure of $4H_d$ (H_d as calculated in Pt 4, Ch 2, 11.3 Strength assessment of windows in large passenger ships for windows and Pt 4, Ch 2, 12.3 Weather design loads for balustrades) to the external face of the window. Alternatively this test may be carried out using a steel plate in place of the glass. Ideally, the steel plate should be of a suitable reduced thickness in order to simulate the flexural performance of the glass.

11.4.4 Equivalent proposals for testing will be considered. Where alternative testing procedures are proposed, these are to be agreed with LR before commencement.

11.4.5 **Chemically toughened glass.**

- (a) Chemically toughened glass may be used in lieu of thermally toughened glass provided it can be demonstrated the strength of the arrangement is at least equivalent in strength to that of thermally toughened glass.
- (b) The glazing system is to be of laminated construction.
- (c) Method of testing will be specially considered.

11.4.6 The overlap between glazing and the retaining frame is not to be less than 12 mm.

11.5 Strength of mullions

11.5.1 The section modulus of mullions is not to be less than:

$$Z = 10,78H_d l A_m k 10^{-9} \text{ cm}^3$$

where

a = see Table 2.11.4 Mullion arrangements

b = see Table 2.11.4 Mullion arrangements

r = see Table 2.11.4 Mullion arrangements

l = a for rectangular windows

= $2r$ for semi-circular windows

H_d = design pressure head, in metres, as calculated in Pt 4, Ch 2, 11.3 Strength assessment of windows in large passenger ships

A_m = ab for rectangular windows

= $1,22r^2$ for semi-circular windows

k = as defined in Pt 4, Ch 2, 1.5 Symbols.

Table 2.11.4: Mullion arrangements

Rectangular windows	Semi-circular windows
	
Symbols	
<p>a = dimension parallel to mullion, in mm</p> <p>b = length of shorter side of window, in mm</p> <p>r = radius of the window, in mm</p>	

11.6 Bonded windows and side scuttles

11.6.1 A 'bonded window' or 'bonded side scuttle' is one in which the glazing material is secured in its frame from outside of the ship by glue or other adhesive material. No mechanical fixing is provided for the glazing. Bonded windows and side scuttles are to comply with the requirements of Pt 4, Ch 2, 11 Miscellaneous openings. Proposals to secure glazing from the inside of the ship are to be specially considered using the requirements in this Section as a basis. It should be noted that bonding from the inside is not recommended and where it is proposed, further testing will be required. Non-load bearing secondary bonded glazing, e.g. glazing to improve thermal insulation, is not required to comply with the requirements of this sub- Section.

11.6.2 The adhesive is to be flexible enough to support the glazing without holding it firm. The glue strip is to be elastic, with width and thickness designed to allow the glazing to move in both directions in the plane of the glazing without undue forces on the bonding or the substrate. The glass is to be free to settle under-load and not to be forced to follow deflections in the supporting structure. If substantial racking of the glazing opening under-load is expected, the bonding is to be designed to accommodate such deflections.

11.6.3 Bonded windows and side scuttles may be considered as acceptable, in general, depending on their position, size of vessel and applicable statutory requirements, noting the distinction between glazing and the frame, which may have different requirements.

11.6.4 Bonded windows are not permitted in galley areas, including glazing in galley doors (internal or external). They are not permitted on escape routes and evacuation routes where a fire rating is required. The fire integrity of bulkheads is not to be impaired.

11.6.5 Bonded windows and side scuttles are not acceptable on fire-fighting vessels, i.e. those with a fire-fighting notation.

11.6.6 The failure of laminated glass is considered to pose a lower risk to safety than that of single pane glass. In the event of breaking, laminated glass more readily holds together and tends not to break up into large sharp pieces. Therefore, in general, laminated glazing is preferred. When laminated glass is used, the sealant is to be compatible with the interlayer. Lamination thickness is to be in accordance with Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights. Special consideration will be given to single pane toughened safety glass.

11.6.7 The durability of the adhesive and the sealant in the long term marine environment is to be considered in the approval process. Adhesive is to be approved in accordance with Ch 14, 2.15 Adhesive and sealant materials of the Rules for Materials. The adhesive bead is to be resistant to or protected from UV radiation, either by an optically dense area at the edges of the glazing or by overlapping trim or UV shielding tape. The adhesive bead is to be resistant to or protected from fungal attack. Arrangements are to be in accordance with the adhesive manufacturer's published guidelines and relevant LR Rules.

11.6.8 The edges of the bonding recess are to be rounded to facilitate the application of the sealant without air entrapment. The width of the gap between the flange and the glazing is to be large enough to accommodate the movement of the glazing as a result of hull deflection and thermal expansion, see Figure 2.11.1 Gap width between flange and window, bonded from outside of the ship. Recommended gap widths for bonded windows are to be taken as:

Gap width	Length of longest side of window
10–15 mm	<1,5 m
15–20 mm	1,5–3,0 m.

Figure 2.11.1: Gap width between flange and window, bonded from outside of the ship

11.6.9 The minimum adhesive width and thickness are to be in accordance with the adhesive manufacturer's published guidelines.

Section 12

External glass balustrades

12.1 General

12.1.1 Attention is drawn to relevant requirements of National and International Standards concerning the construction of barriers using glass, as well as applicable statutory regulations for the Protection of Crew, see the *International Convention on Load Lines, 1966* and its Protocol of 1988.

12.1.2 The requirements of this Section apply solely to external glass balustrades. External glass balustrades are barriers constructed with glass that are used on exposed decks.

12.2 Design considerations

12.2.1 External glass balustrades should not be situated in areas deemed essential for the operation of the ship. Such areas include mooring decks, lifeboat decks, external muster stations and in the vicinity of davits. Where external glass balustrades are not to be used, more traditional bulwarks or guard rails are to be fitted in accordance with Pt 3, Ch 8, 5 Bulwarks, guard rails and other means for the protection of crew.

12.2.2 External glass balustrades are to be designed to resist the most unfavourable anticipated loads within service, including weather loads or personnel loads without unacceptable deflection. Detailed plans and calculations are to be submitted clearly indicating the position, arrangement and the anticipated loads for all external glass balustrades.

12.2.3 External glass balustrades are to be not less than 1,0 m in height.

12.2.4 External glass balustrades are to provide water freeing areas in accordance with Pt 3, Ch 8, 5.3 Freeing arrangements.

12.2.5 Laminated toughened safety glass is to be used for the glazing of all external glass balustrades.

12.2.6 In general openings should not be greater than 76 mm unless required for water freeing. Openings for water freeing are not to be greater than 230 mm.

12.2.7 Consideration should be given to minimising the possibility of surface deterioration of the balustrade glass infill panels in service by means of suitable edge protection or finishes.

12.2.8 The total horizontal deflection of external glass balustrades is not to exceed 25 mm when subject to the anticipated loads specified in Pt 4, Ch 2, 12.3 Weather design loads or Pt 4, Ch 2, 12.4 Personnel design loads .

12.2.9 Special consideration may be given to external glass balustrades that are not constructed in accordance with this Section.

12.3 Weather design loads

12.3.1 External glass balustrades are to be designed to resist the anticipated weather loadings dependent on their location specified in Table 2.11.2 Design pressure, H_d , on windows . It is recommended that the equivalent monolithic thickness of the glass infill panels be derived through direct calculations using the design pressures given in Table 2.11.2 Design pressure, H_d , on windows and a safety factor of 2 on the characteristic failure strength of toughened safety glass. The equivalent laminated toughened safety glass thickness can then be obtained in accordance with Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights.

12.4 Personnel design loads

12.4.1 External glass balustrades are to be designed to resist the most unfavourable anticipated personnel loads, which are to be specified by the designer. The specified personnel loads are to be not less than 1,5 times the commensurate loads specified in *EN 1991-1-1:2002 Eurocode 1: Actions on structures – Part 1-1: General actions – Densities, self-weight, imposed loads for buildings*.

12.5 Balustrade stanchions

12.5.1 External glass balustrades are to be fitted with fixed stanchions of adequate strength to resist the anticipated loads imposed between stanchions specified in Pt 4, Ch 2, 12.3 Weather design loads and Pt 4, Ch 2, 12.4 Personnel design loads using a bending stress coefficient not greater than 0,6.

12.6 Balustrade top rail

12.6.1 External glass balustrades are to be fitted with a continuous top rail.

12.6.2 The top rail is to be sufficiently stiff so as not to permanently deflect when subject to the personnel loads specified in Pt 4, Ch 2, 12.4 Personnel design loads .

12.6.3 The top rail is to be sufficiently stiff so as not to deflect more than $L_b/96$ when subject to the personnel loads specified in Pt 4, Ch 2, 12.4 Personnel design loads .

where

$$L_b = \text{span of top rail between stanchions, in m.}$$

12.6.4 The top rail minimum section modulus is to be greater than:

$$Z = \frac{141 \times q_k \times L_b^2}{f_{\sigma} \sigma_o} \text{cm}^3$$

where

L_b = span of top rail between stanchions, in m.

q_k = line load on top rail, in kN/m, in accordance with Pt 4, Ch 2, 12.4 Personnel design loads and to be taken not less than 1 kN/m

σ_o = specified minimum yield stress in N/mm².

f_{σ} = bending stress coefficient not to be taken greater than 0,6.

12.7 Impact Resistance and Containment

12.7.1 External glass balustrades are to be subject to a prototype pendulum impact test in accordance with *EN 13049:2003 Windows — Soft and heavy body impact — Test method, safety requirements and classification* or an equivalent National or International Standard utilising a drop height of not less than 1,5m. The test specimens including the retaining arrangements should be the same as the finished installation.

■ **Section 13** **Direct calculation**

13.1 Application

13.1.1 Direct calculations are to be employed in derivation of scantlings where required by preceding Sections of this Chapter or by related provisions included in Pt 3 Ship Structures (General).

13.1.2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

13.2 Procedures

13.2.1 For details of LR's direct calculation procedures, see Pt 3, Ch 1, 2 Direct calculations. For requirements concerning use of other calculation procedures, see Pt 3, Ch 1, 3 Equivalents.

Section

- 1 **General**
- 2 **Longitudinal strength**
- 3 **Floors in single bottoms**
- 4 **Panting and strengthening of bottom forward**
- 5 **Machinery casings**
- 6 **Freeing arrangements**
- 7 **Towing arrangements**
- 8 **Fenders**
- 9 **Escort operation, performance numeral and trials**

■ Section 1 General

1.1 Application

1.1.1 Sections 1 to 8 of this Chapter apply to tugs.

1.1.2 Pt 4, Ch 3, 9 Escort operation, performance numeral and trials of this Chapter applies to tugs and offshore supply ships intended to provide escort operation.

1.1.3 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships except as otherwise specified. The draught, T , used for the determination of scantlings is to be not less than $0,85D$.

1.2 Class notations

1.2.1 Ships complying with relevant requirements will be assigned one or more of the class notations given in Table 3.1.1 Class notations.

1.2.2 Tugs intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) to Pt 1, Ch 2, 2.3 Class notations (hull), will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, tugs complying with the requirements of this Chapter and Pt 3, Ch 13, 7 Equipment for the relevant reduced equipment requirements, will be eligible to be classed:

- **A1 tug protected waters service;** or
- **A1 escort tug protected waters service;** or
- **A1 escort tug EPN (F,B,V,C) protected waters service;** see Pt 1, Ch 2, 2.3 Class notations (hull); or
- **100A1 tug with service restriction notation;** or
- **100A1 escort tug with service restriction notation;** or
- **100A1 escort tug EPN (F,B,V,C) with service restriction notation;**

whichever is applicable.

1.2.3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations to which reference should be made.

Table 3.1.1: Class notations

Class Notation	Applicable Sections
100A1 tug	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 8 Fenders
100A1 escort tug	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 9 Escort operation, performance numeral and trials, except Pt 4, Ch 3, 9.3 Performance numeral and trials
100A1 escort tug EPN (F, B, V, C)	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 9 Escort operation, performance numeral and trials
Note Tugs which comply with the anchor handler requirements in Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 4 Hull envelope framing and Pt 4, Ch 4, 10 Anchor handler will be eligible for the additional notation anchor handler .	

1.3 Information required

1.3.1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, plans covering the following items are to be submitted for approval where applicable:

- Support structure and foundations of towing equipment.
- Skegs, propeller guards and other structures which support the weight of the vessel during dry-docking.

1.3.2 The following supporting documents are to be submitted for information:

- Towing arrangements, including lines of action, magnitudes and corresponding points of application of towline pulls on towing equipment.
- Details of the breaking strength of the components of the towline system, together with maximum pull and brake holding load, or equivalent, of towing winches where applicable.

■ *Section 2* **Longitudinal strength**

2.1 General

2.1.1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength.

2.1.2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to tugs.

■ *Section 3* **Floors in single bottoms**

3.1 Floors

3.1.1 Single bottom floors are to be in accordance with the requirements of Pt 4, Ch 1, 7 Single bottom structure, except that floors clear of the machinery space may be flanged in lieu of a face plate being fitted.

■ *Section 4***Panting and strengthening of bottom forward****4.1 Panting region reinforcement**

4.1.1 The arrangements to resist panting required by Pt 3, Ch 5 Fore End Structure do not apply to tugs less than 46 m in length. In tugs 46 m or more in length, additional stiffening is also to be fitted in the 'tween decks throughout the panting region.

4.2 Strengthening of bottom forward

4.2.1 The requirements for strengthening of bottom forward detailed in Pt 3, Ch 5 Fore End Structure do not apply to tugs.

■ *Section 5***Machinery casings****5.1 Escape hatches**

5.1.1 Any emergency exit from the machinery room to the deck is to be capable of being used at extreme angles of heel, and should be positioned as high as possible above the waterline and on or near the ship's centreline. Covers to escape hatches are to have hinges arranged athwartships. Coaming heights are to be at least 600 mm above the upper surface of the deck.

■ *Section 6***Freeing arrangements****6.1 General**

6.1.1 If the only means of access to the wheelhouse is external, then stormboards, or an equivalent, are to be fitted between the deckhouse and the ship's sides forward of any deckhouse doors up to the height of the bulwark rail. A gap is to be left between the deck and the bottom board for freeing purposes.

■ *Section 7***Towing arrangements****7.1 Towing equipment**

7.1.1 For tugs which normally tow over the stern with the main towline connection to the hull ahead of the propellers, the position of towline connection is normally to be five to 10 per cent of the ship's length abaft amidships, but in no circumstances is it to be sited forward of a position, five per cent of the ship's Rule length abaft the longitudinal centre of gravity of the tug in any anticipated condition of loading.

7.1.2 The attachment of the towline to the tug is to be located as low as practicable in order to minimise heeling moments arising from working conditions. Reliable slip arrangements which facilitate towline release regardless of the angle of the towline are to be provided.

7.1.3 It is recommended that the slip arrangements should also be operable from the bridge. The arrangements should be tested to the Surveyor's satisfaction. The breaking strength of the hook, or its equivalent, should generally be 50 per cent in excess of that of the towline, see Pt 3, Ch 13, 7 Equipment.

7.2 Towing equipment foundations

7.2.1 Direct support for towing equipment by means of pillars and/or pillar bulkheads is to be arranged as far as this is practicable.

7.2.2 The design load for the support structure in way of towing equipment is to be not less than the breaking strength of the towline system. The design load is also to be taken as not less than the breaking strength of the tow hook or the brake holding load, or equivalent, of the winch, whichever is appropriate.

7.2.3 Scantlings of pillars and pillar bulkheads are to be in accordance with Pt 4, Ch 1, 4.4 Deck supporting structure.

7.2.4 Scantlings of deck girders and transverses forming the support structure of towing equipment are to be determined by direct calculations using the following stresses:

$$\begin{aligned}\tau &= \left(\frac{87}{k} \text{ N/mm}^2\right) & \left(\frac{8,9}{k} \text{ kgf/mm}^2\right) \\ \sigma &= \left(\frac{150}{k} \text{ N/mm}^2\right) & \left(\frac{15,3}{k} \text{ kgf/mm}^2\right) \\ \sigma_e &= \left(\frac{213}{k} \text{ N/mm}^2\right) & \left(\frac{21,7}{k} \text{ kgf/mm}^2\right)\end{aligned}$$

where

τ = shear stress, in N/mm²

σ = bending stress, in N/mm²

k = material factor, see Pt 3, Ch 2, 1.2 Steel

σ_e = equivalent stress, in N/mm²

$$= \sqrt{\sigma^2 + 3\tau^2}$$

7.2.5 Generally, the foundations of towing fairleads are to be carried through the deck and integrated into suitable underdeck structure.

7.2.6 On tugs which utilise an indirect method of towing, attention is drawn to the increased out-of-plane forces that occur in towing fairleads.

■ Section 8

Fenders

8.1 Ship's side fenders

8.1.1 An efficient fender is to be fitted to the ship's side at deck level extending all fore and aft.

■ Section 9

Escort operation, performance numeral and trials

9.1 General

9.1.1 An escort tug is a tug intended for escort operation. Escort operation is an operation in which the tug closely follows the assisted ship providing control by steering and braking, as necessary.

9.1.2 Escort tugs are to be capable of utilising methods of towing through which steering and braking forces are generated by a combination of propulsive and hydrodynamic forces developed by the tug, acting on the towline to the attended ship, see example in Figure 3.9.1 Forces generated during a typical escort mode.

9.1.3 The intact stability of the tug during escort operation is to comply with a Standard recognised by the National Administration with whom the ship is registered and/or by the National Administration within whose territorial jurisdiction the tug is intended to operate, as applicable. Attention is drawn to the inherent problems relating to the quick release of the towline and the sudden loss of propulsion power during the escort operation in addition to the maximum steering and braking forces.

9.2 Towing arrangements

9.2.1 The specified breaking strength of the towline is to be at least 2,5 x maximum design towline force.

9.2.2 The towing winch is to include a system of continuous load monitoring, with a bridge readout display and an overload prevention system, which is to be operational during escort duties. The overload prevention system is to be designed with the capability to pay out the towline in a controlled manner when the load reaches the maximum design towline force, and is to be capable of alerting the Master and crew.

9.3 Performance numeral and trials

9.3.1 Escort tugs which carry out full scale performance trials in accordance with the requirements of this Section will be eligible to have the escort performance numeral **EPN (F,B,V,C)** appended to the **escort tug** notations, see Pt 4, Ch 3, 1.2 Class notations and Pt 4, Ch 3, 1.2 Class notations and Pt 4, Ch 4, 1.2 Class notations,

where

- F** is the maximum steering force (F_s), in tonnes, see Figure 3.9.1 Forces generated during a typical escort mode and Pt 4, Ch 3, 9.3 Performance numeral and trials.
- B** is the maximum braking force (F_b), in tonnes, see Figure 3.9.1 Forces generated during a typical escort mode and Pt 4, Ch 3, 9.3 Performance numeral and trials.
- V** is the speed, in knots, at which **F** and **B** are determined.
- C** is the time, in seconds (s), required for the escort tug in manoeuvring from maintained oblique position of tug giving maximum steering force F_s on one side of assisted vessel to mirror position on the other side, see Pt 4, Ch 3, 9.3 Performance numeral and trials. The towline angle, α , need not be taken less than 30°, see Figure 3.9.1 Forces generated during a typical escort mode.

9.3.2 The performance numeral may be determined with speed **V** equal to either 8 knots or 10 knots. If both sets of numerals are determined at the trials then the class notation will include them all.

9.3.3 A trials plan, which includes the estimated forces, is to be submitted and approved prior to trials being undertaken.

9.3.4 The trials of the escort tug are to be performed using a ship capable of maintaining almost constant heading and speed when subjected to the steering and braking forces from the escort tug.

9.3.5 The following trials are to be carried out in calm weather conditions and in the presence of a Lloyd's Register Surveyor:

- Steering and braking force capability test, see Pt 4, Ch 3, 9.3 Performance numeral and trials.
- Bollard pull test, see Pt 4, Ch 3, 9.3 Performance numeral and trials.

A record of the results is to be kept on board the escort tug.

9.3.6 Prior to commencing a trial, the following data are to be recorded:

- Wind speed and direction.
- Sea state.
- Current speed and direction.
- Water depth.
- The main particulars and the loading condition of the assisted ship.
- Loading condition of the escort tug.

9.3.7 **Steering and braking force capability test** is a test by which the steering force, F_s , and braking force, F_b , are determined when utilising the method, shown in Figure 3.9.1 Forces generated during a typical escort mode, of towing at a range of towline angles, α , from 0 to 90 degrees and for a range of operating speeds up to and including the maximum escort speed. The following parameters are to be continuously recorded during the test:

- Position, speed and heading of the assisted ship and the escort tug.
- Towline force, F_t .
- Angle of towline, α .
- Heel angle of the escort tug.
- Direction of thrust and power absorbed by all propellers and thrusters of the tug.
- Rudder angles of the tug.

9.3.8 The length of the towline is to represent a typical operating condition and is to be recorded prior to and at the completion of the test. The steering and braking forces for a given speed and angle can be calculated by using the average values of the recorded towline force.

9.3.9 **Bollard pull test** is to be carried out in accordance with LR's *Bollard Pull Certification Procedures Guidance Information*.

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to sea-going ships specially designed and constructed for the carriage of specialised stores and cargoes to mobile offshore units and other offshore installations, and also to offshore tug/supply ships which in addition to the above perform the duties of a tug.

1.1.2 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships, except as otherwise specified in this Chapter.

1.1.3 Attention is drawn to the need for Masters to be able to assess the stability of their ships quickly and accurately in all service conditions, see Pt 1, Ch 2, 3 Surveys - General.

1.1.4 Where towing equipment is fitted, the requirements of Pt 4, Ch 3, 7 Towing arrangements are to be applied.

1.2 Class notations

1.2.1 In general, ships complying with the requirements of this Chapter and relevant additional requirements will be eligible for one or a combination of the notations indicated in Table 4.1.1 Class notations applicable to Offshore Supply Ships.

1.2.2 The following additional notations and annotations can be provided to give a further detailed description of features:

- **WDL(+)** (Weather deck load):

If the weather deck scantlings have been approved for a loading greater than a design head of 3,5 m, the notation **WDL(+)** may be added. If requested, the maximum permissible weather deck load and extent can be identified in the notation, e.g. **WDL(5,0 t/m2 from Aft to Fr. 26)**.

- **RD** (Relative density):

Where a ship has tanks appraised for a maximum permissible relative density greater than 1,025, the notation **RD(specified tank names, density)** may be added, see Pt 4, Ch 1 General Cargo Ships.

Offshore Support Vessels

Part 4, Chapter 4

Section 1

- **LFPL** (Low flashpoint liquids):

Ships intended for the carriage of liquids with flash point below 60°C (closed-cup test) in bulk are to be built and equipped in accordance with the relevant requirements of Pt 4, Ch 4, 8 Transport and handling of limited amounts of hazardous and noxious liquid substances in bulk and will be given the class notation **LFPL**. If requested, the concerned cargo, flash point (closed-cup test) and tank can be identified in the notation, e.g. **LFPL(methanol, 12°C, No. 7 centre tank)**.

1.2.3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations, to which reference should be made.

Table 4.1.1: Class notations applicable to Offshore Supply Ships

Class Notation	Requirements
100A1	Pt 1, Ch 2 Classification Regulations
Offshore supply ship	Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 7 Engine exhaust outlets
Supply ship	Pt 4, Ch 1 General Cargo Ships
Standby ship	Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 7 Engine exhaust outlets and Pt 4, Ch 4, 9 Standby ship
Anchor handler	Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 7 Engine exhaust outlets and Pt 4, Ch 4, 10 Anchor handler Pt 4, Ch 4, 5 Superstructures and deckhouses to Pt 4, Ch 4, 7 Engine exhaust outlets need not be applied if notation for Offshore supply ship is not applied
Tug	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 8 Fenders
Escort tug	Pt 4, Ch 3 Tugs, except Pt 4, Ch 3, 9.3 Performance numeral and trials
Escort tug EPN (F,B,V,C)	Pt 4, Ch 3 Tugs
AHTS	Pt 4, Ch 3, 1 General to Pt 4, Ch 3, 8 Fenders; and Pt 4, Ch 4, 1 General to Pt 4, Ch 4, 7 Engine exhaust outlets and Pt 4, Ch 4, 10 Anchor handler
Oil Recovery	Pt 7, Ch 5 Ships Equipped for Oil Recovery Operations
<p>Note 1. A ship designed to fulfil more than one function can be assigned a combination of the notations listed above, e.g.:</p> <ul style="list-style-type: none"> • 100A1 Offshore supply ship/Standby ship • 100A1 Offshore supply ship/Anchor handler • 100A1 Offshore supply ship/Standby ship/Oil Recovery • Any combination of the requirements listed in this Table. <p>Note 2. The notation Offshore Supply Ship will be assigned to ships that are designed to be operated on unrestricted worldwide service.</p> <p>Note 3. The notation Supply Ship will be assigned to ships that are designed for operation in specified restricted locations where the environmental conditions are less severe than for unrestricted worldwide service.</p>	

1.3 Information required

1.3.1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, plans covering the following items are to be submitted where applicable:

- Independent cargo tanks.
- Cargo tank foundations and securing arrangements.
- Towing arrangements, including supports and foundations of towing winches.
- Arrangements for the stowage of deck cargoes (cargo containment) and details of any associated racks or other similar structures and their supports/foundations together with information to indicate design loads.
- Movable decks, including the stowing arrangements for portable components.
- Freeing arrangements.

1.4 Symbols

1.4.1 The symbols are as defined in Pt 4, Ch 1, 1.5 Symbols and definitions.

■ *Section 2* **Longitudinal strength**

2.1 General

2.1.1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength.

2.1.2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are generally not applicable to offshore supply ships.

■ *Section 3* **Hull envelope plating**

3.1 Side shell

3.1.1 The thickness of side shell is to be that required by Pt 4, Ch 1, 5.4 Side shell but is not to be less than given by Table 4.3.1 Minimum side shell thickness

3.1.2 As an alternative, where over the length of a vessel, portions of the sheerstrake that are not protected by an efficient fender, the sheerstrake is to be increased by a minimum of 5 mm thickness. The increased thickness shall extend from the deck level to not less than 600 mm below the deck level.

Table 4.3.1: Minimum side shell thickness

Ship type	Minimum thickness, mm
Offshore supply ships	9
Standby ships	8
Anchor handler	9

3.2 Weather decks

3.2.1 Where cargo is to be carried on weather decks, the scantlings are to be suitable for the specified loadings. The thickness, t , of deck plating is to be not less than the greater of:

(a)

$$t = 0,025L + 4.5 + t_a \text{ mm}$$

(b)

$$t = 0,1f_m s \sqrt{\frac{PF_D}{f_y \sigma}} + t_a \text{ mm}$$

Where

P = specified design load for weather deck, in tonne/m²

$$= \frac{h}{1,39}$$

h = equivalent design head, in metres, not to be taken less than 3,5 m

s = spacing of secondary stiffeners, in mm

σ = yield stress of plating, in N/mm²

F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

f_m = 0,75

f_y = 0,67

t_a = 2,5 mm, in general

= 1,0 mm, for ships with dedicated class notation **Standby ship**.

3.2.2 Scantlings are to be increased locally where specialised cargoes are likely to induce concentrated loads that exceed the specified design load. Acceptable stress levels are given in Pt 4, Ch 3, 7.2 Towing equipment foundations.

3.3 Cargo containment

3.3.1 Means are to be provided to enable deck cargoes to be adequately secured and protected. In general, suitable inner bulwarks, rails, bins or storage racks of substantial construction are to be provided and properly secured to adequately strengthened parts of the hull structure. Properly designed locking equipment or efficient means of lashing containers are to be fitted where appropriate. Small hatches (including escape hatches), valve controls, ventilators, air pipes, etc. are to be situated clear of the cargo containment areas.

Section 4 Hull envelope framing

4.1 General

4.1.1 The section moduli of side longitudinals, the main and 'tween deck frames are to be not less than kZ , cm³ where

k = 1,25 in general

= 1,10 for ships with dedicated class notation **Standby ship**

Z = as required by Pt 4, Ch 1, 6 Shell envelope framing, Pt 3, Ch 5, 4 Shell envelope framing and Pt 3, Ch 6, 4 Shell envelope framing for the appropriate location.

4.1.2 Frames are not to be scalloped.

4.1.3 The scantlings of deck secondary stiffeners are to be in accordance with the requirements of Table 1.4.4 Cargo and accommodation deck longitudinals(1) or Table 1.4.5 Strength/weather, cargo and accommodation deck beams(2) in Pt 4, Ch 1 General Cargo Ships, where h_2 is to be taken as the specified design loading and not less than a design head of 3,5 m.

Section 5 Superstructures and deckhouses

5.1 Scantlings

5.1.1 The scantlings of deckhouses situated on the forecastle deck and above are to comply with the requirements of Table 4.5.1 Superstructures and deckhouses on forecastle deck.

Offshore Support Vessels

Part 4, Chapter 4

Section 6

5.1.2 The scantlings of forecastle end bulkheads are to be not less than those required by Table 4.5.1 Superstructures and deckhouses on forecastle deck for aft ends of deckhouses or less than those required by Pt 3, Ch 8, 2 Scantlings of erections other than forecastles for an exposed machinery casing.

Table 4.5.1: Superstructures and deckhouses on forecastle deck

Position	Thickness of plating, in mm	Modulus of stiffeners, in cm ³	Depth of stiffeners, in mm
Fronts	The greater of $t = 0,012s$ or 8,0	$Z = 0,034sl_e^2$	Not less than 100
Sides	The greater of $t = 0,01s$ or 6,5	$Z = 0,027sl_e^2$	Not less than 75
Aft ends	The greater of $t = 0,008s$ or 6,5	$Z = 0,027sl_e^2$	Not less than 65
Note The ends of stiffeners are to be connected on all tiers.			

Section 6

Miscellaneous openings

6.1 General

6.1.1 For offshore supply ships the requirements of Pt 3, Ch 11, 6 Miscellaneous openings are to be complied with.

6.2 Access from freeboard deck

6.2.1 There is to be no direct access from the freeboard deck to machinery or other spaces below the freeboard deck. Indirect access may be arranged via a space or passageway fitted with an outer door having a sill not less than 600 mm high and an inner door having a sill not less than 380 mm high. The inner door is to be self-closing and gastight. The space or passageway between the two doors is to be adequately drained. It is desirable, however, that access to spaces below the freeboard deck is arranged from a position above the superstructure deck. Where it is necessary to provide an emergency escape trunk which cannot terminate within a superstructure space, the arrangements for maintaining the integrity of the hatch or outlet are to be approved by Lloyd's Register (hereinafter referred to as 'LR').

6.3 Windows and side scuttles

6.3.1 The requirements of this Section are to be applied in conjunction with Pt 3, Ch 11, 6.5 Side scuttles, windows and skylights.

6.3.2 Windows may only be fitted in the following locations:

- (a) Second tier and higher above the freeboard deck:
 - (i) in the after end bulkhead of deckhouses and superstructures,
 - (ii) in the sides of deckhouses and superstructures which are not part of the shell plating.
- (b) Third tier and higher above the freeboard deck:
 - (i) in the forward facing bulkheads of deckhouse and superstructures, except that in the first tier of the front bulkhead above the weather deck, only side scuttles will be accepted.

6.3.3 In locations not specified in Pt 4, Ch 4, 6.3 Windows and side scuttles, only side scuttles will be accepted.

6.3.4 Permanently attached deadlights are to be provided as follows:

- (a) Side scuttles:
 - (i) in the side shell plating,
 - (ii) in the forward facing bulkheads of superstructures and deckhouses,
 - (iii) in the sides of deckhouses and superstructures up to and including the third tier above the freeboard deck,

- (iv) in the after end bulkheads of superstructures, deckhouses, casings and companionways in the first and second tiers above the freeboard deck.
- (b) Windows in locations permitted in Pt 4, Ch 4, 6.3 Windows and side scuttles:
 - (i) in the sides of deckhouses and superstructures in the second and third tiers above the freeboard deck.
 - (ii) in the after end bulkheads of superstructures, deckhouses, casings and companionways in the second tier above the freeboard deck.

6.3.5 On windows in the second tier and higher above the freeboard deck, hinged storm covers may be fitted in lieu of deadlights, provided there is safe access for closing.

6.3.6 Windows in the wheelhouse front are to have deadlights or storm covers. For storm covers, an arrangement for easy and safe access is to be provided, (e.g. gangway with railing). However, for practical purposes, the deadlights or storm covers may be portable if stowed adjacent to the window for quick fitting. At least two of the deadlights or storm covers are to have the means of providing a clear view.

6.3.7 Deadlights for side scuttles, and for windows not mentioned in Pt 4, Ch 4, 6.3 Windows and side scuttles and Pt 4, Ch 4, 6.3 Windows and side scuttles, are to be internally hinged.

6.3.8 Side scuttles are to comply with ISO Standard 1751, as follows:

- (a) Type A side scuttles in the shell plating, in the sides of superstructures and in the forward facing bulkheads of superstructures and deckhouses on the weather deck;
- (b) Type B side scuttles in the after ends of superstructures and in the sides and ends of deckhouses; or
- (c) An equivalent National Standard.

6.3.9 For the location of windows and side scuttles, see Figure 4.6.1 Location of windows and side scuttles.

6.3.10 The thickness of the toughened safety glass for windows is to be not less than the greater of:

(a)

$$t = 10 \text{ mm}$$

(b)

$$t = b \sqrt{\frac{H_d \beta}{4000}} \text{ mm}$$

where

H_d = design pressure head, in metres, as obtained from Table 4.6.1 Design pressure head, H_d , on windows

b = length of shorter side of window, in mm

$$\beta = 0,54A_R - 0,078A_R^2 - 0,17 \text{ for } A_R \leq 3$$

$$= 0,75 \text{ for } A_R > 3$$

A_R = aspect ratio of window

$$= a/b$$

a = length of longer side of window, in mm.

6.3.11 Proposals for alternative materials will be specially considered.

Table 4.6.1: Design pressure head, H_d , on windows

	Design pressure head, in metres	
	Windows in front and side bulkheads	Windows in after end bulkheads
6th tier and above	3,0	2,5
5th tier	5,0	2,5

Offshore Support Vessels

Part 4, Chapter 4

Section 7

4th tier	8,0	2,5
3rd tier	12,5	6,25
2nd tier	14,0	8,0

Section 7 Engine exhaust outlets

7.1 Location

7.1.1 Engine exhaust outlets are to be located as high as is practicable above the deck and are to be fitted with spark arresters.

■ Section 8

Transport and handling of limited amounts of hazardous and noxious liquid substances in bulk

8.1 General

8.1.1 The requirements of this Section are, in general, to be complied with unless they are waived or substituted by requirements mandated by the Administration.

8.1.2 This Section applies to the arrangement and scantling of sea-going ships as defined in Pt 4, Ch 4, 1.1 Application and intended for the carriage of:

- the aggregate quantity of bulk liquids identified in Pt 4, Ch 4, 8.1 General that is carried is any amount not exceeding a maximum which is the lesser of 800 m³ or a volume in cubic metres equal to 40 per cent of the vessel's deadweight calculated at a cargo density of 1,0.

8.1.3 Products which may be carried are:

(a) hazardous and noxious liquids listed in Table 4.8.1 Table of permitted cargoes and those other products which may be assigned to Table 4.8.1 Table of permitted cargoes based on the following criteria:

- products which for safety reasons may be assigned for carriage on a type 3 ship as defined by the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as Rules for Ships for Liquid Chemicals) and which are not required to meet the requirements for toxic products in Ch 15, 12 Toxic products of the Rules for Ships for Liquid Chemicals;
- noxious liquid substances which would be permitted for carriage on a type 3 ship;

(b) flammable liquids (liquids having a flashpoint not exceeding 60°C (closed-cup test)).

8.1.4 Carriage of products not listed in Table 4.8.1 Table of permitted cargoes should only be undertaken in accordance with suitable preliminary carriage conditions and the limitation referred to in Pt 4, Ch 4, 8.1 General.

8.1.5 Additives which are considered to fall outside the scope of products in Pt 4, Ch 4, 8.1 General may be carried in limited amounts. The aggregate amount of such additives which may be transported should not exceed 10 per cent of the vessel's maximum authorised quantity of products subject to this Section. An individual tank should contain not more than 10 m³ of these additives. The discharge of these additives into the sea from offshore support vessels is prohibited.

8.1.6 Ships complying with the requirements of this section will be eligible for the special feature notation **HNLS**.

Table 4.8.1: Table of permitted cargoes

Cargo	Flammability	Hazard
Oil-based mud containing mixtures of products listed in chapters 17 and 18 of the IBC Code and the MEPC.2/Circular and permitted to be carried under paragraph 8.1	No	–
Water-based mud containing mixtures of products listed in chapters 17 and 18 of the IBC Code and the MEPC.2/Circular and permitted to be carried under paragraph 8.1	No	–
Drilling Brines, including:	No	
Sodium Chloride Solution	No	P
Calcium Bromide Solution	No	P
Calcium Chloride Solution	No	P
Calcium nitrate/Magnesium nitrate/Potassium chloride solution	No	P
Calcium Nitrate Solution (50% or less)	No	P
Drilling brines (containing zinc salts)	No	P
Potassium Formate Solution	No	P

Offshore Support Vessels

Part 4, Chapter 4

Section 8

Noxious liquid, F, (8) n.o.s. (trade name, contains ...) ST3, Cat. Y	Yes	P
Noxious liquid, NF, (9) n.o.s. (trade name ..., contains ...) ST3, Cat. Z	No	P
Noxious liquid, F, (10) n.o.s. (trade name ..., contains ...) ST3, Cat. Z	Yes	P
Noxious liquid, (11) n.o.s. (trade name ..., contains ...) Cat. Z	No	P
Non-noxious liquid, (12) n.o.s. (trade name ..., contains ...) Cat. OS	No	P

8.2 Definitions

8.2.1 Cargo area is that part of the offshore supply ship where cargo and cargo vapours are likely to be present and includes cargo tanks, cargo pump-rooms, hold spaces in which independent tanks are located, cofferdams surrounding integral tanks and the following deck areas:

- within 3 m of a cargo tank installed on deck;
- within 3 m of a cargo tank outlet in case of independent tanks installed below deck;
- within 3 m of a cargo tank outlet in case of integral tanks installed below deck and separated from the weather deck by a cofferdam;
- the deck area above an integral tank without an overlaying cofferdam plus the deck area extending transversely and longitudinally for a distance of 3 m beyond each side of the tank;
- within 3 m of any cargo liquid or vapour pipe, flange, cargo valve, gas or vapour outlet, or entrance or ventilation opening to a cargo pump-room.

8.2.2 Deadweight means the difference in metric tons between the displacement of an offshore support vessel in water of a density of 1,025 at the load waterline corresponding to the assigned summer freeboard and the lightweight of the ship.

8.2.3 Lightweight means the displacement of an offshore support vessel in metric tons without cargo, fuel, lubricating oil, ballast water, fresh water and feed water in tanks, consumable stores, and passengers and crew and their effects.

8.2.4 Hazardous substance is any substance either listed in Ch 17 Summary of Minimum Requirements of the Rules for Ships for Liquid Chemicals or having a hazard more severe than one of the minimum hazard criteria given in criteria for hazard evaluation of bulk chemicals as approved by the Organisation.

8.2.5 Pollution hazard only substance means a substance having an entry only of "P" in column d in Ch 17 Summary of Minimum Requirements of the Rules for Ships for Liquid Chemicals.

8.2.6 Safety hazard substance means a substance having an entry of 'S' or 'S/P' in column d in Ch 17 Summary of Minimum Requirements of the Rules for Ships for Liquid Chemicals.

8.2.7 Flammable liquid is any liquid having a flashpoint not exceeding 60°C (closed-cup test).

8.3 Cargo tank location

8.3.1 Cargo tanks should be located at least 760 mm measured inboard from the side of the vessel perpendicular to the centreline at the level of the summer load waterline.

8.4 Cargo segregation

8.4.1 Tanks containing cargo or residues of cargo should be segregated from machinery spaces, propeller shaft tunnels, if fitted, dry cargo spaces, accommodation and service spaces and from drinking water and stores for human consumption, by means of a cofferdam, void space, cargo pump-room, empty tank, fuel oil tank, or other similar space. On-deck stowage of independent tanks or installing independent tanks in otherwise empty hold spaces should be considered as satisfying this requirement.

8.4.2 Cargoes which react in a hazardous manner with other cargoes or fuel oils should:

- be segregated from such other cargoes or fuel oils by means of a cofferdam, void space, cargo pump-room, empty tank, or tank containing a mutually compatible cargo;
- have separate pumping and piping systems which should not pass through other cargo tanks containing such cargoes, unless encased in a tunnel; and
- have separate tank venting systems.

8.4.3 Cargo piping should not pass through any accommodation, service or machinery space other than cargo pump-rooms or pump-rooms.

8.4.4 Pumps, ballast lines, vent lines and other similar equipment serving permanent ballast tanks should be independent of similar equipment serving cargo tanks.

8.4.5 Bilge pumping arrangements for cargo pump-rooms or for hold spaces in which independent cargo tanks are installed should be situated entirely within the cargo area.

8.5 Segregation requirements for integral tanks

8.5.1 Where not bounded by bottom shell plating, fuel oil tanks, a cargo pump-room or a pump-room, the cargo tanks should be surrounded by cofferdams. Tanks for other purposes (except fresh water and lubricating oils) may be accepted as cofferdams for these tanks.

8.5.2 For access to all spaces, the minimum spacing between cargo tank boundaries and adjacent ship's structures should be 600 mm.

8.5.3 Cargo tanks may extend to the deck plating, provided dry cargo is not handled in that area. Where dry cargo is handled on the deck area above a cargo tank, the cargo tank may not extend to the deck plating unless a continuous, permanent deck sheathing of wood or other suitable material of appropriate thickness and construction is fitted.

8.5.4 Cargoes subject to the scope of products in Pt 4, Ch 4, 8.1 General and Pt 4, Ch 4, 8.1 General should not be carried in either the fore or aft peak tanks.

8.5.5 For pollution hazard only substances having a flashpoint exceeding 60°C (closed-cup test) the arrangements referred to in Pt 4, Ch 4, 8.4 Cargo segregation and Pt 4, Ch 4, 8.4 Cargo segregation need not be applied provided that the segregation requirements for accommodation spaces, drinking water and stores for human consumption are satisfied. Additionally, Pt 4, Ch 4, 8.5 Segregation requirements for integral tanks and Pt 4, Ch 4, 8.5 Segregation requirements for integral tanks need not be applied.

8.6 Accommodation, service and machinery spaces and control stations

8.6.1 Accommodation or service spaces, or control stations should not be located within the cargo area.

8.6.2 Unless they are spaced at least 7 m away from the cargo area containing flammable products, entrances, air inlets and openings to accommodation, service and machinery spaces and control stations should not face the cargo area. Doors to spaces

not having access to accommodation, service and machinery spaces and control stations, such as cargo control stations and store-rooms, may be permitted within the 7 m zone specified above, provided the boundaries of the spaces are insulated to A-60 Standard and each case will be specially considered. When arranged within the 7 m zone specified above, windows and side scuttles facing the cargo area should be of a fixed type. Such side scuttles in the first tier on the maindeck should be fitted with inside covers of steel or equivalent material.

8.6.3 In order to guard against the danger of hazardous vapours, due consideration should be given to the location of air intakes and openings into accommodation, service and machinery spaces and control stations in relation to cargo piping and cargo vent systems.

8.6.4 For pollution hazard only substances having a flashpoint exceeding 60°C, the arrangements referred to in Pt 4, Ch 4, 8.6 Accommodation, service and machinery spaces and control stations to Pt 4, Ch 4, 8.6 Accommodation, service and machinery spaces and control stations may be waived.

8.7 Access to spaces in the cargo areas

8.7.1 Access to spaces within the cargo area should meet the requirements of Ch 3, 4 Access to spaces in the cargo area of the Rules for Ships for Liquid Chemicals.

8.8 Cargo tank construction

8.8.1 Cargo tanks are to be as required by the Rules and Regulations for the Construction and Classification for the Carriage of Liquid Gases in Bulk (hereinafter referred to as Rules for Ships for Liquefied Gases) or Rules for Ships for Liquid Chemicals as applicable and for the intended cargo.

8.8.2 Instead of the use of permanently attached decktanks, portable tanks meeting the requirements of the International Dangerous Goods (IMDG) Code or other portable tanks specially approved may be used for cargoes indicated in Pt 4, Ch 4, 8.1 General, provided that the tanks are properly located and secured to the vessel.

8.8.3 Except for the tank connections to cargo pump-rooms, all tank openings and connections to the tank should terminate above the weather deck and should be located in the tops of the tanks. Where cofferdams are provided over integral tanks, small trunks may be used to penetrate the cofferdam.

8.8.4 The greater of the following design pressures (gauge) should be used for determining scantlings of independent pressure tanks:

- 0,07 MPa;
- the vapour pressure of the cargo at 45°C;
- the vapour pressure of the cargo at 15°C above the temperature at which it is normally carried; or
- the pressure which occurs in the tank during the loading or unloading.

The design of the tanks should comply with acceptable standards taking into account the carriage temperature and relative density of cargo. Due consideration should also be given to dynamic forces and any vacuum pressure to which the tanks may be subjected.

8.8.5 Integral and independent gravity tanks should be constructed and tested according to acceptable standards taking into account the carriage temperature and relative density of cargo.

8.8.6 For pollution hazard only substances having a flashpoint exceeding 60°C, the requirements of Pt 4, Ch 4, 8.8 Cargo tank construction need not be applied.

8.9 Materials of construction

8.9.1 Materials of construction for tanks, piping, fittings and pumps should be in accordance with Ch 6 Materials of Construction and welding of the Rules for Ships for Liquid Chemicals, or Ch 6 Materials of Construction of the Rules for Ships for Liquefied Gases, as applicable.

8.10 Cargo tank vent systems

8.10.1 Independent pressure tanks should be fitted with pressure relief devices that are so designed as to direct the discharge away from personnel and that have a set pressure and capacity which is in accordance with acceptable standards taking into account the design pressure referred to in Pt 4, Ch 4, 8.8 Cargo tank construction.

8.10.2 Cargo tank vent systems of integral or independent gravity tanks should meet the requirements of the Rules for Ships for Liquid Chemicals, except that the height specified in Ch 8, 3 Types of tank venting systems of those Rules may be reduced to 2 m.

8.10.3 The location of cargo tank vent outlets for independent pressure tanks and for cargo tanks used to carry pollution hazard only substances with a flashpoint exceeding 60°C (closed-cup test) should be to the satisfaction of LR.

8.10.4 Cargo tank vent systems of portable tanks allowed under Pt 4, Ch 4, 8.8 Cargo tank construction should be to the satisfaction of LR, taking into account the requirements of 8.10.

8.11 Cargo transfer

8.11.1 The cargo transfer system should comply with the requirements of Ch 5 Cargo Transfer of the Rules for Ships for Liquid Chemicals, or the Ch 5 Process Pressure Vessels and Liquid, Vapour and Pressure Piping Systems, when considered applicable and practical, taking into account existing industry standards and practices.

8.11.2 The remote shutdown devices for all cargo pumps and similar equipment, required by Ch 5, 6 Cargo transfer control systems of the Rules for Ships for Liquid Chemicals, should be capable of being activated from a dedicated cargo control location which is manned at the time of cargo transfer and from at least one other location outside the cargo area and at a safe distance from it.

8.12 Electrical installations

8.12.1 Electrical installations should meet the requirements of Ch 10 Electrical Installations of the Rules for Ships for Liquid Chemicals.

8.13 Acid spill protection

8.13.1 Floors or decks under acid storage tanks and pumps and piping for acid should have a lining or coating of corrosion-resistant material extending up to a minimum height of 500 mm on the bounding bulkheads or coamings. Hatches or other openings in such floors or decks should be raised to a minimum height of 500 mm; however, where this height is not practicable a lesser height may be required.

8.13.2 Flanges or other detachable pipe connections should be covered by spray shields.

8.13.3 Portable shield covers for connecting the flanges of the loading manifold should be provided. Drip trays of corrosion-resistant material should be provided under loading manifolds for acids.

8.13.4 Spaces for acid storage tanks and acid pumping and piping should be provided with drainage arrangements of corrosion-resistant materials.

8.13.5 Deck spills should be kept away from accommodation and service areas by means of a permanent coaming of suitable height and extension.

8.14 Ventilation of spaces in the cargo area

8.14.1 The requirements of Ch 12 Mechanical Ventilation in the Cargo Area of the Rules for Ships for Liquid Chemicals are to be applied. Consideration will be given to requests for relaxation of requirements concerning the distance required in Ch 12, 1 Spaces normally entered during cargo-handling operations of the Rules for Ships for Liquid Chemicals.

8.15 Vapour detection

8.15.1 Vapour detection for the cargoes carried should be provided in accordance with the requirements contained in the Rules for Ships for Liquid Chemicals.

8.15.2 Enclosed and semi-enclosed spaces containing installations for acid should be fitted with fixed vapour detection and alarm systems which provide visual and audible indication. The vapour detection systems should be capable of detecting hydrogen except that, in the case where only hydrochloric acid is carried, a hydrogen chloride vapour detection system should be provided.

8.15.3 At least two portable instruments for detecting flammable vapour concentrations should be provided when cargoes subject to the requirements of this Section (see Pt 4, Ch 4, 8.1 General) with a flashpoint not exceeding 60°C (closed-cup test) are carried.

8.15.4 At least two portable instruments suitable for measuring the concentration of oxygen in atmospheric air should be provided.

8.16 Special requirements

8.16.1 The special requirements for the cargo as referred to in Ch 17 Summary of Minimum Requirements of the Rules for Ships for Liquid Chemicals or Ch 19 Summary of Minimum Requirements of the Rules for Ships for Liquefied Gases are applicable; however, the requirement in Ch 15, 19 Overflow control of the Rules for Ships for Liquid Chemicals for a visual and audible high-level alarm may be waived taking into account the cargo carriage arrangements and cargo loading procedures and each case will be specially considered.

8.17 Special requirements for the carriage of liquified gases

8.17.1 Each enclosed space used for handling or storage of a liquefied gas should be fitted with a sensor continuously monitoring the oxygen content of the space and an alarm indicating low oxygen concentration. For semi-enclosed spaces portable equipment may also be acceptable.

8.17.2 Drip trays resistant to cryogenic temperatures should be provided at manifolds transferring liquefied gases or at other flanged connections in the liquefied gas system.

8.17.3 For the carriage of liquid nitrogen the requirements of Ch 17, 19 Nitrogen of the Rules for Ships for Liquefied Gases are to be applied.

8.17.4 The construction of cargo tanks and cargo piping systems for liquefied nitrogen and liquid carbon dioxide should be to the satisfaction of LR.

8.17.5 Emergency shut-off valves should be provided in liquid outlet lines from each liquefied gas tank. The controls for the emergency shut-off valves should meet the requirements given in Pt 4, Ch 4, 8.10 Cargo tank vent systems for remote shutdown devices.

8.18 Gauging and level detection

8.18.1 Each cargo tank should have a level gauging system in accordance with the Rules for Ships for Liquefied Gases or Rules for Ships for Liquid Chemicals as applicable.

8.19 Emergency remote shutdown

8.19.1 In the case of transfer operations involving pressures in excess of 5 MPa, arrangements for emergency depressurising and disconnection of the transfer hose should be provided. The controls for activating emergency depressurisation and disconnection of the transfer hose should meet the requirements given in Pt 4, Ch 4, 8.11 Cargo transfer for remote shutdown devices.

8.20 Pollution requirements

8.20.1 Each ship certified to carry noxious liquid substances should be provided with a Cargo Record Book, a Procedure and Arrangements Manual and a Shipboard Marine Emergency Plan developed for the ship in accordance with Annex II to MARPOL 73/78 and approved.

8.20.2 Discharge into the sea of residues of noxious liquid substances permitted for the carriage in Ship Type 3, or products listed in Pt 4, Ch 4, 8.1 General or ballast water, tank washings, or other residues or mixtures containing such substances, is prohibited. Any discharges of residues and mixtures containing noxious liquid substances should be to reception facilities in port. As a consequence of this prohibition, the requirements for efficient stripping and underwater discharge arrangements in MARPOL 73/78, Annex II may be waived.

8.20.3 In the case of cargoes regulated by MARPOL 73/78, Annex I, the requirements of that Annex should apply as appropriate.

8.21 Decontamination showers and eyewashes

8.21.1 Except in the case of pollution hazard only substances, a suitably marked decontamination shower and eyewash should be available on deck in a convenient location. The shower and eyewash should be operable in all ambient conditions.

8.22 Protective and safety equipment

8.22.1 Protective and safety equipment should be kept on board in suitable locations as required by Ch 14 Personnel Protection of the Rules for Ships for Liquefied Gases or Ch 14 Personnel Protection of the Rules for Ships for Liquid Chemicals for products to be carried.

**■ Section 9
Standby ship****9.1 Application and definitions**

9.1.1 The requirements in this Section apply to standby ships. A standby ship is a sea-going ship designed, constructed, organised and maintained in such a way that she can give assistance in the event of an emergency on or near an offshore installation.

9.1.2 The National Authority with whom the ship is registered and/or the Administration within whose territorial jurisdiction the ship is intended to operate may have requirements for the same items as required by these Rules. In those instances the more onerous requirements are to be applied.

9.2 Configuration of standby ship

9.2.1 The main features of standby ships which dictate the structural configuration are:

- (a) Designated and illuminated winching area for helicopter operations.
- (b) Clearly marked and lighted rescue zone at the side of the ship.
- (c) Survivors area.
- (d) Fast rescue boat.

9.3 Information required

9.3.1 In addition to the information and plans required by Pt 4, Ch 4, 1.3 Information required, details of local strengthening of the following items are to be submitted where applicable:

- (a) The arrangement and integration into the hull of equipment, supports, foundations for rescue equipment, etc. in conjunction with their weight, working load and holding capability information.
- (b) Support for towing arrangement as applicable.
- (c) The arrangement for the fast rescue craft.

9.4 Equipment foundations

9.4.1 When considering the loads, all expected directions of operation are to be taken into account.

9.4.2 The foundation for towing equipment, if applicable, is to be in accordance with Pt 4, Ch 3, 7.2 Towing equipment foundations.

9.5 Ship Arrangement

9.5.1 For standby ships the rescue arrangement, accommodation and facilities for survivors and safety equipment is required to comply with a National Standard. The applicable Certificate or Statement of Compliance with a National Standard is to be issued by a National Administration, or by LR, or by an IACS member when so authorised. Where no national requirements exist for a particular vessel, LR will issue statement of compliance with UKOOA.

■ *Section 10* **Anchor handler**

10.1 Application and definitions

10.1.1 The requirements of this Section apply to ships specially designed, constructed and equipped for handling anchors of a floating offshore installation.

10.2 Structural configuration

10.2.1 The main features of an anchor handler which dictate the structural configurations are:

- (a) The ship has a completely clear after deck in order to handle the anchors effectively.
- (b) One or more winches designed for the purpose of deploying and recovering the anchors.
- (c) Large horizontal stern roller, if fitted. During the anchorhandling process the ship is often required to take the anchors on board by hauling them over her stern, along with their associated chain and other fittings. For this purpose a large horizontal roller is installed in the stern, usually at deck level.
- (d) A rounded form in way of the area for shipping/unshipping anchors at stern.
- (e) Chain lockers under the main winch, if fitted. Anchor handlers are sometimes required to store rig or mooring chain and, for this purpose, most are fitted with chain lockers under the main winch which double as ballast or brine tanks when not in use.
- (f) Equipment for temporary securing of the anchor e.g. shark's jaw.
- (g) Towing pins in way of the stern roller.
- (h) High duty bollards.

10.3 Information required

10.3.1 In addition to the information and plans required by Pt 4, Ch 4, 1.3 Information required, details of local strengthening of the following items are to be submitted where applicable:

- (a) The arrangement and integration into the hull of equipment, tanks, supports, foundations, etc. in conjunction with their weight, working load and holding capability information.
- (b) For unusual structural arrangement and equipment, calculations are to be submitted showing acceptable structural strength.
- (c) Supports and foundations for anchor handling and laying arrangements for anchors carried as cargo.

10.4 Hull envelope plating

10.4.1 Anchor handing activities often give rise to areas of high local loads and/or frequent impacts, such as in way of stern rollers and immediately adjacent to high duty bollards. The shell in way of high loads and/or frequent impacts is to be suitably reinforced by increasing shell plate thickness, additional stiffening support or other appropriate means.

10.5 Working deck

10.5.1 Deck areas, where there are arrangements for the collection and handling of anchors and associated equipment, are to be protected by wooden sheathing. Alternatively, this can be omitted if the plate thickness is increased by 2,5 mm.

10.6 Equipment foundations

10.6.1 When considering the loads, all expected directions of operation are to be taken into account. The foundation for deck equipment (winch, stern roller, etc.) is to be in accordance with Pt 4, Ch 3, 7.2 Towing equipment foundations as applicable.

Barges and Pontoons

- 2 **Longitudinal strength**
- 3 **Hull envelope plating**
- 4 **Hull envelope framing**
- 5 **Strengthening of bottom forward**
- 6 **Bottom strengthening for loading and unloading aground**
- 7 **Watertight bulkheads**
- 8 **Void spaces**

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies, in general, to manned or unmanned non-self-propelled ships defined as follows:

- (a) Barges for the carriage of general dry cargoes in cargo holds.
- (b) Barges for the carriage of liquid cargoes in bulk.
- (c) Pontoons designed specifically for the carriage of non-perishable cargo on deck.
- (d) Shipborne barges for the carriage of general dry cargo in cargo holds and intended to operate afloat only within specified geographical limits, and suitable for regular carriage on board a larger ship.

1.1.2 Manned or unmanned barges for the carriage of liquid chemicals in bulk and barges for the carriage of liquefied gases will receive individual consideration on the basis of the Rules, see Table 5.1.1 Applicable Rules.

Table 5.1.1: Applicable Rules

Type of barge	Applicable Rules
Barge for the carriage of general dry cargo in cargo hold	Pt 4, Ch 1 General Cargo Ships
Barge for the carriage of liquid cargo in bulk	Pt 4, Ch 10 Single Hull Oil Tankers
Pontoon designed specifically for the carriage of non-perishable cargo on deck	Pt 4, Ch 1 General Cargo Ships
Shipborne barges for the carriage of general dry cargo in cargo holds	Pt 4, Ch 1 General Cargo Ships and this Chapter for 'extended protected water service' barges
Barge for the carriage of liquid chemicals in bulk	<i>Rules for Ships for Liquid Chemicals in Bulk</i>
Barge for the carriage of liquefied gases	<i>Rules for Ships for Liquefied Gases</i>

1.1.3 The scantlings and arrangements, except where otherwise specified in this Chapter, are to comply with the Rules as indicated in Table 5.1.1 Applicable Rules.

1.1.4 The Rules assume that the structural arrangements of barges carrying cargo in holds will generally approximate to normal ship shape and construction. Barges of this type not doing so will receive individual consideration on the basis of the Rules.

1.1.5 The Rules also assume that barges and pontoons are homogeneously loaded. Barges or pontoons with other types of loading, e.g. crane pontoon, will receive individual consideration.

1.1.6 All barges and pontoons are to be fitted with adequate arrangements for towing. In general, such arrangements are to consist of, or be equivalent to, not less than two sets of bollards, each of which shall be suitable for accepting a towline of suitable breaking strength.

1.2 Class notations

1.2.1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:

- (a) **100A1 barge**. This class will be assigned to non-self-propelled sea-going ships as defined in Pt 4, Ch 5, 1.1 Application.
- (b) **100A1 oil barge**. This class will be assigned to non-self-propelled sea-going ships as defined in Pt 4, Ch 5, 1.1 Application.
- (c) **100A1 pontoon**. This class will be assigned to non-self-propelled sea-going ships as defined in Pt 4, Ch 5, 1.1 Application.

1.2.2 Barges and pontoons intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3 Class notations (hull) to Pt 1, Ch 2, 2.3 Class notations (hull), will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, shipborne barges as defined in Pt 4, Ch 5, 1.1 Application complying with the requirements of this Chapter will be eligible to be classed **100A1 shipborne barge extended protected water service**.

1.2.3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations, to which reference should be made.

1.3 Information required

1.3.1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, the following are to be submitted:

- Details of structure and fittings to which deck cargo securing lashings, etc. are attached.
- Details of the bollards and their supporting structure.
- Where pusher tugs or integral tug/barge systems are proposed, full details and data of the attachment and support arrangements.
- Details of the intended service areas required for barges or pontoons designed to operate within specified geographical limits.
- Longitudinal strength and lifting arrangements for ship-borne barges.

1.4 Symbols and definitions

1.4.1 The Rule length, L , for vessels with swim ends is to be measured as shown in Figure 5.1.1 Definition of Rule length. Where a swim end is arranged aft but no rudder is fitted, L need not exceed 97 per cent of the extreme length on the summer load waterline. For tugs and barge units having rigid connections, the length, L , is to be taken as the combined length of the tug and barge.

Figure 5.1.1: Definition of Rule length

Barges and Pontoons

Part 4, Chapter 5

Section 2

Section 2 Longitudinal strength

2.1 General

2.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 Longitudinal Strength, and the ship service factor, f_1 , is given in Table 5.2.1 Ship service factor f_1 .

Table 5.2.1: Ship service factor f_1

Type of ship	f_1	
	'100A1'	'100A1 extended protected water service'
Barge for the carriage of general cargo in holds and for the carriage of liquid cargoes in bulk Pontoons for the carriage of non-perishable cargoes on deck	1,0	0,80
Shipborne barges for the carriage of general cargo in holds and unmanned	—	0,70

2.1.2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to barges and pontoons.

2.1.3 For shipborne barges, where it is the intention to lift the barge on board ship by crane, a condition 'fully loaded barge suspended by crane' is to be submitted. For this condition the following stresses are permissible:

- Bending stress $\sigma_b = 147,2 \text{ N/mm}^2$ (15,0 kgf/mm²)
- Shear stress $\tau = 98,1 \text{ N/mm}^2$ (10,0 kgf/mm²)

Section 3 Hull envelope plating

3.1 Shell and deck plating

3.1.1 The thickness of shell and deck plating is to be as necessary to give the hull section modulus required by Pt 4, Ch 5, 2.1 General and to satisfy the requirements listed in Table 5.3.1 Shell and deck plating.

Table 5.3.1: Shell and deck plating

Item of plating	Thickness for ships classed 100A1	Thickness for ships having extended protected water service notation
(a) Keel	The separate requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable, for keel width and thickness need not be applied, except where $L > 100 \text{ m}$ and the bottom has a rise of floor	
(b) Bottom shell and bilge	In accordance with the requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable	In accordance with the requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable, reduced by 12,5 per cent, but is to be not less than required by (c) below
	For chines, see Pt 4, Ch 5, 3.1 Shell and deck plating	

Barges and Pontoons

Part 4, Chapter 5

Section 4

(c)	Side shell from upper turn of bilge or chine to deck	The greater of the values obtained from Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable, for the appropriate framing arrangement	
(d)	Deck	In accordance with the requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable	In accordance with the requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable, reduced by 2 mm, but is to be not less than the deck basic end thickness as required by Pt 3, Ch 5 Fore End Structure and Pt 3, Ch 6 Aft End Structure
		In pontoon barges with deck cargoes the deck thickness derived from (d) may be required to be increased	
(e)	Swim ends	The bottom shell plating thickness is to be maintained up to the summer load waterline for the rake plating. Above this point the thickness may be tapered to that of the side shell requirements from a point not less than 1 m above the load waterline	

3.1.2 On ships with two chines each side, the bilge plating should generally be calculated from the bottom plating formulae. On hard chine ships, flanged chines will not, in general, be approved, but where a chine is formed by knuckling the shell plating, the radius of curvature, measured on the inside of the plate, is to be not less than 10 times the plate thickness. Where a solid round chine bar is fitted, the bar diameter is to be not less than three times the thickness of the thickest abutting plate. Where welded chines are used, the welding is to be built up as necessary to ensure that the shell plating thickness is maintained across the weld.

Section 4 Hull envelope framing

4.1 Symbols

4.1.1 The symbols used in this Section are defined as follows:

h = head or load height, in metres, and is to be taken as:

= for bottom longitudinals, frames, girders and transverses: the depth D

= for side longitudinals: the distance of the longitudinal below the deck at side, but not less than $0,01L + 0,7$

= for side transverses: the distance from the mid-point of span to the deck at side, but not less than $0,01L + 0,7$

= for deck longitudinals and transverses: the head equivalent to cargo carried at a stowage rate of $1,39 \text{ m}^3/\text{tonne}$, but is not to be taken less than $0,01L + 0,7$

= for side frames: the distance from the midpoint of span to the deck at the side

= for deck beams and girders: the head equivalent to cargo carried at a stowage rate of $1,39 \text{ m}^3/\text{tonne}$, but is not to be taken less than required by Table 3.5.1 Design heads and permissible cargo loadings

l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3, 3 Structural idealisation

s = spacing of frames, beams or longitudinals, in mm

S = spacing or mean spacing of girders, transverses or floors, in metres

Z = section modulus of stiffening member, in cm^3 , see Pt 3, Ch 3, 3 Structural idealisation.

Barges and Pontoons

Part 4, Chapter 5

Section 4

4.2 General

4.2.1 Bottom, side and deck transverses are to be connected in such a manner as to ensure continuity of the transverse ring system, and longitudinals are to be attached to transverses. In way of deck and bottom transverses, a deep web frame is to be fitted.

4.2.2 End connections of longitudinals at bulkheads are to provide adequate fixity and direct continuity of longitudinal strength.

4.2.3 Brackets at the top and bottom of side frames are to extend to the adjacent deck or bottom longitudinal to which they are to be attached.

4.2.4 In pontoons where truss arrangements, comprising top and bottom girders in association with pillars and diagonal bracing, are used in the support of the deck loads, the diagonal members are generally to have angles of inclination with the horizontal of about 45° and cross-sectional area of approximately 50 per cent of the adjacent pillar in accordance with Pt 4, Ch 1, 4.4 Deck supporting structure, with a head in accordance with Pt 4, Ch 1, 4.1 General.

4.2.5 Adequate support must be provided on the centreline for the loads imposed on the structure when the ship is in dry dock.

4.3 Longitudinal framing

4.3.1 The scantlings of bottom, side and deck longitudinals are to comply with the requirements of Table 5.4.1 Longitudinal framing.

Table 5.4.1: Longitudinal framing

Position of longitudinals	Modulus, in cm ³
Bottom	* $Z = 11,0 l_e^2 sh \times 10^{-3}$
Side shell	* $Z = 8,0 l_e^2 sh \times 10^{-3}$
Deck	* $Z = 5,5 l_e^2 sh \times 10^{-3}$
* For the requirements for barges carrying liquid cargoes in bulk see Pt 4, Ch 10 Single Hull Oil Tankers	
Note The scantlings derived from above need not exceed the scantling requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable.	

4.4 Transverse framing

4.4.1 The scantlings of bottom and side frames and deck beams are to comply with the requirements of Table 5.4.2 Transverse framing.

Table 5.4.2: Transverse framing

Position of member	Modulus, in cm ³
Bottom and side frames	* $Z = 9,5 l_e^2 sh \times 10^{-3}$
Deck beams	* $Z = 4,5 l_e^2 sh \times 10^{-3}$
* For the requirements for barges carrying liquid cargoes in bulk see Pt 4, Ch 10 Single Hull Oil Tankers	
Note The scantlings derived from above need not exceed the scantling requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable.	

4.5 Primary supporting structure

4.5.1 Primary supporting members are to comply with the requirements of Table 5.4.3 Primary supporting structure.

Table 5.4.3: Primary supporting structure

Position of member	Modulus, in cm ³
Bottom transverse	$*Z = 11,0l_e^2 Sh$
Side transverse	$*Z = 8,0l_e^2 Sh$ (may be reduced by 5 per cent for vessels classed '100A1 extended protected water service')
Deck transverse	$*Z = 5,5l_e^2 Sh$
Bottom girder	$*Z = 9,5l_e^2 Sh$
Deck longitudinal girder	$*Z = 5,0l_e^2 Sh$
	* For the requirements for barges carrying liquid cargoes in bulk see Pt 4, Ch 10 Single Hull Oil Tankers
Note The scantlings derived from above need not exceed the scantling requirements of Pt 4, Ch 1 General Cargo Ships or Pt 4, Ch 10 Single Hull Oil Tankers, whichever is applicable	

■ Section 5

Strengthening of bottom forward

5.1 Application

5.1.1 The requirements for strengthening of bottom forward detailed in Pt 3, Ch 5 Fore End Structure do not apply to barges or pontoons less than 50 m in length.

■ Section 6

Bottom strengthening for loading and unloading aground

6.1 Application

6.1.1 For barges or pontoons intended to load or unload while aground, see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

■ Section 7

Watertight bulkheads

7.1 Collision bulkheads

7.1.1 Barges and pontoons are to have a collision bulkhead extending intact to the strength/weather deck and, in general, this is to be positioned as detailed in Table 5.7.1 Collision bulkhead position.

Barges and Pontoons

Part 4, Chapter 5

Section 8

Table 5.7.1: Collision bulkhead position

Length L , in metres	Distance of collision bulkhead aft of fore end of L , in metres, see Figure 5.1.1 Definition of Rule length	
	Minimum	Maximum
≤ 150	$0,05L$	$0,05L + 4,5$
> 150	The lesser of: $0,05L$ or 10	$0,08L$

■ Section 8

Void spaces

8.1 Void spaces on unmanned pontoons not fitted with auxiliary machinery

8.1.1 Drainage arrangements and air pipes are to be provided in accordance with Pt 5, Ch 13, 10 Drainage arrangements for ships not fitted with propelling machinery and Pt 5, Ch 13, 12.4 Air pipes respectively.

8.1.2 Deck openings to allow drainage in accordance with Pt 5, Ch 13, 10.1 Pumps are to be as small as practicable and closed by watertight gasketed covers of steel or equivalent material.

- 9 **Strengthening of bottom forward**

■ Section 1

General

1.1 Application

- 1.1.1 This Chapter applies to sea-going steel trawlers, stern trawlers and fishing vessels.
- 1.1.2 For the purpose of this Chapter, a fishing vessel is a ship used for fishing operations, but not equipped for trawling.
- 1.1.3 The scantlings and arrangements are to be as required by Pt 4, Ch 1 General Cargo Ships except as otherwise specified in this Chapter. Consideration will be given to proposals for modified scantlings on vessels where L is less than 24 m.

1.2 Assignment of load lines

- 1.2.1 The *International Convention on Load Lines, 1966* does not apply to trawlers and fishing vessels, but certain National Authorities may request the assignment of load lines for ships registered in their countries.
- 1.2.2 The Rules affecting the protection of openings and protection of crew, and particularly those contained in Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads and Pt 3, Ch 12 Ventilators, Air Pipes and Discharges, may be modified to take account of National Regulations or practicabilities related to fishing operations.

1.3 Class notations

- 1.3.1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:
- (a) **100A1 trawler**. This class will be assigned to side fishing trawlers.
 - (b) **100A1 stern trawler**. This class will be assigned to stern fishing trawlers.
 - (c) **100A1 fishing vessel**. This class will be assigned to fishing vessels, see Pt 4, Ch 6, 1.1 Application.
- 1.3.2 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations to which reference should be made.

1.4 Information required

- 1.4.1 In addition to the information required by Pt 3, Ch 1, 5 Information required, the position and arrangement of trawl gear and deck machinery and location of insulated compartments are to be indicated.

1.5 Symbols and definitions

1.5.1 The Rule length, L , is the distance, in metres, on the classification waterline from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post. L is to be not less than 96 per cent, and need not be greater than 97 per cent, of the extreme length on the classification waterline.

1.5.2 Breadth B , is the greatest moulded breadth, in metres.

1.5.3 Depth D , is measured, in metres, at the middle of the length, L from the base line to top of the deck beam at side on the uppermost continuous deck.

1.5.4 The classification waterline in single deck ships is the waterline taken perpendicular to the plane of the transverse bulkheads located at $0,85D$ from the base line amidships, or at the maximum operational draught amidships, whichever is the greater. In two-deck ships, it is the waterline located at the maximum operational draught, but if this is unknown, it may be taken at 50 mm below the lower deck. If a load line is required by a National Authority, the classification waterline is the summer load waterline.

1.5.5 Keel line is the line parallel to the slope of the keel intersecting the top of the keel at amidships, or the line of intersection of the inside of shell plating with the keel where a bar keel is fitted.

1.5.6 Base line is a line parallel to the classification waterline and intersecting the keel line at amidships.

1.5.7 Draught T , is the distance in metres, between the classification waterline and the base line amidships.

1.5.8 The block coefficient C_b is to be taken at the classification waterline.

1.5.9 The following symbols are also applicable to this Chapter:

k = material factor, see Pt 4, Ch 1, 1.5 Symbols and definitions

l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3, 3 Structural idealisation

s = spacing of stiffeners, in mm

$s_b = 470 + \frac{L}{0,6}$ with minimum limitation at ends as defined in Pt 3, Ch 5, Table 5.3.1 Shell plating forward for fore end structure and Pt 3, Ch 6 Aft End Structure, Table 6.3.1 Shell plating aft for aft end structure

$s_1 = s$, but not less than s_b

t = thickness of plating, in mm

Z = section modulus of stiffening member, in cm^3 , see Pt 3, Ch 3, 3 Structural idealisation

■ Section 2 Protection

2.1 Protection of steelwork

2.1.1 Where wood sheathing is fitted, the material is to be of good quality, well seasoned and free from sapwood, and the thickness is to be not less than 65 mm. The plank widths should not normally exceed 150 mm. Thwartship planks are to be laid at the ends of deckhouses and at break of deck. Fastenings are to be sunk below the surface of the planking and covered with turned dowels, and the whole to be thoroughly bedded in a suitable composition. All weather decks are to be caulked and payed.

2.1.2 Where gutter waterways are fitted, the bar forming the inner edge of the waterway is to be not less than 7,5 mm thick.

2.1.3 Welded studs are to be not less than 9,5 mm diameter, and are to be coated with suitable composition before the planking is laid. Bolts used instead of studs may be 12,5 mm diameter galvanised. If the steel deck is penetrated for bolts, the deck is to be hose tested in accordance with Pt 3, Ch 8 Superstructures, Deckhouses and Bulwarks.

2.2 Protection of cargo

2.2.1 When a fuel oil bunker or double bottom carrying fuel oil, or a lubricating oil tank, is adjacent to a fish hold, the relevant requirements of Pt 4, Ch 3, 4 Panting and strengthening of bottom forward are to be complied with.

2.2.2 Compartments used for the processing of fish, or for temporary storage during or while awaiting processing, need not comply with the requirements of Pt 4, Ch 6, 2.2 Protection of cargo, but the construction of the bulkheads, decks and insulation, if any, should be such as to minimise the risk of oil leakage.

■ *Section 3*
Longitudinal strength

3.1 General

3.1.1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4 Longitudinal Strength.

3.1.2 The requirements of Pt 3, Ch 4, 8.3 Loading instrument regarding loading instruments are not applicable to trawlers and fishing vessels.

■ *Section 4*
Deck structure

4.1 Deck plating

4.1.1 The thickness of deck plating is to be not less than that required by Pt 4, Ch 1, 4 Deck structure. Under the trawl winch, windlass, mast, centre and side bollards and galleys, the plating thickness is to be not less than:

$$t = (0,04L + 7,5) \text{ mm}$$

where L is to be taken not less than 30 m.

4.1.2 When a raised deck is fitted, adequate scarfing is to be arranged at the step.

4.2 Factory deck beams

4.2.1 The section modulus of the beams of factory decks under fish handling spaces is to be not less than that required by Table 1.4.5 Strength/weather, cargo and accommodation deck beams in Pt 4, Ch 1 General Cargo Ships, with h_2 equal to 2 m, but extra strengthening may be required in way of heavy items of machinery or equipment.

■ *Section 5*
Shell envelope plating

5.1 Shell plating

5.1.1 The thickness of shell plating is to be not less than that required by Pt 4, Ch 1, 5 Shell envelope plating but in no case is it to be less than the following:

$$\text{For } L \leq 70\text{m} \quad t = (5,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}} \text{ mm}$$

$$\text{For } L > 70\text{m} \quad t = (6,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}} \text{ mm}$$

Trawlers and Fishing Vessels

Part 4, Chapter 6

Section 6

-
- 5.1.2 For single deck side trawlers the thickness derived from the formulae in Pt 4, Ch 6, 5.1 Shell plating is to be increased by 10 per cent.
- 5.1.3 When nets or control wires are in contact with the ship's side, such as below the gallows in a side trawler, the side shell plating is to be increased by 40 per cent.
- 5.1.4 Where a bar keel is fitted, the breadth of the garboard strake is to be not less than 760 mm, and the thickness is to be 10 per cent greater than the bottom shell.
- 5.1.5 The thickness of the bottom shell plating is to be increased by 10 per cent where intercostal girders are not fitted.
- 5.1.6 For increase to sheerstrake at the break of a raised deck, see Pt 4, Ch 1, 5 Shell envelope plating.
- 5.1.7 Cope irons are to be fitted under gallows or any other area where excessive wear could occur.
-

■ Section 6

Shell envelope framing

6.1 Transverse side framing

- 6.1.1 The section modulus of the side frames of single deck trawlers and fishing vessels need not be greater than 80 per cent of the modulus required by Pt 4, Ch 1, 6 Shell envelope framing, but in no case is the depth of the frame to be less than 60 mm. Where not specified the draught is to be taken as not less than $0,85D$.
- 6.1.2 For two deck trawlers and two deck fishing vessels and all vessels requiring a load line, the requirements of Pt 4, Ch 1, 6 Shell envelope framing are to be complied with.
- 6.1.3 The section modulus of frames in the fore peak is to be the greater of the following:
- 10 per cent greater than that required by Pt 3, Ch 5, 4 Shell envelope framing.
 - $$Z = (45D - 212) \text{ cm}^3.$$
- 6.1.4 The section modulus of frames in the aft end region is to be not less than that required by Pt 3, Ch 6, 3 Shell envelope plating.
- 6.1.5 Where frames are stopped at watertight flats they are to be bracketed.
-

■ Section 7

Watertight bulkheads

7.1 Collision bulkheads

- 7.1.1 Consideration will be given to proposals for the collision bulkhead to be positioned further aft than $0,08L$ from the fore end of the classification waterline, provided that bow damage will not result in excessive trim forward.
-

■ Section 8

Stern ramp, and cruiser and transom sterns

8.1 Stern ramp

- 8.1.1 The thickness of plating of the stern ramp is to be not less than:
- $$t = 0,025s \text{ mm or } 10 \text{ mm, whichever is the greater.}$$
- 8.1.2 The section modulus of stiffeners is to be not less than:
-

$$Z = 0,019s / e^2 \text{ cm}^3$$

8.2 Cruiser and transom sterns

8.2.1 Cruiser and transom sterns are to have frames of the size required for peaks, and are to be additionally stiffened by web frames when required. The depth of plate floors is to be not less than that given in Pt 4, Ch 1, 7 Single bottom structure, and the floors are to be associated with a suitable system of girders.

■ *Section 9* **Strengthening of bottom forward**

9.1 General

9.1.1 The requirements of Pt 3, Ch 5, 1 General are to be applied except when the forward draught contemplated for any sea-going condition is equal to or greater than $0,03L$ in which case the bottom shell plating in the region to be strengthened may be taken as:

$$t = 0,00818 s f L^{1/4} k^{1/2}$$

where the symbols are as defined in Table 5.1.1 Additional strengthening of bottom forward in Pt 4, Ch 5 Barges and Pontoons.

This thickness derivation may be adopted for both longitudinal and transverse framing.

Bulk Carriers

■ Section 1

General

1.1 General

1.1.1 This Chapter applies to sea-going self propelled ships, constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in the cargo length area, and intended primarily for the carriage of bulk dry cargoes.

1.1.2 A 'bulk carrier of single side skin construction' is defined as a bulk carrier where one or more cargo holds are bound by the side shell only, or by two watertight boundaries, one of which is the side shell, which are less than 1000 mm apart.

1.1.3 The term 'bulk carrier of double side skin construction' is defined as a bulk carrier where all cargo holds are bound by two watertight boundaries, one of which is the side shell, which are greater than or equal to 1000 mm apart at any location within the hold length.

1.1.4 The ShipRight Procedures for the hull construction of ships are detailed in Pt 3, Ch 16 ShipRight Procedures for the Design, Construction and Lifetime Care of Ships and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2, 3 Surveys - General.

1.1.5 The attention of Owners, Masters and Cargo Shippers is drawn to the IMO Code of Safe Practice for Solid Bulk Cargoes when shipping these cargoes. Attention is also drawn to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered, and any special requirements of the Port Authorities at the ports of loading and discharge.

1.1.6 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 Classification Regulations to which reference should be made.

1.2 Application

1.2.1 Single skin and double skin bulk carriers with length, L , greater than or equal to 90 m with structural configuration as shown in Figure 7.1.1 CSR-BC Applicability are defined as 'CSR Bulk Carriers' and are to comply with Pt 4, Ch 7, 1.4 Class notation for CSR bulk carriers.

Figure 7.1.1: CSR-BC Applicability

1.2.2 Single skin and double skin bulk carriers other than those described in Pt 4, Ch 7, 1.2 Application are defined as 'Non-CSR Bulk Carriers' and are to comply with Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers.

1.3 General class notations

1.3.1 Class notations applicable to CSR bulk carriers are defined as follows:

- **CSR**

Identifies the bulk carrier as being compliant with the *IACS Common Structural Rules for Bulk Carriers and Oil Tankers (CSR)*;

- **ESP**

Identifies the bulk carrier as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, see *also* Pt 1, Ch 2, 2.3 Class notations (hull).

1.3.2 Class notations applicable to non-CSR bulk carriers are defined as follows:

- **Strengthened for heavy cargoes**

For bulk carriers with scantlings complying with Pt 4, Ch 7, 8.2 Carriage of heavy cargoes;

- **ESP**

Identifies the bulk carrier as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3, 3 Intermediate Surveys - Hull and machinery requirements and Pt 1, Ch 3, 6 Special Survey - Bulk carriers - Hull requirements, see *also* Pt 1, Ch 2, 2.3 Class notations (hull);

- **ESN**

Identifies the bulk carrier as having been assessed for enhanced survivability with respect to flooding. Scantlings and arrangements are to comply with Pt 4, Ch 7, 3.1 General, Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition and Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions.

1.4 Class notation for CSR bulk carriers

1.4.1 In general, CSR bulk carriers less than 150 m in length are to comply with the requirements of Pt 4, Ch 7, 1.6 Information required for CSR bulk carriers, Pt 3, Ch 2 Materials and the *IACS Common Structural Rules* (CSR) and will be eligible for one of the following mandatory class notations:

- (a) **100A1 bulk carrier, CSR, any holds may be empty, ESP.** This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1,0 tonne/m³ and above, with an approved arrangement of loaded holds such that any hold may be empty at the full loaded draught.
- (b) **100A1 bulk carrier, CSR, hold, nos. 1, 2 ... may be empty, ESP.** This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1,0 tonne/m³ and above with specified holds empty at maximum draught.
- (c) **100A1 bulk carrier, CSR, ESP.** This class notation will be assigned to a ship designed to carry dry bulk cargoes of cargo density less than 1,0 tonne/m³.

1.4.2 In general, CSR bulk carriers equal to or greater than 150 m in length are to comply with the requirements of Pt 4, Ch 7, 1.6 Information required for CSR bulk carriers, Pt 3, Ch 2 Materials and the *IACS Common Structural Rules* (CSR) and will be eligible for one of the following mandatory class notations:

- (a) **100A1 bulk carrier, CSR, BC-A, hold, nos. 1, 2 ... may be empty, GRAB [X] ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1,0 tonne/m³ and above with specified holds empty at maximum draught.
- (b) **100A1 bulk carrier, CSR, BC-B, GRAB [X], ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1,0 tonne/m³ and above with all cargo holds loaded.
- (c) **100A1 bulk carrier, CSR, BC-C, ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1,0 tonne/m³ with all cargo holds loaded.

1.4.3 The following additional notations and annotations are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design.

- **Notations:**

- (a) **(maximum cargo density (in tonnes/m³))** For notations **BC-A** and **BC-B** if the maximum cargo density is less than 3,0 tonnes/m³,

(no MP) For all notations when the vessel has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in *IACS Common Structural Rules* (CSR), Pt 1, Ch 4, Sec 8,4.2.2:

GRAB [X] where the net thickness of inner bottom, lower strake of hopper tank sloping plate and transverse lower stool plating comply with *IACS Common Structural Rules* (CSR), Pt 2, Ch 1, 6 for **BC-A** and **BC-B**, see *IACS Common Structural Rules* (CSR), Pt 1, Ch 1, Sec 1,3.2.1;

- **Annotations:**

(allowed combination of specified empty holds). For notation **BC-A**.

1.4.4 The 'Construction Monitoring' (CM) procedures detailed in the *ShipRight Procedures Manual*, published by LR, are mandatory for bulk carriers greater than 190 m in length.

1.4.5 Optional notations indicating compliance with specific requirements of Pt 4, Ch 7, 3 Longitudinal strength to Pt 4, Ch 7, 14 Forecastsles on a voluntary basis may also be assigned.

1.5 Class notation for non-CSR bulk carriers

1.5.1 In general, non-CSR Bulk Carriers are to comply with the requirements of Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers to Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers and will be eligible for one of the following mandatory class notations:

- (a) **100A1 bulk carrier, ESP.**
- (b) **100A1 bulk carrier, strengthened for heavy cargoes, ESP.** This class notation will be assigned to a ship when the double bottom structure has been specially strengthened in accordance with the requirements of Table 7.8.1 Strengthening for heavy cargo requirements.
- (c) **100A1 bulk carrier, strengthened for heavy cargoes, hold, nos. 1, 2 ... may be empty, ESP.** This class notation is normally assigned to a ship which has been specially strengthened for heavy cargoes, see Pt 4, Ch 7, 1.5 Class notation for

non-CSR bulk carriers, so as to enable the ship to be fully loaded with an approved arrangement of empty holds, see *also* Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers and Pt 4, Ch 7, 1.4 Class notation for CSR bulk carriers.

- (d) **100A1 bulk carrier, strengthened for heavy cargoes, any holds may be empty, ESP.** This class notation is normally assigned to a ship which has been specially strengthened for heavy and ore cargoes, with an approved arrangement of loaded holds such that any hold may be empty at the full loaded draught.

1.5.2 Plans and information are to be submitted in accordance with Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers.

1.5.3 Requirements are also given for special strengthening for heavy cargoes, see Pt 4, Ch 7, 8.2 Carriage of heavy cargoes.

1.5.4 The scantlings and arrangements of the cargo region are to be as specified in this Chapter in Pt 4, Ch 7, 2 Materials and protection to Pt 4, Ch 7, 14 Forecasts. The requirements are intended to cover the midship region, but also apply, with suitable modification, to the taper regions forward and aft in way of cargo spaces.

1.5.5 The 'Structural Design Assessment' (**SDA**), 'Fatigue Design Assessment' (**FDA**) and 'Construction Monitoring' (**CM**) procedures detailed in the *ShipRight Procedures Manual*, published by LR, are mandatory for non-CSR bulk carriers greater than 190 m in length and for other non-CSR bulk carriers of abnormal hull form, or of unusual structural configuration or complexity see Pt 4, Ch 7, 1.1 General and Pt 4, Ch 7, 11 Direct calculation.

1.5.6 Where the class notation referred to in Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers is assigned such that any hold may be empty at the full draught the following items are to be considered and the corresponding requirements complied with:

- (a) Longitudinal strength calculations are to be carried out for all the operational fully loaded, non-homogeneous, part loaded, heavy cargo conditions, and these conditions included in the approved Loading Manual, see Pt 4, Ch 7, 3 Longitudinal strength. Envelopes of the still water bending moments and the shear forces covering these conditions are also to be submitted.
- (b) The double bottom structure in each hold is to satisfy the requirements of Pt 4, Ch 7, 8.4 Ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'.
- (c) The arrangement and scantlings of cross-deck structure between the upper deck cargo hatchways, see Pt 4, Ch 7, 4.1 General.
- (d) Transverse bulkheads in holds, see Pt 4, Ch 7, 10.1 General.
- (e) For main cargo hatchway openings the requirements of Pt 4, Ch 7, 4.3 Main cargo hatchway openings are to be complied with.

1.5.7 Where appropriate, other cargoes or particular loading arrangements will be included in the class notation. When the class notation referred to in Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers is to be assigned for other combinations of empty and loaded holds, for example where it is the intention to load fully any two adjoining holds with adjacent holds empty in sea-going or short voyage conditions, the longitudinal and local strength aspects will be specially considered, see *also* Pt 4, Ch 7, 4.1 General. In addition, permissible weights of cargo in each hold or pair of adjacent holds, plotted against ship's draught likely to be incurred, are to be included in the ship's approved Loading Manual.

1.5.8 The scantlings of structural items may be determined by direct calculation.

1.5.9 The additional requirements for bulk carriers for the alternate carriage of oil cargo and dry bulk cargo are given in Pt 4, Ch 9, 11 Ships for alternate carriage of oil cargo and dry bulk cargo. When complying with the requirements of this Chapter, such ships may be excluded from all requirements and notations pertaining to vessels with length, *L*, greater than or equal to 150 m. The requirements of Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers are however to be complied with.

1.6 Information required for CSR bulk carriers

1.6.1 In addition to the plans and documents required by the CSR the following are to be submitted:

- Ice strengthening.
- Freeboard plan or equivalent showing freeboards and items relative to the conditions of assignment.
- In addition the supporting calculations given in Pt 3, Ch 1, 5.2 Plans and supporting calculations are to be submitted.

1.7 Information required for non-CSR bulk carriers

1.7.1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, the following are to be submitted:

- Cargo loadings on decks, hatchways and inner bottom if these are to be in excess of Rule, see Pt 3, Ch 3, 5 Design loading.

- The maximum pressure head in service on tanks, also details of any double bottom tanks interconnected with hopper and topside tanks.
- Details of the proposed depths of any partial fillings where water ballast or liquid cargo is intended to be carried in the holds.
- Details of loading arrangements where combinations of empty and loaded holds are envisaged, and where it is the intention to load fully any two adjoining holds with adjacent holds empty in sea-going or short voyage conditions.

1.7.2 Additional information required for bulk carriers of length, L , 150 m or above:

- The bulk cargo density to be used in the design homogeneous loading condition at scantling draught with all holds, including hatchways, being 100 per cent full.
- The maximum bulk cargo density the ship is designed to carry.
- The maximum bulk cargo weight to be carried in each hold.
- Tables or curves indicating the change of cargo hold volume as a function of height above moulded baseline.

1.8 Symbols and definitions

1.8.1 The following symbols and definitions are applicable to this chapter unless otherwise stated: L , B , D , T as defined in Pt 3, Ch 1, 6 Definitions

k_L , k = higher tensile steel factor, see Pt 3, Ch 2, 1 Materials of construction

l = overall length of stiffening member, in metres, see Pt 3, Ch 3, 3 Structural idealisation

l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3, 3 Structural idealisation

s = spacing of secondary stiffeners, in mm

t = thickness of plating, in mm

C = stowage rate, in m³/tonne, as defined in Pt 3, Ch 3, 5 Design loading

I = inertia of stiffening member, in cm⁴, see Pt 3, Ch 3, 3 Structural idealisation

M_H = the actual cargo mass in a cargo hold corresponding to a homogeneously loaded condition at maximum draught

M_{Full} = the cargo mass in a cargo hold corresponding to cargo with virtual density (homogeneous mass/hold cubic capacity, minimum 1,0 tonne/m³) filled to the top of the hatch coaming. M_{Full} is in no case to be less than M_H

M_{HD} = the maximum cargo mass allowed to be carried in a cargo hold according to design Loading conditions with specified holds empty at maximum draught

$R = \sin \theta$

S = spacing, or mean spacing, of primary members, in metres

Z = section modulus of stiffening member, in cm³, see Pt 3, Ch 3, 3 Structural idealisation

ρ = relative density (specific gravity) of liquid carried in a tank, and is not to be taken less than 1,025

θ = roll angle, in degrees

$$\sin \theta = \left(0,45 + 0,1 \frac{L}{B}\right) \left(0,54 - \frac{L}{1270}\right)$$

■ Section 2 Materials and protection

2.1 Materials and grades of steel

2.1.1 Materials and grades of steel are to comply with the requirements of Pt 3, Ch 2 Materials.

2.2 Protection of steelwork

2.2.1 For the protection of steelwork, in addition to the requirements specified in Pt 4, Ch 1, 2 Materials and protection and Pt 3, Ch 2, 3 Corrosion protection the requirements of Pt 4, Ch 7, 2.2 Protection of steelwork are to be complied with.

2.2.2 All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of the cargo holds, except where excluded below, are to have an efficient protective coating (epoxy coating or equivalent) applied in accordance with the manufacturer's recommendations. In the selection of coating, due consideration is to be given to the intended cargo conditions in service. Areas which may remain uncoated are:

- (a) The inner bottom plating.
- (b) The hopper tank sloping plating between the intersection with the inner bottom plating and a line approximately 300 mm below the toe of the side shell frame end brackets.

2.2.3 For the notation '**strengthened for regular discharge by heavy grabs**', see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground.

■ Section 3 Longitudinal strength

3.1 General

3.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 Longitudinal Strength and Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers and Pt 4, Ch 7, 1.5 Class notation for non-CSR bulk carriers where appropriate.

3.1.2 Longitudinal strength calculations for the flooded conditions defined in Pt 4, Ch 7, 3.2 Hull vertical bending stresses for flooded conditions to Pt 4, Ch 7, 3.4 Flooded conditions are to be applied for bulk carriers which satisfy all of the following criteria:

- Single skin construction, or double skin construction where any part of the longitudinal bulkhead is located within B/5 or 11,5 m, whichever is less, inboard from the ship's side at right angles to the centreline at the assigned summer load line.
- Length, L , of 150 m or above.
- Intended for the carriage of cargoes having bulk densities of 1,0 tonne/m³ or above.

3.2 Hull vertical bending stresses for flooded conditions

3.2.1 The maximum hull vertical bending stresses in the flooded condition at deck, σ_{Df} , and keel, σ_{Bf} , for use in Pt 3, Ch 4 Longitudinal Strength are given by the following, using the appropriate combination of bending moments to give sagging and hogging stresses:

$$\sigma_{Df} = \frac{|M_{sf} + 0,8M_w| \times 10^{-3}}{Z_D} \text{ N/mm}^2 (\text{kgf/mm}^2)$$

$$\sigma_{Bf} = \frac{|M_{sf} + 0,8M_w| \times 10^{-3}}{Z_B} \text{ N/mm}^2 (\text{kgf/mm}^2)$$

where

M_{sf} = maximum still water bending moment in the flooded condition, in kN m (tonne-f m), at the section under consideration, see Pt 4, Ch 7, 3.4 Flooded conditions

where

M_w = design hull vertical wave bending moment, in kN m (tonne-f m), as defined in Pt 3, Ch 4, 5 Hull bending strength at the section under consideration

Z_D, Z_B = actual hull section moduli, in m^3 , at strength deck and keel respectively, at the section under consideration.

3.2.2 The maximum values of σ_{Df} and σ_{Bf} are to be used in Pt 3, Ch 4 Longitudinal Strength.

3.3 Shear stresses for flooded conditions

3.3.1 The shear stress, τ_{Af} , in the flooded condition to be used in Pt 3, Ch 4, 6 Hull shear strength, is to be taken as:

$$\tau_{Af} = 100Az \frac{|Q_{sf}| + |0,8Q_w|}{I \delta_i} \text{ N/mm}^2$$

$$\left(\tau_{Af} = 10,2Az \frac{|Q_{sf}| + |0,8Q_w|}{I \delta_i} \text{ kgf/mm}^2 \right)$$

where

Az = the first moment, in cm^3 , about the neutral axis, of the area of the effective longitudinal members between the vertical level under consideration and the vertical extremity of the effective longitudinal members, taken at the section under consideration

Q_{sf} = maximum hull still water shear force, in kN (tonne-f), in the flooded condition at the section under consideration

Q_w = design hull wave shear force, in kN (tonne-f), as defined in Pt 3, Ch 4, 6.3 Design wave shear force at the section under consideration

I = moment of inertia of the hull about the horizontal neutral axis, in cm^4 , at the longitudinal section under consideration

δ_i = defined in Pt 3, Ch 4, 6.5 Permissible still water shear force.

3.4 Flooded conditions

3.4.1 For the relevant loading conditions specified in Pt 3, Ch 4, 5.3 Design still water bending moments and Pt 3, Ch 4, 5.4 Minimum hull section modulus, each cargo hold is to be considered individually flooded up to the equilibrium waterline. The shear forces and still water bending moments are to be calculated for the most severe flooded conditions which will significantly load the ship's structure. Harbour conditions, docking conditions afloat, loading and unloading transitory conditions in port and loading conditions encountered during ballast water exchange need not be considered.

3.4.2 In calculating the weight of ingressed water into the cargo hold under consideration, the permeabilities and bulk densities given in Table 7.3.1 Permeability and bulk density factors are to be used.

Table 7.3.1: Permeability and bulk density factors

Hold condition	Permeability (see Note 1)	Bulk density (tonne/m ³)
Empty cargo space	0,95	-
Volume left in loaded cargo spaces above any cargo	0,95	-
Iron ore cargo	0,3 (see Note 2)	3,0

Bulk Carriers

Part 4, Chapter 7

Section 4

Cement	0,3 (see Note 2)	1,3
<p>Note 1. Bulk cargo permeability is defined as the ratio of the voids within the cargo mass to the volume occupied by the cargo.</p> <p>Note 2. More specific information relating to the bulk cargo may be used where available, but permeabilities are not to be less than those given above.</p> <p>Note 3. For packed cargo, the actual density of the cargo is to be used with a permeability of zero.</p>		

3.4.3 In calculating the strength of the ship's structure in the flooded condition it is to be assumed that the ship's structure will remain fully effective in resisting the applied loads.

Section 4 Deck structure

4.1 General

4.1.1 Longitudinal framing is, in general, to be adopted outside line of openings. The arrangement of structure between hatches is to be such as to ensure continuity of the main deck structure to resist athwartship forces, and transverse stiffening is to be arranged. For and aft knuckles in cross deck strip plating between hatches should be arranged close to longitudinal girders or supported by brackets.

4.1.2 In the case of large bulk carriers with narrow deck strips between hatchways, or where it is the intention to load any two adjoining holds with adjacent holds fully empty for a sea-going condition or for bulk carriers to be classed 'any hold may be empty', the cross deck scantlings will be specially considered.

4.1.3 The requirements of Pt 4, Ch 1, 4 Deck structure are to be applied, together with the requirements of this Section.

4.1.4 The *Shipright FDA Procedure, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations in critical areas, for the deck structure outside the line of openings and between hatches.

4.2 Deck plating

4.2.1 Where the difference between the thickness of plating inside and outside the line of main hatches exceeds 12 mm, a transitional plate of thickness equivalent to the mean of the adjacent plate thicknesses is to be fitted. The plate thickness outside the line of hatches is to be continued inboard between hatches beyond the end of the hatch corner curvature, to ensure that the chamfered plating is clear of the corner tangent point.

4.3 Main cargo hatchway openings

4.3.1 The following requirements apply to bulk carriers with vertically corrugated transverse bulkheads in cargo holds having one or more of the following characteristics:

- (a) $B \geq 40$ m
- (b) $\frac{b}{w} \geq 2,2$

b = breadth of deck opening

w = width of cross deck strip

B = moulded breadth of ship

- (c) A structural arrangement where the hatch side coaming and deck opening are arranged inboard of the topside tank.
- (d) All bulk carriers to be classed 100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP.

4.3.2 The corners of main cargo hatchways in the strength deck are to be rounded with a radius not less than $\frac{1}{20}$ of the breadth of the opening, with a maximum radius of 1000 mm.

4.3.3 Insert plates are to be fitted at the corners having a thickness not less than 25 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 5 mm, see *also* Pt 4, Ch 7, 4.3 Main cargo hatchway openings.

The corner inserts are to be extended transversely into the cross deck plating for a minimum distance equal to $0,075b$, where b , is the breadth of deck opening.

4.3.4 For the extreme corners of the end hatchways of the cargo region furthest from amidships the thickness of the corner insert plates is to be not less than 60 per cent greater than the adjacent deck thickness outside the line of openings.

4.4 Deck supporting structure

4.4.1 For the scantlings of deck longitudinals and transverses in way of topside tanks, see Pt 4, Ch 7, 7.4 Shell and deck structure and Pt 4, Ch 7, 7.5 Primary supporting structure, respectively.

■ *Section 5* **Shell envelope plating**

5.1 General

5.1.1 Longitudinal framing is, in general, to be adopted at the bottom, but special consideration will be given to proposals for transverse framing in this region. The side shell may be longitudinally or transversely framed.

5.1.2 The requirements of Pt 4, Ch 1, 5 Shell envelope plating are to be applied together with the requirements of this Section.

5.2 Bottom shell

5.2.1 The thickness of the bottom shell plating below loaded holds may be required to be increased for local strength considerations.

5.3 Side shell

5.3.1 The thickness of the side shell plating may be required to be increased for shear forces to satisfy the requirements of Pt 4, Ch 7, 3.2 Hull vertical bending stresses for flooded conditions.

5.3.2 The thickness of the side shell plating located between the hopper and topside tanks of single skin bulk carriers is to be not less than:

$$t = \sqrt{L} \text{ mm}$$

■ *Section 6* **Shell envelope framing**

6.1 Longitudinal stiffening

6.1.1 Side frames of all single skin bulk carriers with a hopper are to comply with Pt 4, Ch 7, 6.2 Transverse stiffening and Pt 4, Ch 7, 6.3 Primary supporting structure.

6.1.2 Side frames and end brackets of all double skin bulk carriers are to comply with Pt 4, Ch 1, 6 Shell envelope framing.

6.1.3 Side frames and end brackets of other structural configurations will be specially considered.

6.1.4 The end connections for the longitudinal stiffening are to satisfy the requirements of Pt 3, Ch 10, 3 Secondary member end connections, see *also* Pt 4, Ch 7, 7.6 Structural details and Pt 4, Ch 7, 9.7 Structural details.

6.1.5 The arrangements at the intersections of continuous secondary and primary members are to satisfy the requirements of Pt 3, Ch 10, 5.2 Arrangements at intersections of continuous secondary and primary members and Pt 4, Ch 1, 6.2 Longitudinal stiffening.

6.2 Transverse stiffening

6.2.1 The modulus and inertia of main and topside tank frames in the midship region are to comply with the requirements given in Table 7.6.1 Shell framing. Arrangements of main frames in holds in association with web frames are not recommended in view of the vulnerability to cargo handling damage. Where such web frames are proposed the arrangements and scantlings will be specially considered.

6.2.2 Main frames in the cargo and ballast holds are to have a web thickness not less than:

(a) In general:

$$t_{\min} = 7 + 0,03L \text{ mm,}$$

or 13 mm whichever is the lesser

(b) In the foremost hold:

$$t_{\min} = 1,15 (7 + 0,03L) \text{ mm,}$$

or 15 mm whichever is the lesser

where L is the Rule length, in metres.

6.2.3 The web depth to thickness ratio of the frames is not to be greater than:

$60\sqrt{k}$, for symmetric sections

$50\sqrt{k}$, for asymmetric sections

The breadth to thickness ratio of the flange outstand is not to be greater than:

$$10\sqrt{k}$$

6.2.4 The upper and lower end brackets of the main frames in the cargo and ballast holds are to satisfy the requirements of Pt 4, Ch 7, 6.2 Transverse stiffening to Pt 4, Ch 7, 6.2 Transverse stiffening inclusive, based on the mild steel section modulus Z in cm^3 , derived from Table 7.6.1 Shell framing, or the equivalent mild steel section modulus for higher tensile steel frames.

6.2.5 The lengths of the arms of the brackets, measured as shown in Figure 7.6.1 Diagrammatic arrangement of end brackets, are not to be less than:

(a) Frame connection to hopper tank.

Athwartship arm:

$$\text{Dry cargo hold } l_a = 32,43\sqrt{Z} \text{ mm}$$

$$\text{Ballast hold } l_a = 32,43(\sqrt{Z} - 7,5) \text{ mm}$$

Vertical arm:

$$\text{Dry cargo hold } l_v = 27,6\sqrt{Z} \text{ mm}$$

$$\text{Ballast hold } l_v = 27,6(\sqrt{Z} - 9,0) \text{ mm}$$

(b) Frame connection to topside tank

Athwartship arm:

$$\text{Dry cargo hold } l_a = 30,0\sqrt{Z} \text{ mm}$$

$$\text{Ballast hold } l_a = 30,0(\sqrt{Z} - 9,0) \text{ mm}$$

Vertical arm:

$$\text{Dry cargo hold } l_v = 26,85\sqrt{Z} \text{ mm}$$

$$\text{Ballast hold } l_v = 26,85(\sqrt{Z} - 11,0) \text{ mm}$$

In no case are the bracket arm lengths to be taken less than $0,125H$, where H is as defined in Table 7.6.1 Shell framing.

Table 7.6.1: Shell framing

Location	Modulus, in cm ³	Inertia, in cm ⁴
(1) Main frames in dry cargo holds	$Z = 3,50skh_{T1} H^2 \times 10^{-3}$	$I = \frac{3,2}{k} HZ$
(2) Main frames in cargo holds used for water ballast	The greater of the following: (a) $Z = 1,15 \times$ modulus given in (1) (b) $Z = 6,7skh_4 H^2 \times 10^{-3}$	$I = \frac{3,2}{k} HZ$
(3) Transverse frames in topside wing tanks	The greater of the following: (a) $1,15 \times Z$ as given in location (1) of Table 1.6.3 Shell framing (transverse) (b) As required by Pt 4, Ch 7, 7.3 Bulkhead stiffeners for the sloped bulkhead stiffeners	$I = \frac{3,2}{k} HZ$
Symbols		
<p>D, T, s, k = as defined in Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers</p> <p>h_{T1} = head, in metres, at middle of H</p> <p>$= C_W \left(1 - \frac{h_6}{D-T} \right) F_\lambda$ in metres, for frames where the mid-length of frame is above the summer load waterline,</p> <p>$= \left(1 - \frac{h_6}{D-T} \right)$ is not to be taken less than 0,7</p> <p>$= (h_6 + C_w \left(1 - \frac{h_6}{2T} \right)) F_\lambda$, in metres, where the mid-length of frame is below the summer load waterline</p> <p>h_4 = head, in metres, measured from the middle of H to the deck at side, or half the distance from the middle of H to the top of the overflow, whichever is greater.</p> <p>h_6 = vertical distance in metres, from the summer load waterline at draught T to the mid-length of H</p> <p>C_w = a wave head, in metres</p> <p>$= 7,71 \times 10^{-2} L e^{-0,0044L}$</p> <p>= where e = base of natural logarithms 2,7183</p> <p>F_λ = 1,0 for $L \leq 200$ m</p> <p>= $(1,0 + 0,0023 (L - 200))$ for $L > 200$ m</p> <p>H = length overall of frame, in metres, but is to be taken not less than 2,5 m</p>		

6.2.6 The section modulus of the frame and bracket or integral bracket, and associated shell plating at the location marked Z_a in Figure 7.6.1 Diagrammatic arrangement of end brackets is to be not less than $2,0Z$.

In addition, the minimum depth of the frame and bracket or integral bracket at the location indicated in Figure 7.6.1 Diagrammatic arrangement of end brackets is to be not less than $1,5d$.

6.2.7 The upper and lower integral or separate brackets are to have a web thickness not less than the as built web thickness of the side frame. In addition, the lower bracket thickness is to be not less than:

$$t = t_{\min} + 2 \text{ mm, where } t_{\min} \text{ is derived from Pt 4, Ch 7, 6.2 Transverse stiffening}$$

The toes of the brackets are to be designed to avoid notch effects by making the upper and lower toes concave or otherwise tapering them off, see also Pt 3, Ch 10, 5.1 Continuity and alignment.

6.2.8 Except as indicated in Pt 4, Ch 7, 6.2 Transverse stiffening, frames are to be fabricated symmetrical sections with integral upper and lower brackets.

The side frame face plate is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature, r , is to be not less than:

$$r = \frac{0,4b_f^2}{t_f} \text{ mm}$$

where

b_f = breadth of the bracket face plate, in mm

t_f = thickness of the bracket face plate, in mm

The brackets are to be arranged with soft toes and the frame section face bar tapered symmetrically to the toes with a taper rate not exceeding 1 in 3. Where the free edge of the bracket is hollowed out, it is to be stiffened or increased in size to ensure that the section modulus of the bracket through the throat is not less than that of the required straight edged bracket.

6.2.9 In ships of length, L , less than 190 m, mild steel fabricated frames may be asymmetric and fitted with separate brackets. Brackets are to be arranged with soft toes. The free edges of the brackets are to be stiffened as follows:

(a) Where a flange is fitted, its breadth, b_f , is to be not less than:

$$b_f = 40 \left(1 + \frac{Z}{1000} \right) \text{ mm}$$

or 50 mm, whichever is the greater

The flange is to be tapered at the ends with a taper rate not exceeding 1 in 3.

(b) Where the edge is stiffened by a welded face flat, the cross-sectional area of the face flat is to be not less than:

(i) $0,009 b_f t \text{ cm}^2$ for offset edge stiffening

(ii) $0,014 b_f t \text{ cm}^2$ for symmetrically placed stiffening

where

t = web thickness of bracket, in mm

The face plate is to be tapered at the ends with a taper rate not exceeding 1 in 3.

6.2.10 For mild steel construction with separate brackets where the frames are lapped on to the bracket, the length of the overlap is to be adequate to provide for the required area of welding to achieve equivalent strength.

6.2.11 Double continuous welding is to be adopted for the connections of frames and brackets to side shell, hopper and topside tank plating and web to face plates. For this purpose, the following weld factors are to be adopted:

- 0,44 in Zone 'a' and
- 0,40 in Zone 'b', see Figure 7.6.1 Diagrammatic arrangement of end brackets.

Where the hull form is such that an effective fillet weld cannot be made, edge preparation of the web of the frame and bracket may be required, in order to ensure the required efficiency of the weld connection.

4591/01

Figure 7.6.1: Diagrammatic arrangement of end brackets

6.2.12 Continuity of the frames is to be maintained by supporting brackets, see Figure 7.6.2 Supporting brackets in topside and hopper tanks, in the topside and hopper tanks. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint. For this purpose, in the hopper and topside tanks, the thickness of the supporting brackets (which must align with the hold main frame brackets) is to be not less than the following:

(a) Lower brackets (in hopper tank):

$$t = t_{\min} + 0,5 \text{ mm, where } t_{\min} \text{ is derived from Pt 4, Ch 7, 6.2 Transverse stiffening or}$$

$$t = 9,0 \text{ mm}$$

whichever is the greater.

(b) Upper brackets (in topside tank):

$$t = t_{\min}, \text{ where } t_{\min} \text{ is derived from Pt 4, Ch 7, 6.2 Transverse stiffening or}$$

$$t = 9,0 \text{ mm}$$

whichever is the greater.

The size and arrangement of stiffening of the supporting brackets will be specially considered. Where the toe of the hold frame bracket is situated on or in close proximity to the first longitudinal from the shell of the hopper or topside tank sloped bulkheads, the supporting brackets are to be extended to the next longitudinal. This extension is to be achieved by enlarging the supporting bracket or by fitting an intercostal flat bar stiffener the same depth as the longitudinal and connected to the webs of the longitudinals.

6.2.13 The requirements are to be maintained throughout the cargo hold region. However, in the forward and aft cargo holds where the shape becomes finer because of the ship form, increased requirements may be necessary and each case will be specially considered.

6.2.14 In way of the foremost hold, side frames of asymmetric section are to be effectively supported by intercostal brackets, see Figure 7.6.3 Typical arrangement of intercostal brackets supporting asymmetric side shell frames in No. 1 hold.

Figure 7.6.3: Typical arrangement of intercostal brackets supporting asymmetric side shell frames in No. 1 hold

6.2.15 The hold side shell frame adjacent to the collision bulkhead is to be suitably strengthened. As an alternative, at least two supporting structures are to be fitted which align with the forepeak stringers or flats, see Figure 7.6.4 Hold frame supporting structures at fore end of No. 1 cargo hold. The supporting structures are to have adequate cross-sectional shear resisting area at their connections to the hold frame.

6.2.16 Detail design guidelines for connection of side shell frames to hopper and topside tank plating are shown in the *Shipright FDA Procedure, Structural Detail Design Guide (SDDG)*.

6.3 Primary supporting structure

6.3.1 For the requirements for primary supporting structure, see Pt 4, Ch 7, 7.5 Primary supporting structure and Pt 4, Ch 7, 9.6 Primary supporting structure.

Figure 7.6.4: Hold frame supporting structures at fore end of No. 1 cargo hold

■ **Section 7** **Topside tank structure**

7.1 General

7.1.1 Requirements are given in this Section for longitudinal or transverse framing in the topside tank, but, in general, the deck is to be longitudinally framed. The sloped bulkhead is to be of plane construction with the associated stiffening arranged inside or outside the tank.

7.1.2 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

7.1.3 Recommended examples of structural design configurations around the transverse ring web of the topside tank can be seen in the *ShipRight FDA Procedure, Structural Detail Design Guide (SDDG)*.

7.2 Bulkhead plating

7.2.1 The thickness of the sloped bulkhead, tank end bulkhead, and diaphragm, if fitted, is to be the greater of the following:

- (a) For watertight bulkheads, the thickness, t , as derived from Table 1.9.1 Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships for a deep tank bulkhead using a head, h_4 , in metres, determined as follows:

$$h_4 = h_o \cos \theta + Rb_1 \text{ or}$$

= the greater of the distance from a point one-third of the height of the plate above its lower edge to the top of the tank, or half the distance to the top of the overflow

whichever is the greater, or

- (b) $t = 7.5 \text{ mm}$

In no case, however, is the thickness of the sloped bulkhead and diaphragm to be taken less than:

- (i) $t = 0,012s \text{ mm, or}$

$$t = 0,012s \sqrt{\frac{F_D}{k_D}} \text{ mm}$$

whichever is the greater

where

k_D = the higher tensile steel factor equal to k_L value for deck material

F_D = as defined in Pt 3, Ch 4, 5.7 Local reduction factors

R = as defined in Pt 4, Ch 7, 1.8 Symbols and definitions

h_o = the vertical distance, in metres, from a point one third of the height of the plate from the lower edge to the highest point of the tank excluding hatchway

b_1 = the larger horizontal distance, in metres, from the tank corner at top of tank either side to point of plate under consideration.

7.2.2 The thickness of the top strake of the sloped bulkhead, including the vertical plate attached to deck, may be required to be increased to form an effective girder below the deck. In general, this plate is to be not less in thickness than 60 per cent of the thickness of the deck plate outside the line of openings nor less than:

$$(a) \quad t = 0,018s \text{ mm, or}$$

$$(b) \quad t = 0,018s \sqrt{\frac{F_D}{k_D}} \text{ mm}$$

(a) whichever is the greater.

7.2.3 The thickness of the transverse wash bulkhead, where fitted, is to be not less than:

$$t = 0,012s \text{ mm or } 7,5 \text{ mm}$$

= whichever is the greater.

7.3 Bulkhead stiffeners

7.3.1 The section modulus of longitudinal or transverse stiffeners on the sloped bulkhead or watertight diaphragms, if fitted, is to be not less than:

$$Z = 0,01skh_4 l_e^2 \text{ cm}^3$$

where

$$h_4 = h_o \cos\theta + Rb_1$$

= the greater of the distance, in metres, from the middle of the effective length to the top of the tank, or half the distance to the top of the overflow, or

= 1,5 m

= whichever is the greatest

R = as defined in Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers

h_o = the vertical distance, in metres, from the mid-point of span of the stiffener to the highest point of the tank excluding hatchway

b_1 = the larger horizontal distance, in metres, from the tank corner at top of tank, either side to midpoint of span.

7.3.2 Where the bulkhead stiffening is fitted on the hold side of the sloped bulkhead, suitable arrangements are to be made to prevent tripping.

7.3.3 The scantlings of stiffeners on tank end bulkheads are to be not less than those given in Table 1.9.1 Watertight and deep tank bulkhead scantlings of Pt 4, Ch 1 General Cargo Ships for deep tanks, using h as defined in Pt 4, Ch 7, 7.3 Bulkhead stiffeners.

7.3.4 The section modulus of stiffeners of non-watertight fore and aft diaphragms, or transverse wash bulkheads is to be not less than 50 per cent of that required by Pt 4, Ch 7, 7.3 Bulkhead stiffeners. The stiffeners are to be bracketed at both ends.

7.3.5 Tank end bulkheads are generally to be in line with the main hold bulkheads.

7.4 Shell and deck structure

7.4.1 The scantlings of shell and deck longitudinals are to comply with Pt 4, Ch 7, 7.3 Bulkhead stiffeners. The scantlings must also satisfy the requirements of Pt 4, Ch 1 General Cargo Ships, see *also* Pt 4, Ch 7, 7.6 Structural details.

7.4.2 The scantlings of side shell frames are to comply with Pt 4, Ch 7, 6.2 Transverse stiffening.

7.5 Primary supporting structure

7.5.1 The section modulus and inertia of deck, shell and bulkhead transverses or stringers are to be not less than:

$$Z = 7,5 k S h l^2 e \text{ cm}^3$$

$$I = \frac{2,5}{k} l_e Z \text{ cm}^4$$

using h as defined in Pt 4, Ch 7, 7.3 Bulkhead stiffeners. The scantlings of shell and deck members must also satisfy the requirements of Pt 4, Ch 1 General Cargo Ships for dry cargo holds.

7.5.2 Primary transverse members are, in general, to be spaced not more than 3,8 m apart where the length, L , is 100 m or less, and $(0,006L + 3,2)$ m apart for lengths greater than 100 m.

7.5.3 Transverses are to be arranged in line with the primary structure at ends of hatchways, or equivalent scarfing arranged. Where the sloped bulkhead or side shell is transversely framed, arrangements are to be made to ensure effective continuity at the ends of the deck transverse.

7.5.4 Where non-watertight transverse diaphragms are arranged instead of open transverses, the thickness of plating is to be in accordance with Pt 4, Ch 7, 7.2 Bulkhead plating. The diaphragms are to be efficiently stiffened.

7.6 Structural details

7.6.1 Bracket/diaphragm connections at the bottom of the topside tank are to be of sufficient size and thickness to provide effective rigidity, and care is to be taken to ensure alignment with brackets at the heads of the side frames in the holds, see *also* Pt 4, Ch 7, 6.2 Transverse stiffening. The shell and sloped bulkhead longitudinals supporting the diaphragms are to be derived using the span taken between transverses.

7.6.2 For ships where $L \geq 300$ m a fore and aft diaphragm extending vertically from the deck to the sloping plating of the topside tank is to be arranged at about the half-width of the tank.

7.6.3 Where longitudinal framing is fitted to the side shell, a bracket may be required in way of a rounded gunwale, approximately halfway between transverses and extending to the adjacent shell and deck longitudinal.

■ Section 8

Double bottom structure

8.1 General

8.1.1 The double bottom is, in general, to be longitudinally framed, but special consideration will be given to proposals for a transverse framing system.

8.1.2 The requirements of Pt 4, Ch 1, 8 Double bottom structure are to be applied, together with the requirements of this Section, see *also* Pt 4, Ch 7, 2.2 Protection of steelwork.

8.1.3 Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and top-side tanks, the double bottom scantlings are also to satisfy the requirements of Table 7.8.1 Strengthening for heavy cargo requirements (3)(c), (3)(d), (4)(c) and (4)(d) for ballast holds and (3)(c) and (4)(c) in way of dry cargo holds, see *also* Pt 4, Ch 1, 6.2 Longitudinal stiffening.

8.1.4 The requirements given in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition are to be applied to bulk carriers which satisfy the following criteria:

- Single skin construction, or double skin construction where any part of the longitudinal bulkhead is located within B/5 or 11,5 m, whichever is less, inboard from the ship's side at right angles to the centreline at the assigned summer load line.

- Length, L , of 150 m or above.
- Intended for the carriage of cargoes having bulk densities of 1,0 tonne/m³ or above.

8.1.5 For all bulk carriers where bulk cargoes are discharged by grabs the maximum recommended unladen weight of the grab corresponding to the approved inner bottom plating thickness is to be calculated using the following formulae:

$$P = \left(\frac{s}{k}\right)^2 \frac{10^d}{1,775} \text{ tonnes}$$

where:

$$d = \frac{40,875(t - 1,5)\sqrt{k} + 344,5}{s} - 5,7633$$

P = unladen grab weight, in tonnes

s = spacing of inner bottom longitudinal, in mm

k = higher tensile steel factor as defined in Pt 4, Ch 7, 1.8 Symbols and definitions

t = thickness of inner bottom plating, in mm

The maximum recommended unladen weight of the grab rounded up to the next tonne above, is to be recorded in the Loading Manual (see also Pt 3, Ch 4, 8.2 Loading Manual), and does not preclude the use of heavier grabs. It is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.

8.1.6 Detail design guidelines for stiffeners connecting inner bottom and bottom longitudinals are shown in the *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG).

Table 7.8.1: Strengthening for heavy cargo requirements

Symbols	Item	Requirement
L, l_e, D, T, s, S, k, Z and t as defined in Pt 4, Ch 7, 1.8 Symbols and definitions	(1) Double bottom floors	The spacing of floors, generally, is not to exceed 2,5 m. Scantlings are to comply with the requirements of Pt 4, Ch 1, 8.5 Floors
C_1 = a factor varying from 1,0 at $\frac{D}{2}$ to $\frac{75}{225 - 150F_B}$ at base line of ship	(2) Double bottom side girders	The spacing of side girders, generally, is not to exceed 3,7 m. Scantlings are to comply with the requirements of Pt 4, Ch 1, 8.3 Girders
C = stowage rate, in m ³ /tonne, and is defined as the volume of the hold excluding the volume contained within the depth of the cargo hatchway divided by the weight of cargo stowed in the hold. The value is not to be taken greater than 0,865	(3) Inner bottom plating, see Note 3	The thickness of the inner bottom plating in the holds is to be not less than required by the greatest of the following: (a) $t = 0,00136 (s + 660) \sqrt[4]{k^2 LT} + 5$ mm, or (b) $t = 0,00455s \sqrt{\frac{Hk}{C}}$ mm, or (c) Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and topside tanks the scantlings are also to satisfy the requirements for deep tanks in Table 1.9.1 Watertight and deep tank bulkhead scantlings in Chapter 1, with the load head h_4 , $= h_0 \cos \theta + Rb_1$ m (d) In way of ballast holds the scantlings are also to satisfy the requirements for deep tanks in Table 1.9.1 Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships, with the load head h_4 , in metres, measured to the deck at centre, but see also Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground if protection against heavy grabs is desired.
F_B as defined in Pt 3, Ch 4, 5.7 Local reduction factors	(4) Inner bottom longitudinals see Notes 1 and 2	The section modulus of inner bottom longitudinals is to be not less than the greatest of the following: (a) $Z = 85$ per cent of the Rule value for bottom longitudinals as given in Table 1.6.2 (b) Shell framing (longitudinal) Pt 4, Ch 1 General Cargo Ships, or (b) $Z = \frac{0,0083sl_e^2 HC_1 k}{\left(1 - 0,233 \frac{1}{D}\right) C}$ cm ³ or (c) Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and topside tanks $Z = 0,0073skh_4 l_e^2$ cm ³ where $h_4 = h_0 \cos \theta + Rb_1$ m. Z is not to be less than the requirements for deep tanks in Table 1.9.1 Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships, with the load head h_4 , in metres, measured to the highest point of the topside tank, or side tank, or (d) In way of ballast holds the section modulus of the longitudinals is to be not less than required for deep tanks in Table 1.9.1 Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships, with the load head h_4 , in metres, measured to the deck at centre
H = height from tank top, at position under consideration, to deck at side amidships, in metres		
Y_1 = distance from $\frac{D}{2}$ to tank top, in metres		
h_0 = for plating and stiffeners the vertical distance, in metres, from the inner bottom to the highest point of the tank excluding hatchway		
b_1 = the larger horizontal distance, in metres, from the tank corner at top of tank either side to the point of plate or stiffener under consideration		
<p>Note 1. If plate girders are fitted alternatively with built or rolled sections, the section modulus as given in (4)(b) may be reduced by 10 per cent.</p> <p>Note 2. Consideration will be given to the fitting of struts in way of double bottom tanks in ships with homogeneous loading. The arrangement and scantlings are, in general, to be confirmed by direct calculation.</p> <p>Note 3. See also Pt 4, Ch 7, 8.1 General for the maximum recommended unladen weight of the grab corresponding to the approved inner bottom plating thickness.</p>		

8.2 Carriage of heavy cargoes

8.2.1 When the notation 'strengthened for heavy cargoes' is to be assigned, the requirements of Table 7.8.1 Strengthening for heavy cargo requirements are to be complied with.

8.3 Carriage of heavy cargoes with specified or alternate holds empty

8.3.1 For ships strengthened for heavy cargoes and having a class notation permitting specified or alternate holds to be empty, the requirements of Pt 4, Ch 7, 8.2 Carriage of heavy cargoes are to be complied with. In addition the scantlings and arrangements of the primary structure are to be confirmed by additional calculations, see Pt 4, Ch 7, 11.1 Application.

8.4 Ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'

8.4.1 For ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP', the requirements of Pt 4, Ch 7, 8.2 Carriage of heavy cargoes and Pt 4, Ch 7, 8.3 Carriage of heavy cargoes with specified or alternate holds empty are to be complied with. In addition the value for C, the stowage rate in m³/tonne, as defined in Table 7.8.1 Strengthening for heavy cargo requirements, is not be taken greater than 0,60 for each hold.

8.5 Ballast ducts

8.5.1 Where ballast ducts are arranged in lieu of suction and/or filling pipes, the scantlings will be approved as suitable for a specified equivalent static head of water. This head must not be exceeded in service, and details of methods to ensure this are to be submitted. The continuity of the floors is to be maintained in way of the ducts.

8.6 Structural details in way of double bottom tank and hopper tank knuckle

8.6.1 In all dry holds where the double bottom tank and hopper tank knuckle is of radiused construction and the floor spacing is 2,5 m or greater brackets shown as in Figure 7.8.1 Intermediate brackets at knuckle are to be arranged mid-length between floors in way of the intersection. The brackets are to be attached to the adjacent inner bottom and hopper longitudinals. The thickness of the brackets is to be in accordance with Pt 4, Ch 1, 8.5 Floors but need not exceed 15 mm. This requirement does not apply where the double bottom tank and hopper tank knuckle is of welded construction.

Figure 7.8.1: Intermediate brackets at knuckle

8.6.2 In way of floodable holds, two intermediate bracket arrangements, as shown in Figure 7.8.1 Intermediate brackets at knuckle, are to be provided in all cases where the hopper to double bottom knuckle is radiused and are, in general, to be located at each frame space. Where the double bottom tank and hopper tank knuckle is of welded construction, a single intermediate bracket arrangement, as shown in Figure 7.8.1 Intermediate brackets at knuckle, is to be provided only when the floor spacing is greater than 2,5 m.

8.6.3 The connections at the intersection are to be as follows:

-
- (a) Where of welded construction the corner scallops in floors and transverses are to be omitted, or closed by welded collars where arranged for purposes of construction. In such cases to ensure satisfactory welding of the collars the radius of the scallops should not be less than 150 mm, see Figure 7.8.2 Connection at intersection of double bottom and hopper. Alternatively the scallop may be retained on the hopper tank side provided gusset plates are arranged in line with the inner bottom plating, see Figure 7.8.2 Connection at intersection of double bottom and hopper.
- (b) Where of radiused construction the corner scallops are to be omitted, and full penetration welding is to be arranged locally for the connection to the inner bottom plating. The centre of the flange is not to be greater than 70 mm from the side girder, see Figure 7.8.2 Connection at intersection of double bottom and hopper.

8.6.4 Detail design guidelines for the connection of hopper tank sloping plating to inner bottom plating are shown in the *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG).

8.7 Combined double bottom/hopper tank and topside tank

8.7.1 Where a double bottom/hopper tank is interconnected with a topside tank the dimensions of the connecting trunks or pipes, and the air/overflow pipe(s) and the type of closing appliance are to comply with the requirements of Pt 5, Ch 13, 12 Air, overflow and sounding pipes.

8.8 Allowable hold loading in the flooded condition

8.8.1 The requirements of this sub-Section are to be applied as defined in Pt 4, Ch 7, 8.1 General.

8.8.2 The maximum load which may be carried in each cargo hold in combination with flood water is to be determined for the most severe homogeneous, non-homogeneous and packed cargo conditions contained in the Loading Manual. The maximum density of cargo intended to be carried in each condition is to be used.

Figure 7.8.2: Connection at intersection of double bottom and hopper

8.8.3 The ship is to be assumed immersed to the draught, T_F , in metres, in way of the flooded cargo hold under consideration. The flooding head, h_f , see Figure 7.8.3 Loading, is to be taken as the distance, in metres, measured vertically with the ship in the upright position, from the inner bottom to position, d_f , in metres, from the baseline given by:

- (a) In general:
- (i) $d_f = D$ for the foremost hold
 - (ii) $d_f = 0,9D$ for other holds
- (b) For ships less than 50 000 tonnes deadweight with Type B freeboard:
- (i) $d_f = 0,95D$ for the foremost hold
 - (ii) $d_f = 0,85D$ for other holds

where

D = distance, in metres, from the baseline to the freeboard deck at side amidships.

Figure 7.8.3: Loading

8.8.4 For this application, the double bottom is defined as the structure bounded by the transverse bulkhead lower stools (or bulkhead plating if no lower stools are fitted) and the hopper sides. The floors and girders immediately in way of these structures are excluded.

8.8.5 The determination of shear strength required for the permissible load assessment in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition, is to be performed using the net plate thickness, t_{net} , for the floors and girders:

$$t_{net} = t - t_c$$

where

t = as built thickness, in mm

t_c = thickness deduction for corrosion, in mm, generally to be taken as 2,5 mm.

8.8.6 Shear capacity of the double bottom is defined as the sum of the shear strengths for:

- (a) all the floors adjacent to both hoppers, less one half the strength of the floors adjacent to each lower stool (or transverse bulkhead if no lower stool is fitted), see Figure 7.8.4 Double bottom structure, and
- (b) all the girders adjacent to the lower stools (or transverse bulkheads if no lower stool is fitted).

Where a girder or floor terminates without direct attachment to the boundary stool or hopper side girder, its shear capacity is to include only that for the effectively connected end.

8.8.7 The shear strengths, S_{f1} , of floors adjacent to hoppers, and S_{f2} , of floors in way of openings in bays nearest to the hoppers, are as follows:

$$S_{f1} = 0,001 A_f \tau_p / \eta_1 \text{ kN (tonne-f)}$$

$$S_{f2} = 0,001 A_{f,h} \tau_p / \eta_2 \text{ kN (tonne-f)}$$

where

A_f = net sectional area, in mm², of floor panel adjacent to hopper

$A_{f,h}$ = net sectional area, in mm², of floor panel in way of opening in the bay closest to hopper

$$\eta_1 = 1,10$$

$$\eta_2 = 1,20 \text{ generally}$$

= 1,10 where appropriate reinforcement is fitted in way of the opening

σ_0 = specified minimum yield stress, in N/mm² (kgf/mm²)

τ_p = permissible shear stress, to be taken equal to the lesser of:

$$\tau_0 = \frac{\sigma_0}{\sqrt{3}} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{) and}$$

$$\tau_c = \frac{162 \sigma_0^{0,6}}{(s_1/t_{\text{net}})^{0,8}} \text{ N/mm}^2$$

$$(\tau_c = \frac{65 \sigma_0^{0,6}}{(s_1/t_{\text{net}})^{0,8}} \text{ kgf/mm}^2)$$

where

s_1 = spacing of stiffening members, in mm, for the panel under consideration

t_{net} = net thickness, in mm, of the panel under consideration.

For floors adjacent to the stools (or bulkhead plating if no lower stools are fitted), τ_p may be taken as $\frac{\sigma_0}{\sqrt{3}} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$.

8.8.8 The shear strengths S_{g1} , of girders adjacent to transverse bulkhead lower stools (or transverse bulkheads if no lower stools are fitted), and S_{g2} , of girders in way of the largest openings in bays nearest to the lower stools (or transverse bulkheads if no lower stools are fitted), are as follows:

$$S_{g1} = 0,001 A_g \tau_p / \eta_1 \text{ kN (tonne-f)}$$

$$S_{g2} = 0,001 A_{g,h} \tau_p / \eta_2 \text{ kN (tonne-f)}$$

where

A_g = net sectional area, in mm², of the girder adjacent to transverse bulkhead lower stool (or transverse bulkhead, if no lower stool is fitted)

$A_{g,h}$ = net sectional area, in mm², of the girder in way of the largest openings in the bays closest to the transverse bulkhead lower stool (or transverse bulkhead if no lower stool is fitted)

$$\eta_1 = 1,10$$

$$\eta_2 = 1,15 \text{ generally}$$

= 1,10 where appropriate reinforcement is fitted in way of the opening.

8.8.9 The permissible cargo hold loading, W_p , is given by:

$$W_p = g \rho_c V / F_c \text{ kN}$$

$$(W_p = \rho_c V / F_c \text{ tonne-f})$$

where

d_f, D = as defined in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition

where

g = gravitational constant, 9,81 m/sec²

h_f = flooding head, in metres, as defined in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition

$h_1 = \frac{X}{\rho_c g}$ where Y is in kN/m²

$(h_1 = \frac{X}{\rho_c}$ where Y is in tonne-f/m²)

n = number of floors between transverse bulkhead lower stools or transverse bulkheads, if no lower stools are fitted

s = spacing, in metres, of double bottom longitudinals adjacent to hoppers

$$A_{DB,e} = \left[\begin{array}{c} n \\ \Sigma \\ i=1 \end{array} \right] S_i (B_{DB} - s)$$

$$A_{DB,h} = \left[\begin{array}{c} n \\ \Sigma \\ i=1 \end{array} \right] S_i B_{DB,i}$$

B_{DB} = breadth of double bottom, in metres, between hoppers see Figure 7.8.5 Double bottom breadth

$B_{DB,h}$ = distance, in metres, between openings see Figure 7.8.5 Double bottom breadth

$B_{DB,i} = (B_{DB} - s)$ for floors where shear strength is given by S_{f1}

= $B_{DB,h}$ for floors where shear strength is given by S_{f2}

C_e = shear capacity of the double bottom, in kN (tonne- f), as defined in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition, considering for each floor, the shear strength S_{f1} , see Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition, and for each girder, the lesser of the shear strengths S_{g1} and S_{g2} , see Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition

C_h = shear capacity of the double bottom, in kN (tonne- f), as defined in Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition, considering for each floor, the lesser of the shear strengths S_{f1} and S_{f2} , see Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition, and for each girder, the lesser of the shear strengths S_{g1} and S_{g2} , see Pt 4, Ch 7, 8.8 Allowable hold loading in the flooded condition

$F_c = 1,1$ in general

= 1,05 for steel mill products

S_i = spacing of i th floor, in metres

$T_F = d_f - 0,1D$

V = volume, in m³, occupied by cargo at a level h_1

X = the lesser of X_1 and X_2 for bulk cargoes and

$X = X_1$ for steel mill products

where

$$X_1 = \frac{Y + \rho g (T_F - h_f)}{1 + \left(\frac{\rho}{\rho_c} \right) (\mu - 1)} \text{ where } Y \text{ is in kN/m}^2$$

$$(X_1 = \frac{Y + \rho (T_F - h_f)}{1 + \left(\frac{\rho}{\rho_c} \right) (\mu - 1)} \text{ where } Y \text{ is in tonne-f/m}^2)$$

where

$$X_2 = Y + \rho g (T_F - h_f \mu) \text{ where } Y \text{ is in kN/m}^2$$

$$(X_2 = Y + \rho (T_F - h_f \mu) \text{ where } Y \text{ is in tonne-f/m}^2)$$

Y = the lesser of Y_1 and Y_2 given by:

$$Y_1 = \frac{C_h}{A_{DB,h}}$$

$$Y_2 = \frac{C_e}{A_{DB,e}}$$

μ = permeability of cargo but need not exceed 0,3

= 0,0 for steel mill products

ρ = density of sea water, 1,025 tonne/m³

ρ_c = cargo density, in tonne/m³ (bulk density for bulk cargoes and actual cargo density for steel mill products).

Figure 7.8.5: Double bottom breadth

Section 9 Hopper side tank structure

9.1 General

9.1.1 Provision is made in this Section for longitudinal framing of the hopper side tank, but proposals for transverse framing will be specially considered.

9.1.2 Where oil cargoes are carried the scantlings of the sloped bulkhead are to comply with the requirements of Pt 4, Ch 7, 10.2 Bulkheads supported by stools.

9.1.3 For ships to be classed '**100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP**', the requirements of Pt 4, Ch 7, 9.2 Sloped bulkhead plating, Pt 4, Ch 7, 9.3 Sloped bulkhead stiffeners and Pt 4, Ch 7, 9.6 Primary supporting structure are to be complied with. In addition the value for C , the stowage rate in m³/tonne, as defined in Table 7.8.1 Strengthening for heavy cargo requirements, is not be taken greater than 0,60 for each hold.

9.1.4 The buckling requirements of Pt 3, Ch 4, 7 Hull buckling strength are also to be satisfied.

9.1.5 The *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG), indicates recommended details of structural design configurations around the transverse ring web of the hopper tank.

9.2 Sloped bulkhead plating

9.2.1 The thickness of the sloped bulkhead plating is to be as required by Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening but based on actual spacing of sloped bulkhead stiffeners.

9.2.2 Where the ship is regularly discharged by grabs and the optional notation for heavy grabs is not desired (see Pt 3, Ch 9, 7 Bottom strengthening for loading and unloading aground), the increase in thickness, as required by Pt 4, Ch 1, 2.2 Protection of steelwork, is to be tapered from the inner bottom knuckle to nil at the top corner of the tank.

9.2.3 Where a 'strengthened for heavy cargo notation' is desired, in addition to Pt 4, Ch 7, 9.2 Sloped bulkhead plating the thickness of the sloped bulkhead plating is also to comply with the requirements of Table 7.8.1 Strengthening for heavy cargo requirements (3)(b) using the actual spacing of stiffeners and with H , in metres, measured vertically from a point one third of each plate width from its lower edge to the upper deck at side.

9.2.4 Where the hopper tanks are interconnected with the topside tanks, or in way of ballast holds, the plating is also to comply with the requirements of Table 7.8.1 Strengthening for heavy cargo requirements (3)(c) and (3)(d), whichever is appropriate.

9.3 Sloped bulkhead stiffeners

9.3.1 The scantlings of sloped bulkhead stiffeners are to be as required for inner bottom longitudinals, see Pt 4, Ch 7, 8 Double bottom structure. In ships strengthened for heavy cargoes, the scantlings of the stiffeners are to be derived from Table 7.8.1 Strengthening for heavy cargo requirements using a head for heavy cargo measured vertically from the mid-point of the effective length to the underside of the topside tank sloped bulkhead. Where the hopper tanks are interconnected with the topside tanks, or in way of ballast holds, the scantlings of the stiffeners are also to comply with the requirements of Table 7.8.1 Strengthening for heavy cargo requirements (4)(c) and (4)(d), whichever is appropriate. For higher tensile steel longitudinals the requirements of Pt 4, Ch 1, 6.2 Longitudinal stiffening are to be complied with where applicable, see also Pt 4, Ch 7, 9.7 Structural details.

9.4 Shell and bilge stiffeners

9.4.1 The scantlings of the shell and bilge longitudinals are to comply with the requirements of Pt 4, Ch 1, 6 Shell envelope framing.

9.5 Tank end bulkheads

9.5.1 The scantlings of tank end bulkheads are to comply with the requirements for deep tanks in Table 1.9.1 Watertight and deep tank bulkhead scantlings. Where the hopper tanks are interconnected with the topside tanks, the scantlings are to be derived, using the load head h_4 , in metres, from Table 7.8.1 Strengthening for heavy cargo requirements (3)(c) and (4)(c), as appropriate.

9.6 Primary supporting structure

9.6.1 Transverses supporting longitudinal stiffening are to comply with the requirements of Table 7.9.1 Hopper tank primary structure, and are to be in line with the double bottom floors.

9.7 Structural details

9.7.1 Bracket/diaphragms at the top of the hopper tank are to be of sufficient size and thickness to provide effective rigidity, and care is to be taken to ensure alignment with brackets at the bottom of the side frames in the holds. The shell and sloped bulkhead longitudinals supporting the diaphragms are to be derived using the span taken between transverses, see also Pt 4, Ch 7, 6.2 Transverse stiffening.

Table 7.9.1: Hopper tank primary structure

Item	Modulus, in cm ³	Inertia, in cm ⁴
(1) Bottom and side shell transverses	$Z = 11,71 \rho k S h l_e^2$	$I = \frac{2,5}{k} l_e Z$

(2) Sloped bulkhead transverses	<p>The greater of:</p> <p>(a) $Z = 11,71 \rho k S h_1 l_e^2$</p> <p>(b) $Z = 6,6 \frac{k S H_H l_e^2}{C} \tan$</p>	$I = \frac{2,5}{k} l_e Z$ $I = \frac{1,85}{k} l_e Z$
Symbols		
<p>S, k, l_e = as defined in Pt 4, Ch 7, 1.7 Information required for non-CSR bulk carriers</p> <p>Z, I, ρ</p> <p>h = distance, in metres, from the mid-point of the effective length to the upper deck at side</p> <p>h_1 = the greater of the distance, in metres, from the midpoint of the effective length to the top of the tank or half the distance, in metres, to the top of the overflow, or in way of cargo oil or ballast holds: the distance from the tank top to the deck at centre, or where the hopper tank is interconnected with the topside tank: the load head h_4, as derived from Table 7.8.1 Strengthening for heavy cargo requirements(4)(c), whichever is the greatest</p> <p>C = stowage rate, in m³/tonne, as defined in Table 7.8.1 Strengthening for heavy cargo requirements. For bulk carriers without the notation 'strengthened for heavy cargoes', the value to be used is 1,39 m³/tonne. For bulk carriers with the notation 'strengthened for heavy cargoes', the actual stowage rate is to be used, but the value is not to be taken greater than 0,865 m³/tonne.</p> <p>H_H = distance, in metres, measured vertically from the mid-point of the effective length to the underside of the topside tank sloped bulkhead</p>		

Section 10

Bulkheads

10.1 General

10.1.1 The requirements of Pt 4, Ch 1, 9 Bulkheads are to be applied, together with the requirements of this Section.

10.1.2 Where vertically corrugated transverse watertight bulkheads are fitted, the scantlings and arrangements are also to satisfy the requirements of Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions. Other transverse watertight bulkhead types will be specially considered.

10.1.3 In way of ballast holds, the scantlings are to satisfy the requirements of Table 1.9.1 Watertight and deep tank bulkhead scantlings in Pt 4, Ch 1 General Cargo Ships for deep tanks with the load head, h_4 , in metres, taken to the deck at centre. This includes the scantlings of vertically corrugated and double plate transverse bulkheads supported by stools. In addition, the thickness of corrugations is to be not less than given by Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment for watertight corrugated bulkheads. Alternatively, the scantlings may be based on direct calculations which are to be submitted.

10.1.4 All bulk carriers to be classed '**100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP**' are to be arranged with top and bottom stools. The requirements of Pt 4, Ch 7, 10.2 Bulkheads supported by stools are to be complied with as appropriate.

10.2 Bulkheads supported by stools

10.2.1 The stools are to be reinforced with plate diaphragms or deep webs, and in bottom stools the diaphragms are to be aligned with double bottom side girders. Continuity is also to be maintained between the diaphragms and the bulkhead corrugations for 90° corrugations.

10.2.2 The sloping plate of bottom stools is to be aligned with double bottom floors. Particular attention is to be given to the through thickness properties of the inner bottom plating and continuity at the connection to the inner bottom, and to the through thickness properties of the bottom stool shelf plate, see Ch 3, 8 Plates with specified through thickness properties of the *Rules for*

the Manufacture, Testing and Certification of Materials regarding requirements for plates with specified through thickness properties.

10.2.3 An efficient system of reinforcement is to be arranged in line with the hold transverse bulkheads or bulkhead stools at the intersection with the sloped plating of the hopper and topside tanks. The reinforcement fitted in the tanks is to consist of girders or intercostal bulb plate or equivalent stiffeners fitted between, and connected to, the sloped bulkhead longitudinals.

10.2.4 The shelf plates of the bulkhead stools are to be arranged to align with the longitudinals in the hopper and topside tanks. Where sloping shelf plates are fitted to stools, suitable scarfing is to be arranged in way of the connections of the stools to the adjoining structures.

10.2.5 The *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations in the critical areas of the lower stool and of the upper boundaries.

10.3 Structural details in way of holds confined to dry cargoes

10.3.1 In dry cargo holds where transverse bulkheads are arranged without bottom stools, the stiffeners and brackets of plane bulkheads, and rectangular corrugations of corrugated bulkheads, are to be aligned with floors and inner bottom longitudinals. In the case of non-rectangular corrugations, the flanges are to be aligned with floors, but consideration will be given to the fitting of a substantial transverse girder in place of one of the floors.

10.3.2 Where transverse corrugated bulkheads are arranged without top stools, transverse beams are to be arranged under the deck in way.

10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions

10.4.1 Where corrugated transverse watertight bulkheads are fitted, the scantlings are to be determined in accordance with the following requirements.

10.4.2 For ships of length, L , 190 m or above, the vertically corrugated transverse bulkheads are to be fitted with a bottom stool and, generally, with a top stool below the deck. The requirements of Pt 4, Ch 7, 10.6 Vertically corrugated transverse bulkheads – Support structure at ends are to be complied with as appropriate.

10.4.3 The loads to be considered as acting on the bulkheads are those given by the combination of cargo loads with those induced by the flooding of one hold adjacent to the bulkhead under consideration. The most severe combinations of cargo induced loads and flooding loads are to be used for the determination of the scantlings of each bulkhead, depending on the specified design loading conditions:

- (a) homogeneous loading conditions,
- (b) non-homogeneous loading conditions (excluding part loading conditions associated with multi-port loading and unloading),
- (c) packed cargo conditions (such as steel mill products).

The individual flooding of loaded and empty holds is to be considered, but the pressure used in the assessment is not to be less than that obtained for flood water alone. Holds containing packed cargo are to be treated as empty holds.

10.4.4 The cargo surface is to be taken as horizontal and at a distance d_1 , in metres, from the base line, see Figure 7.10.1 Cargo hold dimensions, where d_1 is calculated taking into account the cargo properties and the hold dimensions. Unless the ship is designed to carry only cargo of bulk density greater than or equal to 1,78 tonne/m³ in non-homogeneous loading conditions, the maximum mass of cargo which may be carried in the hold is to be taken as filling that hold to the upper deck level at centreline. A permeability, μ , of 0,3 and angle of repose, ψ , of 35° is to be assumed for this application.

Figure 7.10.1: Cargo hold dimensions

10.4.5 An homogeneous load condition is defined as one where the ratio between the highest and the lowest filling levels, d_1 , in adjacent holds does not exceed 1,20. For this purpose, where a loading condition includes cargoes of different densities, equivalent filling levels are to be calculated for all holds on the basis of a single reference value of cargo density, which can be the minimum to be carried.

10.4.6 The permeability, μ , may be taken as 0,3 for ore, coal and cement cargoes. The bulk density and angle of repose, ψ , may generally be taken as 3,0 tonne/m³ and 35° respectively for iron ore and 1,3 tonne/m³ and 25° respectively for cement.

10.4.7 The flooding head, h_f , see Figure 7.10.1 Cargo hold dimensions, is the distance, in metres, measured vertically with the ship in the upright position, from the location P , under consideration, to a position d_f , in metres, from the base line as given in Table 7.10.1 Flooding head.

10.4.8 In considering a flooded hold, the total load is to be taken as that of the cargo and flood water at the appropriate permeability. Where there is empty volume above the top of the cargo, this is to be taken as flooded to the level of the flooding head.

10.4.9 Corrugations may be constructed of flanged plates or fabricated from separate flange and web plates, which may be of different thicknesses. The corrugation angle is to be not less than 55°, see Figure 7.10.2 Dimensions of bulkhead corrugation angles.

10.4.10 The term net plate thickness is used to describe the calculated minimum thickness of plating of the web, t_w , or flange, t_f . The plate thickness to be fitted is the net plate thickness plus a corrosion addition of 3,5 mm.

10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment

10.5.1 The bending moment M , in kNm (tonne-f m), for the bulkhead corrugations is given by:

$$M = \frac{Fl}{8}$$

where

l = span of the corrugation, in metres, to be measured between the internal ends of the bulkhead upper and lower stools in way of the neutral axis of the corrugations or, where no stools are fitted, from inner bottom to deck, see Figure 7.10.2 Dimensions of bulkhead corrugation angles and Figure 7.10.3 Scantling assessment. The lower end of the upper stool is not to be taken greater than a distance from the deck at the centreline equal to:

= 3 times the depth of the corrugation, in general, or

= 2 times the depth of the corrugation, for rectangular stools

F = resultant force, in kN (tonne-f), see Table 7.10.3 Resultant pressure and force.

Figure 7.10.2: Dimensions of bulkhead corrugation angles

10.5.2 The shear force, Q , in kN (tonne-f) at the lower end of the bulkhead corrugation is given by:

$$Q = 0,8F$$

where F is defined in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment.

Table 7.10.1: Flooding head

Item	Bulkhead location	Bulk carriers with Type B freeboard and deadweight < 50 000 tonnes	Other bulk carriers
I ⁽¹⁾	Between holds 1 and 2	$d_f = 0,95D$	$d_f = D$
	Elsewhere	$d_f = 0,85D$	$d_f = 0,9D$
II ⁽¹⁾	Between holds 1 and 2	$d_f = 0,9D$	$d_f = 0,95D$
	Elsewhere	$d_f = 0,8D$	$d_f = 0,85D$

Note 1. Item **II** is to be used for non-homogeneous loading conditions where the bulk cargo density is less than 1,78 tonne/m³. Otherwise, Item **I** is to be used.

Note 2. D = distance, in metres, from the base line to the freeboard deck at side amidships, see Fig 7.10.1.

Figure 7.10.3: Scantling assessment

10.5.3 The section modulus of the corrugations is to be calculated using net plate thicknesses. At the lower end, the following requirements apply:

- An effective width of compression flange, b_{ef} , not greater than given in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment, is to be used.
- Where corrugation webs are not supported by local brackets below the shelf plate (or below the inner bottom if no lower stool is fitted), they are to be assumed 30 per cent effective in bending. Otherwise, the full area of web plates may be used, see also Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment.
- Where effective shedder plates are fitted, see Figure 7.10.4 Symmetric shedder plates and Figure 7.10.5 Asymmetric shedder plates, the net area of the corrugation flange plates, in cm², may be increased by the lesser of:

$$2,5b\sqrt{(t_f t_{sh})} \text{ and } 2,5b t_f$$

where

b = width of corrugation flange, in metres, see Figure 7.10.2 Dimensions of bulkhead corrugation angles

t_f = net flange plate thickness, in mm

t_{sh} = net shedder plate thickness, in mm

A shedder plate is considered effective when it:

- is not knuckled; and
 - is welded to the corrugations and the lower stool shelf plate by one-side penetration welds or equivalent; and
 - has a minimum slope of 45° and lower edges in line with the stool side plating; and
 - has a thickness not less than 0,75 times the thickness of the corrugation flanges; and
 - has material properties at least equal to those of the corrugation flanges.
- (d) Where effective gusset plates are fitted, see Figure 7.10.6 Symmetric gusset/shedder plates and Figure 7.10.7 Asymmetric gusset/shedder plates the net area of the corrugation flange plates, in cm², may be increased by:

$$7 h_g t_f$$

where

h_g = height of the gusset plate, in metres, but is not to be taken greater than $\frac{10}{7} s_{gu}$

t_f = net flange plate thickness, in mm

s_{gu} = width of the gusset plate, in metres

A gusset plate is considered effective when it:

- is fitted in combination with an effective shedder plate as defined in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment; and
 - has height not less than half the flange plate width; and
 - is fitted in line with the stool side plating; and
 - has thickness and material properties at least equal to those of the flanges; and
 - is welded to the top of the lower stool by full penetration welds and to the corrugations and shedder plates by one-side penetration welds or equivalent.
- (e) Where the corrugation is welded to a sloping stool shelf plate, set at an angle of not less than 45° to the horizontal, the corrugation webs may be taken as fully effective in bending. Where the slope is less than 45°, the effectiveness is to be assessed by linear interpolation between fully effective at 45° and the appropriate value from Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment at 0°. Where effective gusset plates are also fitted, the area of the flange plates may be increased in accordance with Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment. No increase is permitted in the case where shedder plates are fitted without gussets.

Table 7.10.2: Bulkhead pressure and force

Item	Pressure, kN/m ² (tonne-f/m ²)	Force, kN (tonne-f)
(1) In non-flooded bulk cargo holds	$p_c = g p_c h_1 \tan^2 \theta$ $(p_c = p_c h_1 \tan^2 \theta)$	$F_c = 0,5 p_c g s_1 (d_1 - h_{DB} - h_{LS})^2 \tan^2 \theta$ $(F_c = 0,5 p_c s_1 (d_1 - h_{DB} - h_{LS})^2 \tan^2 \theta)$
(2) In flooded bulk cargo holds, when $d_f \geq d_1$		
(a) For positions between d_1 and d_f from base line	$p_{cf} = g p h_f$ $(p_{cf} = p h_f)$	$F_{cf} = 0,5 s_1 (p g (d_f - d_1)^2 + (p g (d_f - d_1) + p_{fe}) (d_1 - h_{DB} - h_{LS}))$

(b) For positions at a distance lower than d_f from base line	$p_{cf} = g (\rho h_f + (\rho_c - \rho (1-\mu))h_1 \tan^2 \theta)$ $(p_{cf} = (\rho h_f + (\rho_c - \rho (1-\mu))h_1 \tan^2 \theta))$	$(F_{cf} = 0,5s_1(\rho(d_f-d_1)^2 + (\rho(d_f-d_1) + p_{le})(d_1-h_{DB}-h_{LS})))$
(3) In flooded bulk cargo holds, when $d_f < d_1$		
(a) For positions between d_1 and d_f from base line	$p_{cf} = g \rho_c h_1 \tan^2 \theta$ $(p_{cf} = \rho_c h_1 \tan^2 \theta)$	$F_{cf} = 0,5s_1(\rho_c g(d_1-d_f)^2 \tan^2 \theta + (\rho_c g(d_1-d_f) \tan^2 \theta + p_{le})(d_f-h_{DB}-h_{LS}))$
(b) For positions at a distance lower than d_f from base line	$p_{cf} = g(\rho h_f + (\rho_c h_1 - \rho(1-\mu)h_f) \tan^2 \theta)$ $(p_{cf} = (\rho h_f + (\rho_c h_1 - \rho(1-\mu)h_f) \tan^2 \theta))$	$(F_{cf} = 0,5s_1(\rho_c(d_1-d_f)^2 \tan^2 \theta + (\rho_c(d_1-d_f) \tan^2 \theta + p_{le})(d_f-h_{DB}-h_{LS})))$
(4) In flooded empty holds	$p_f = g \rho h_f$ $(p_f = \rho h_f)$	$F_f = 0,5s_1 \rho g(d_f-h_{DB}-h_{LS})^2$ $(F_f = 0,5s_1 \rho(d_f-h_{DB}-h_{LS})^2)$
Symbols		
<p>d_f see Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions</p> <p>d_1 = vertical distance, in metres, from the base line to the top of the cargo, see Figure 7.10.1 Cargo hold dimensions</p> <p>g = gravitational constant, 9,81 m/sec²</p> <p>h_{DB} = height of double bottom, in metres</p> <p>h_f = flooding head, see Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions</p> <p>h_{LS} = mean height of lower stool, in metres</p> <p>h_1 = vertical distance, in metres, from the calculation point to the top of the cargo, see Figure 7.10.1 Cargo hold dimensions</p> <p>p_c, p_{cf}, p_f = pressure on the bulkhead at the point under consideration, in kN/m² (tonne-f/m²)</p> <p>p_{le} = pressure at the lower end of the corrugation, in kN/m² (tonne-f/m²)</p> <p>s_1 = spacing of the corrugations, in metres, see Figure 7.10.2 Dimensions of bulkhead corrugation angles</p> <p>ρ = density of sea water = 1,025 tonne/m³</p> <p>ρ_c = bulk cargo density, in tonne/m³</p> <p>θ = 45° - ($\psi/2$)</p> <p>ψ = angle of repose of the cargo, in degrees</p> <p>μ = permeability of cargo, see Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions</p>		

Table 7.10.3: Resultant pressure and force

Loading condition	Resultant pressure kN/m ² (tonne-f/m ²)	Resultant force kN (tonne-f)
Homogeneous	$p_r = p_{cf} - 0,8p_c$	$F = F_{cf} - 0,8F_c$
Non-homogeneous	$p_r = p_{cf}$	$F = F_{cf}$
Flood water alone (adjacent holds empty)	$p_r = p_f$	$F = F_f$
NOTE		
For symbols, see Table 7.10.2.		

10.5.4 The section modulus of corrugations at cross-sections other than the lower end is to be calculated with fully effective webs and an effective compression flange width, b_{ef} not greater than given in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment.

**Figure 7.10.4: Symmetric shedder plates**

Figure 7.10.5: Asymmetric shedder plates

Figure 7.10.6: Symmetric gusset/shedder plates

10.5.5 The bending capacity of the bulkhead corrugations is to comply with the following relationship:

$$\frac{1000M}{0,5Z_{le}\sigma_{p,le} + Z_m\sigma_{p,m}} \leq 0,95$$

where

M = bending moment, in kNm (tonne-f m), see Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment

Z_{le} = section modulus at the lower end of the corrugations, in cm³

Z_m = section modulus at mid-span of the corrugations, in cm³

$\sigma_{p,le}$ = permissible bending stress at the lower end of the corrugations, in N/mm² (kgf/mm²)

$\sigma_{p,m}$ = permissible bending stress at mid-span of the corrugations, in N/mm² (kgf/mm²)

In the above expression Z_{le} , in cm³, is not to be taken greater than Z'_{le} where

$$Z'_{le} = Z_g + \left(\frac{1000 Q h_g - 0,5 h_g^2 s_1 p_g}{\sigma_{p,le}} \right)$$

and Z_m is not to exceed the lesser of $1,15Z_{le}$ and $1,15Z'_{le}$

where

h_g = height of the gusset plate, in metres

p_g = resultant pressure calculated in way of the middle of the shedder or gusset plates as appropriate, in kN/m² (tonne- f/m²)

s_1 = spacing of the corrugations, in metres

Q = shear force, in kN (tonne-f), see Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment

Z_g = section modulus of the corrugations in way of the upper end of shedder or gusset plates as appropriate, in cm³.

**Figure 7.10.7: Asymmetric gusset/shedder plates**

10.5.6 The applied shear stress, in N/mm² (kgf/mm²), is determined by dividing the shear force derived from Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment by the shear area of the corrugation, calculated using the net plate thickness. The shear area is to be reduced to account for non-perpendicularity between the corrugation webs and flanges. In general, the reduced area may be obtained by multiplying the web sectional area by $\sin \phi$, where ϕ is the angle between the web and the flange, see Figure 7.10.2 Dimensions of bulkhead corrugation angles. The applied shear stress is not to exceed the permissible shear stress or the shear buckling stress given in Table 7.10.4 Permissible shear and buckling stresses.

Table 7.10.4: Permissible shear and buckling stresses

Bending, N/mm ² (kgf/mm ²)	Shear, N/mm ² (kgf/mm ²)	Shear buckling, N/mm ² (kgf/mm ²)
$\sigma_p = \sigma_0$	$\tau_p = 0,5\sigma_0$	$\tau_{cr} = \tau_E$ when $\tau_E \leq \frac{\tau_0}{2}$ $= \tau_0 \left(1 - \frac{\tau_0}{4\tau_E} \right)$ when $\tau_E \leq \frac{\tau_0}{2}$

Symbols
b = width of corrugation flange, in metres, see Figure 7.10.2 Dimensions of bulkhead corrugation angles
c = width of corrugation web, in metres, see Figure 7.10.2 Dimensions of bulkhead corrugation angles
t_f = net flange plate thickness, in mm
t_w = web plate net thickness, in mm
E = modulus of elasticity = 206 000 N/mm ² (21000 kgf/mm ²)
σ_0 = specified minimum yield stress, in N/mm ² (kgf/mm ²)
$\tau_E = 5,706 E (t_w/1000c)^2$ N/mm ² (kgf/mm ²)
$\tau_0 = \frac{\sigma_0}{\sqrt{3}}$ N/mm ² (kgf/mm ²)

10.5.7 The width of the compression flange, in metres, to be used for calculating the effective modulus is:

$$b_{ef} = C_{ef} b$$

where

$$C_{ef} = \frac{2,25}{\beta} - \frac{1,25}{\beta^2} \quad \text{for } \beta > 1,25$$

$$C_{ef} = 1,0 \quad \text{for } \beta \leq 1,25$$

$$\beta = 10^3 \left(\frac{b}{t_f} \right) \sqrt{\frac{\sigma_0}{E}}$$

Other symbols are as defined in Table 7.10.4 Permissible shear and buckling stresses.

10.5.8 The corrugation flange and web local net plate thickness are not to be less than:

$$t = 14,9 s_w \sqrt{1,05 \frac{p_r}{\sigma_0}} \text{ mm}$$

where

s_w = plate width, in metres, to be taken equal to the width of the corrugation flange or web, whichever is the greater

p_r = resultant pressure, in kN/m² (tonne-f/m²), as defined in Table 7.10.3 Resultant pressure and force, at the lower edge of each strake of plating. The net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool, (or at the inner bottom, if no lower stool is fitted), or at the top of the shedders, if effective shedder or gusset and shedder plates are fitted

σ_0 = specified minimum yield stress of the material, in N/mm² (kgf/mm²).

10.5.9 For built-up corrugations, where the thickness of the flange and of the web are different, the net thickness of the narrower plating is to be not less than:

$$t_n = 14,9 s_n \sqrt{1,05 \frac{p_r}{\sigma_0}} \text{ mm}$$

where

s_n = width of the narrower plating, in metres.

The net thickness, in mm, of the wider plating is not to be taken less than the greater of:

$$t_{wp} = 14,9s_w \sqrt{1,05 \frac{p_r}{\sigma_0}} \text{ mm or}$$

$$t_{wp} = \sqrt{\frac{462s_w^2 p_r}{\sigma_0} - t_{np}^2} \text{ mm}$$

where

$t_{np} \leq$ actual net thickness of the narrower plating but not greater than:

$$14,9s_w \sqrt{1,05 \frac{p_r}{\sigma_0}} \text{ mm}$$

10.5.10 The required thickness of plating is the net thickness plus the corrosion addition given in Pt 4, Ch 7, 10.4 Vertically corrugated transverse watertight bulkheads – Application and definitions.

10.5.11 Scantlings required to meet the bending and shear strength requirements at the lower end of the bulkhead corrugation are to be maintained for a distance of $0,15l$ from the lower end, where l is as defined in Pt 4, Ch 7, 10.5 Vertically corrugated transverse watertight bulkheads – Scantling assessment. Scantlings required to meet the bending requirements at mid-height are to be maintained to a location no greater than $0,3l$ from the top of the corrugation. The section modulus of the remaining upper part of the corrugation is to be not less than $0,75$ times that required for the middle part, corrected for differences in yield stress.

10.6 Vertically corrugated transverse bulkheads – Support structure at ends

10.6.1 The requirements of Pt 4, Ch 7, 10.2 Bulkheads supported by stools are to be complied with as applicable, together with the following.

10.6.2 Lower stool:

- (a) The height of the lower stool is generally to be not less than three times the depth of the corrugations.
- (b) The thickness and steel grade of the stool shelf plate are to be not less than those required for the bulkhead plating above.
- (c) The thickness and steel grade of the upper portion of vertical or sloping stool side plating, within the depth equal to the corrugation flange width from the stool top, are to be not less than the flange plate thickness and steel grade needed to meet the bulkhead requirements at the lower end of the corrugation.
- (d) The thickness of the stool side plating and the section modulus of the stool side stiffeners are to be not less than those required by Pt 4, Ch 1, 9 Bulkheads for a plane transverse bulkhead and stiffeners using the greater of the pressures determined from the head, h_4 , in Table 1.9.1 Watertight and deep tank bulkhead scantlings and the expressions given in Table 7.10.2 Bulkhead pressure and force.
- (e) The ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool.
- (f) The width of the shelf plate is to be in accordance with Figure 7.10.8 Width of shelf plate.
- (g) The stool bottom is to have a width not less than $2,5$ times the mean depth of the corrugation.
- (h) Scallops in the brackets and diaphragms in way of connections to the stool shelf plate are to be avoided.
- (i) Where corrugations are terminated on the bottom stool, corrugations are to be connected to the stool top plate by full penetration welds. The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or partial penetration welds, see Figure 7.10.9 Partial penetration welding. The supporting floors are to be connected to the inner bottom by either full penetration or partial penetration welds.

10.6.3 Upper stool:

- (a) The upper stool, where fitted, is to have a height generally between two and three times the depth of corrugations.
- (b) Rectangular stools are to have a height generally equal to twice the depth of corrugations, measured from the deck level and at hatch side girder.
- (c) The upper stool is to be properly supported by girders or deep brackets between the adjacent hatch-end beams.
- (d) The width of the shelf plate is generally to be the same as that of the lower stool shelf plate.
- (e) The upper end of a non-rectangular stool is to have a width not less than twice the depth of corrugations.
- (f) The thickness and steel grade of the shelf plate are to be the same as those of the bulkhead plating below.
- (g) The thickness of the lower portion of stool side plating is to be not less than 80 per cent of that required for the upper part of the bulkhead plating where the same materials are used.
- (h) The thickness of the stool side plating and the section modulus of the stool side stiffeners are to be not less than those required by Ch 1,9 for plane transverse bulkheads and stiffeners using the greater of the pressures determined from the head, h_4 , in Table 1.9.1 Watertight and deep tank bulkhead scantlings and the expressions given in Table 7.10.2 Bulkhead pressure and force.
- (i) Where vertical stiffening is fitted, the ends of stool side stiffeners are to be attached to brackets at the upper and lower end of the stool.
- (j) Diaphragms are to be fitted inside the stool, in line with, and effectively attached to, longitudinal deck girders extending to the hatch end coaming girders for effective support of the corrugated bulkhead.
- (k) Scallops in the brackets and diaphragms in way of the connection to the stool shelf plate are to be avoided.

10.6.4 If no upper stool is fitted, two transverse reinforced beams are to be fitted in line with the corrugation flanges.

10.6.5 If no bottom stool is fitted, the corrugation flanges are to be in line with the supporting floors. Corrugations are to be connected to the inner bottom plating by full penetration welds. The thickness and steel grades of the supporting floors are to be at least equal to those provided for the corrugation flanges. The plating of supporting floors is to be connected to the inner bottom by either full penetration or deep penetration welds, see Figure 7.10.9 Partial penetration welding. The cut-outs for connections of the inner bottom longitudinals to double bottom floors are to be closed by collar plates. The supporting floors are to be connected to each other by suitably designed shear plates.

10.6.6 Stool side plating is to align with the corrugation flanges. Stool side vertical stiffeners and their brackets in the lower stool are to align with the inner bottom longitudinals to provide appropriate load transmission between these stiffening members. The lower stool side plating is not to be knuckled.

10.6.7 The design of local details is to take into account the transfer of the bulkhead forces and moments to the boundary structures and particularly to the double bottom and cross-deck structures.

■ Section 11 Direct calculation

11.1 Application

11.1.1 Direct calculations are to be employed in derivation of scantlings where required by the preceding Sections of this Chapter or by related provisions included in Pt 3 Ship Structures (General).

11.1.2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

11.2 Procedures

11.2.1 For details of LR's direct calculation procedures see Pt 3, Ch 1, 2 Direct calculations. For requirements concerning use of other calculation procedures, see Pt 3, Ch 1, 3 Equivalents.

■ Section 12

Steel hatch covers

12.1 General

12.1.1 These requirements apply to hatch covers on exposed decks in Position 1, see Pt 3, Ch 1, 6.5 Position 1 and Position 2, and are in addition to the following requirements:

- (a) Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed, and Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed.
- (b) Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed for the vertical weather pressure load case and cargo load, if carried on the hatch covers.

Note When cargo is carried on the hatch covers, Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed to Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed are also to be complied with. Cargo loads are to be in accordance with Pt 3, Ch 11, 2.3 Load model and Pt 3, Ch 11, 2.3 Load model. Pt 4, Ch 8, 11.2 Direct calculations is to be considered for compliance with Pt 3, Ch 11, 2.4 Allowable stress and deflection, Pt 3, Ch 11, 2.4 Allowable stress and deflection, Pt 3, Ch 11, 2.5 Local net plate thickness, Pt 3, Ch 11, 2.8 Net scantling of secondary stiffeners, Pt 3, Ch 11, 2.8 Net scantling of secondary stiffeners, Pt 3, Ch 11, 2.9 Net scantling of primary supporting members and Pt 3, Ch 11, 2.9 Net scantling of primary supporting members. The vertical weather design load needs not to be combined with the cargo load.

- (c) For hatch covers subject to wheel loading or helicopter landing, Pt 3, Ch 9, 3 Decks loaded by wheeled vehicles and Pt 3, Ch 9, 5 Helicopter landing areas are to be complied with.

12.1.2 The net plate thickness, t_{net} , is the calculated minimum thickness of the plating and stiffeners. The required thickness is the net thickness plus a corrosion addition, t_c , given in Table 7.12.1 Corrosion addition t_c .

Table 7.12.1: Corrosion addition t_c

Hatch cover type		t_c , in mm
(a)	Single skin	2,0
(b)	Pontoon (double skin)	
	(i) for the top and bottom plating	2,0
	(ii) for the internal structures	1,5

12.1.3 Material for the hatch covers is to be steel according to the requirements for ship's hull.

12.2 Stiffener arrangement

12.2.1 The secondary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

12.2.2 The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed $\frac{1}{3}$ of the span of primary supporting members.

12.3 Closing arrangements

12.3.1 Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

12.3.2 Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

12.3.3 The net sectional area of each securing device is not to be less than:

$$A = 1,4 a/f \text{ cm}^2$$

where

a = spacing in m of securing devices, not being taken less than 2 m

$$f = (\sigma_Y/235)^e$$

σ_Y = specified minimum upper yield stress in N/mm² of the steel used for fabrication, not to be taken greater than 70 per cent of the ultimate tensile strength

$$e = 0,75 \text{ for } \sigma_Y > 235$$

$$= 1,0 \text{ for } \sigma_Y \leq 235$$

12.3.4 Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m² in area.

12.3.5 Between cover and coaming and at cross-joints, a packing line force sufficient to obtain weathertightness is to be maintained by the securing devices. For packing line forces exceeding 5 N/mm, the cross section area is to be increased in direct proportion. The packing line force is to be specified.

12.3.6 The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, I , of edge elements is not to be less than:

$$I = 6p a^4 \text{ cm}^4$$

where

p = packing line pressure in N/mm, minimum 5 N/mm

a = spacing in m of securing devices.

12.3.7 Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

12.3.8 Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

12.3.9 Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

12.3.10 Hatch covers are to be effectively secured, by means of stoppers, against transverse and longitudinal forces (acting on the forward end) arising from a pressure of 175 kN/m².

12.3.11 The equivalent stress:

- in stoppers and their supporting structures; and
- calculated in the throat of the stopper welds; is not to exceed the allowable value of $0,8\sigma_Y$.

12.4 Load model

12.4.1 The pressure, p , in kN/m², acting on the hatch covers is given by:

- (a) For ships of length 100 m or greater, for hatchways located on the freeboard deck, p is to be the greater of 34,3 or the following:

$$p = 34,3 + \frac{p_{FP} - 34,3}{0,25} \left(0,25 - \frac{x}{L} \right)$$

Where a hatchway is located in position 1 and at least one superstructure standard height higher than the freeboard deck, the pressure p may be 34,3 kN/m².

- (b) For ships less than 100 m in length, for hatchways located at the freeboard deck, p is to be the greater of $0,195L + 14,9$ or the following:

$$p = 15,8 + \frac{L}{3} \left(1 - \frac{5}{3} \frac{x}{L} \right) - 3,6 \frac{x}{L}$$

Where two or more panels are connected by hinges, each individual panel is to be considered separately.

where

p_{FP} = pressure at the forward perpendicular

$$= 49,1 + (L - 100) a$$

a = 0,0726 for type B freeboard ships

= 0,356 for ships with reduced freeboard

L = Freeboard length, in metres, as defined in Regulation 3 of Annex I to the 1966 Load Line Convention as modified by the Protocol of 1988, to be taken not greater than 340 m

x = distance, in metres, of the mid length of the hatch cover under examination from the forward end of L .

- (c) For weather deck covers for holds which may be flooded and used as ballast tanks and holds in OBO, ore or oil and similar types of ship, the pressure p , in kN/m², due to the internal load for a member and position under consideration is to be taken as:

$$p = 5,53Y \sin q \text{ kN/m}^2$$

where

$$\sin q = \left(0,45 + \frac{L}{10B}\right) \left(0,54 - \frac{L}{1270}\right)$$

q = roll angle, in degrees, but need not exceed 25° and is not to be taken as less than 22°

Y = transverse distance, in metres, from the side coaming at the coaming top to the member and position under consideration. Both sides of roll are to be considered.

In way of holds for oil cargo, a load equivalent to the inert gas pressure is to be applied over the full breadth of the cover and added to the load corresponding to the liquid pressure. However, where the rolling angle has been determined by direct calculations, the load may be derived accordingly.

12.5 Allowable stress

12.5.1 The normal and shear stresses calculated for the net section hatch cover structures are not to exceed the values given in Table 7.12.2 Permissible stresses.

Table 7.12.2: Permissible stresses

Failure mode	Permissible stress, in N/mm ² (kgf/mm ²)	
Bending	σ_a	= 0,80 σ_F
Shear	τ_a	= 0,46 σ_F
Symbols		
σ_F = minimum upper yield stress, in N/mm ² (kgf/mm ²)		

12.5.2 The normal stress in compression of the attached flange of primary supporting members is not to exceed 0,8 times the critical buckling stress of the structure according to the buckling check as given in Pt 4, Ch 7, 12.10 Hatch cover plating, Pt 4, Ch 7, 12.11 Hatch cover secondary stiffeners and Pt 4, Ch 7, 12.12 Web panels of hatch cover primary supporting members.

12.5.3 The stresses in hatch covers that are designed as a grillage of longitudinal and transverse primary supporting members are to be determined by a grillage or a FE analysis. When such an analysis is used the secondary stiffeners are not to be included in the attached flange area of the primary members.

12.5.4 When calculating the stresses σ and τ as defined in Table 7.12.2 Permissible stresses, the net scantlings are to be used.

12.6 Effective cross-sectional area of panel flanges for primary supporting members

12.6.1 The effective flange area, A_f , in cm^2 , of the attached plating, to be considered for the yielding and buckling checks of primary supporting members, when calculated by means of a beam or grillage model, is obtained as the sum of the effective flange areas of each side of the girder web as appropriate:

$$A_f = \sum_{nf} (10b_{ef}t)$$

where

nf = 2 if attached plate flange extends on both sides of girder web

= 1 if attached plate flange extends on one side of girder web only

t = net thickness of considered attached plate, in mm

b_{ef} = effective breadth of attached plate flange on each side of girder web, in metres

= b_p , but not to be taken greater than $0,165 \times$

b_p = half distance between the considered primary supporting member and the adjacent one, in metres

l = span of primary supporting members, in metres.

12.7 Local net plate thickness

12.7.1 The local net plate thickness of the hatch cover top plating is to be not less than:

$$t = F_p 15,8 s \sqrt{\frac{p}{0,95 \sigma_F}}$$

or 1 per cent of the spacing of the stiffeners or 6 mm, whichever is greater

where

F_p = factor for combined membrane and bending response

= 1,50 in general

= $1,90\sigma/\sigma_a$, where $\sigma/\sigma_a \geq 0,8$, for the attached plate flange of primary supporting members

s = stiffener spacing, in metres

p = pressure, in kN/m^2 , as defined in Pt 4, Ch 7, 12.4 Load model

σ = as defined in Pt 4, Ch 7, 12.9 Net scantlings of primary supporting members

σ_a = as defined in Pt 4, Ch 7, 12.5 Allowable stress.

12.7.2 For double skin hatch covers, when the lower plating is taken into account as a strength member of the hatch cover, the local net plate thickness of the hatch cover bottom plating is to be not less than:

$$t = 6,5s \text{ mm, or}$$

$$t = 5,0 \text{ mm, whichever is the greater}$$

where

s = stiffener spacing, in metres.

12.8 Net scantlings of secondary stiffeners

12.8.1 The required minimum section modulus, Z , in cm^3 , of secondary stiffeners of the hatch cover top plate, based on stiffener net member thickness, is given by:

$$Z = \frac{1000l^2 s p}{12 \sigma_a}$$

where

l = secondary stiffener span, in metres, to be taken as the spacing, in metres, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all secondary stiffener spans, the secondary stiffener span may be reduced by an amount equal to $\frac{2}{3}$ of the minimum bracket arm length, but not greater than 10 per cent of the gross span, for each bracket

s = secondary stiffener spacing, in metres

p = pressure, in kN/m², as defined in Pt 4, Ch 7, 12.4 Load model

σ_a = as defined in Pt 4, Ch 7, 12.5 Allowable stress.

12.8.2 The net section modulus of the secondary stiffeners is to be determined based on an attached plate width assumed equal to the stiffener spacing.

12.9 Net scantlings of primary supporting members

12.9.1 The section modulus and web thickness of primary supporting members, based on member net thickness, are to be such that the normal stress σ in both flanges and the shear stress τ , in the web, do not exceed the allowable values σ_a and τ_a , respectively, defined in Pt 4, Ch 7, 12.5 Allowable stress.

12.9.2 The breadth of the primary supporting member flange is to be not less than 40 per cent of their depth for laterally unsupported spans greater than 3,0 m. Tripping brackets attached to the flange may be considered as a lateral support for primary supporting members.

12.9.3 The flange outstand is not to exceed 15 times the flange thickness.

12.10 Hatch cover plating

12.10.1 The compressive stress, σ , in N/mm², in the hatch cover plate panels, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0,8 times the critical buckling stress σ_{C1} , to be evaluated as defined below:

$$\begin{aligned}\sigma_{C1} &= \sigma_{E1} && \text{when } \sigma_{E1} \leq \sigma_F/2 \\ &= \sigma_F [1 - \sigma_F/(4\sigma_{E1})] && \text{when } \sigma_{E1} > \sigma_F/2\end{aligned}$$

where

σ_F = minimum upper yield stress, in N/mm², of the material

$$\sigma_{E1} = 3,6 E \left(\frac{t}{1000 s} \right)^2$$

E = modulus of elasticity, in N/mm²

= 2,06 x 10⁵ for steel

t = net thickness, in mm, of plate panel

s = spacing of secondary stiffeners, in metres

12.10.2 The mean compressive stress σ in each of the hatch cover plate panels, induced by the bending of primary supporting members perpendicular to the direction of secondary stiffeners, is not to exceed 0,8 times the critical buckling stress σ_{C2} , to be evaluated as defined below:

$$\begin{aligned}\sigma_{C2} &= \sigma_{E2} && \text{when } \sigma_{E2} \leq \sigma_F/2 \\ &= \sigma_F [1 - \sigma_F/(4\sigma_{E2})] && \text{when } \sigma_{E2} > \sigma_F/2\end{aligned}$$

where

σ_F = minimum upper yield stress, in N/mm², of the material

$$\sigma_{E2} = 0,9m E \left(\frac{t}{1000s_s} \right)^2$$

$$m = c \left[1 + \left(\frac{s_s}{l_s} \right)^2 \right]^2 \frac{2,1}{\psi + 1,1}$$

E = modulus of elasticity, in N/mm²

= 2,06 × 10⁵ for steel

t = net thickness of plate panel, in mm

s_s = length of the shorter side of the plate panel, in metres

l_s = length of the longer side of the plate panel, in metres

Ψ = ratio between smallest and largest compressive stress

c = 1,3 when plating is stiffened by primary supporting members

= 1,21 when plating is stiffened by secondary stiffeners of angle or T type

= 1,1 when plating is stiffened by secondary stiffeners of bulb type

= 1,05 when plating is stiffened by flat bar.

12.10.3 The biaxial compressive stress in the hatch cover panels, when calculated by means of FEM shell element model, is to comply with Pt 3, Ch 11, 2.11 Buckling strength of hatch cover structures, using $S = 1,25$.

12.11 Hatch cover secondary stiffeners

12.11.1 The compressive stress σ , in N/mm², in the top flange of secondary stiffeners, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0,8 times the critical buckling stress σ_{CS} , to be evaluated as defined below:

$$\begin{aligned} \sigma_{CS} &= \sigma_{ES} && \text{when } \sigma_{ES} \leq \sigma_F/2 \\ &= \sigma_F [1 - \sigma_F/(4\sigma_{ES})] && \text{when } \sigma_{ES} > \sigma_F/2 \end{aligned}$$

where

σ_F = minimum upper yield stress, in N/mm², of the material

σ_{ES} = ideal elastic buckling stress, in N/mm², of the secondary stiffener

= minimum between σ_{E3} and σ_{E4}

$$\sigma_{E3} = 0,001E I_a / (A l^2)$$

E = modulus of elasticity, in N/mm²

= 2,06 × 10⁵ for steel

I_a = moment of inertia of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners, in cm⁴

A = cross-sectional area of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners, in cm²

l = span of the secondary stiffener, in metres

$$\sigma_{E4} = \frac{\pi^2 E I_w}{10^4 I_p l^2} \left(m^2 + \frac{K}{m^2} \right) + 0,385 E \frac{I_t}{I_p}$$

where

$$K = \frac{C l^4}{\pi^4 E I_w} 10^6 \quad m$$

m = number of half waves, given in Table 7.12.3 Number of half waves

I_w = sectorial moment of inertia (warping constant) of the secondary stiffener about its connection with the plating, in cm^6

$$= \frac{h_w^3 t_w^3}{36} 10^{-6} \text{ for flat bar secondary stiffeners}$$

$$= \frac{t_f b_f^3 h_w^2}{12} 10^{-6} \text{ 'Tee' secondary stiffeners}$$

$$= \frac{b_f h_w^2}{12(b_f + h_w)^2} [t_f(b_f^2 + 2b_f h_w + 4h_w^2) + 3t_w b_f h_w] 10^{-6}$$

= for angles and bulb secondary stiffeners

I_p = polar moment of inertia of the secondary stiffener about its connection with the plating, in cm^4

$$= \frac{h_w^3 t_w}{3} 10^{-4} \text{ for flat bar secondary stiffeners}$$

$$= \left(\frac{h_w^3 t_w}{3} + h_w^2 b_f t_f \right) 10^{-4}$$

= for flanged secondary stiffeners

I_t = St.Venant's moment of inertia of the secondary stiffener without top flange, in cm^4

$$= \frac{h_w^3 t_w}{3} 10^{-4} \text{ for flat secondary stiffeners}$$

$$= \frac{1}{3} \left[h_w t_w^3 + b_f t_f^3 \left(1 - 0,63 \frac{t_f}{b_f} \right) \right] 10^{-4}$$

= for flanged secondary stiffeners

h_w, t_w = height and net thickness of the secondary stiffener, respectively, in mm

b_f, t_f = width and net thickness of the secondary stiffener bottom flange, respectively, in mm

s = spacing of secondary stiffeners, in metres

C = spring stiffness exerted by the hatch cover top plating

$$= \frac{k_p E t_p^3}{3s \left[1 + \frac{1,33 k_p h_w t_p^3}{1000 s t_w^3} \right]} 10^{-3}$$

k_p = $1 - \eta_p$ to be taken not less than zero; for flanged secondary stiffeners, k_p need not be taken less than 0,1

$$\eta_p = \frac{\sigma}{\sigma_{E1}}$$

σ = as defined in Pt 4, Ch 7, 12.9 Net scantlings of primary supporting members

σ_{E1} = as defined in Pt 4, Ch 7, 12.10 Hatch cover plating

t_p = net thickness of the hatch cover plate panel, in mm.

Table 7.12.3: Number of half waves

K	m
$0 < K < 4$	1
$4 < K < 36$	2
$36 < K < 144$	3
$(m - 1)^2 m^2 < K \leq m^2 (m + 1)^2$	m

12.11.2 For flat bar secondary stiffeners and buckling stiffeners, the ratio h/t_w is to be not greater than $15k^{0.5}$

where

h, t_w = height and net thickness of the stiffener, respectively

$$k = 235/\sigma_F$$

σ_F = minimum upper yield stress, in N/mm², of the material.

12.12 Web panels of hatch cover primary supporting members

12.12.1 This check is to be carried out for the web panels of primary supporting members formed by web stiffeners or by the crossing with other primary supporting members, the face plate (or the bottom cover plate) or the attached top cover plate.

12.12.2 The shear stress τ in the hatch cover primary supporting members web panels is not to exceed 0,8 times the critical buckling stress τ_C , to be evaluated as defined below:

$$\begin{aligned} \tau_C &= \tau_E && \text{when } \tau_E \leq \tau_F/2 \\ &= \tau_F [1 - \tau_F/(4\tau_E)] && \text{when } \tau_E > \tau_F/2 \end{aligned}$$

where

σ_F = minimum upper yield stress of the material, in N/mm²

$$\tau_F = \frac{\sigma_F}{\sqrt{3}}$$

$$\tau_E = 0,9k_t E \left(\frac{t_{pr,n}}{1000d} \right)^2$$

E = modulus of elasticity, in N/mm²

$$= 2,06 \times 10^5 \text{ for steel}$$

$t_{pr,n}$ = net thickness of primary supporting member, in mm

$$k_t = 5,35 + 4,0/(a/d)^2$$

a = greater dimension of web panel of primary supporting member, in metres

d = smaller dimension of web panel of primary supporting member, in metres.

12.12.3 For primary supporting members parallel to the direction of secondary stiffeners, the actual dimensions of the panels are to be considered.

12.12.4 For primary supporting members perpendicular to the direction of secondary stiffeners or for hatch covers built without secondary stiffeners, a presumed square panel of dimension d is to be taken for the determination of the stress τ_C . In such a case, the average shear stress τ between the values calculated at the ends of this panel is to be considered.

12.13 Deflection limit and connections between hatch cover panel

12.13.1 Load bearing connections between the hatch cover panels are to be fitted with the purpose of restricting the relative vertical displacements.

12.13.2 The vertical deflection of primary supporting members is to be not more than $0,0056l$, where l is the greatest span of primary supporting members.

■ **Section 13**
Hatch coamings

13.1 General

13.1.1 The height and construction of forward and side hatch coamings are to comply with the following requirements. All hatch coamings are to comply with the requirements of Pt 3, Ch 11, 5.1 General, Pt 3, Ch 11, 5.1 General, Pt 3, Ch 11, 5.2 Construction, Pt 3, Ch 11, 5.2 Construction, Pt 3, Ch 11, 5.2 Construction to Pt 3, Ch 11, 5.2 Construction, Pt 3, Ch 11, 5.2 Construction to Pt 3, Ch 11, 5.2 Construction and Pt 3, Ch 11, 5.4 Rest bars in hatchways.

13.1.2 For the structure of hatch coamings and coaming stays, the corrosion addition t_c is to be 1,5 mm.

13.1.3 Material for the hatch coamings is to be steel according to the requirements for the ship's hull.

13.1.4 The secondary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

13.2 Load model

13.2.1 The pressure p_{coam} on hatch coamings is to be taken as 220 kN/m².

13.3 Local net plate thickness

13.3.1 The local net plate thickness, t , in mm, of the hatch coaming plating is to be the greater of 9,5 mm or the following:

$$t = 14,9s \sqrt{\frac{p_{\text{coam}}}{\sigma_{a, \text{coam}}}} S_{\text{coam}}$$

where

s = secondary stiffener spacing, in metres

P_{coam} = pressure, in kN/m², as defined in Pt 4, Ch 7, 13.2 Load model

S_{coam} = safety factor to be taken equal to 1,15

$\sigma_{a, \text{coam}}$ = $0,95\sigma_F$.

σ_F = minimum upper yield stress, in N/mm², of the material.

13.4 Net scantlings of longitudinal and transverse secondary stiffeners

13.4.1 The required section modulus, Z , in cm³, of the longitudinal or transverse secondary stiffeners of the hatch coamings, based on net member thickness, is given by:

$$Z = \frac{1000S_{\text{coam}} l^2 s p_{\text{coam}}}{m c_p \sigma_{a, \text{coam}}}$$

where

m = 16 in general

= 12 for the end spans of stiffeners sniped at the coaming corners

S_{coam} = safety factor to be taken equal to 1,15

where

l = span of secondary stiffeners, in metres

s = spacing of secondary stiffeners, in metres

p_{coam} = pressure in kN/m² as defined in Pt 4, Ch 7, 13.2 Load model

c_p = ratio of the plastic section modulus to the elastic section modulus of the secondary stiffeners with an attached plate breadth equal to $40t$, where t is the plate net thickness, in mm

= 1,16 in the absence of more precise evaluation

$\sigma_{a,\text{coam}}$ = $0,95\sigma_F$

σ_F = minimum upper yield stress, in N/mm², of the material.

13.5 Net scantlings of coaming stays

13.5.1 The required minimum section modulus, Z , in cm³, and web thickness, t_w , in mm of coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (see Figure 7.13.1 Typical coaming stays, Type A and B) at their connection with the deck, based on member net thickness, are given by:

$$Z = \frac{1000H_c^2 s p_{\text{coam}}}{2 \sigma_{a,\text{coam}}}$$

$$t_w = \frac{1000H_c s p_{\text{coam}}}{h \tau_{a,\text{coam}}}$$

where

H_C = stay height, in metres

s = stay spacing, in metres

h = stay depth at the connection with the deck, in mm

p_{coam} = pressure, in kN/m², as defined in Pt 4, Ch 7, 13.2 Load model

$\sigma_{a,\text{coam}}$ = $0,95\sigma_F$

$t_{a,\text{coam}}$ = $0,5\sigma_F$

σ_F = minimum upper yield stress, in N/mm², of the material.

13.5.2 For calculating the section modulus of coaming stays, their face plate area is to be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it.

13.5.3 For other designs of coaming stays, such as those shown in Figure 7.13.1 Typical coaming stays Type C and D, the stress levels in 12.5 apply and are to be checked at the highest stressed locations.

13.6 Local details

13.6.1 The design of local details is to comply with Pt 3, Ch 11, 5 Hatch coamings for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below. Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

13.6.2 Underdeck structures are to be checked against the load transmitted by the stays, adopting the same allowable stresses specified in Pt 4, Ch 7, 13.5 Net scantlings of coaming stays.

13.6.3 Double continuous welding is to be adopted for the connections of stay webs with deck plating and the weld throat is to be not less than $0,44t_w$, where t_w is the gross thickness of the stay web.

13.6.4 Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15 per cent of the stay width.

Section 14 Forecastles

14.1 Arrangement

14.1.1 An enclosed forecastle is to be fitted on the freeboard deck.

14.1.2 The aft bulkhead of the forecastle is to be fitted in way or aft of the forward bulkhead in the foremost cargo hold. See Figure 7.14.1 Forecastle arrangement. However, if this requirement hinders hatch cover operation, the aft bulkhead of the forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7 per cent of ship length abaft the forward perpendicular where the ship length and forward perpendicular are defined in the *International Convention on Load Lines 1966* and its Protocol of 1988.

Figure 7.14.1: Forecastle arrangement

14.1.3 The forecastle height H_F , in metres, above the main deck is to be not less than the greater of:

- the standard height of a superstructure as specified in the *International Convention on Load Lines 1966 and its Protocol of 1988* ; or
- $H_C + 0,5$ m

where

H_C = the height, in metres, of the forward transverse hatch coaming of cargo hold No.1.

14.1.4 All points of the aft edge of the forecastle deck are to be located at a distance:

$$l_f < 5\sqrt{(H_F - H_C)}$$

from the hatch coaming, see Figure 7.14.1 Forecastle arrangement.

14.1.5 A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centre line is not less than:

$$H_B / \tan 20^\circ$$

forward of the aft edge of the forecastle deck.

where

H_B = the height, in metres, of the breakwater above the forecastle, see Figure 7.14.1 Forecastle arrangement.

14.2 Construction

14.2.1 The construction of the forecastle is to comply with the requirements of Pt 3, Ch 8, 4 Forecastles.

Container Ships

- 15 **Requirements for ships with large deck openings**

■ Section 1 General

1.1 Application and definitions

1.1.1 A **container ship** is defined as a ship designed exclusively for the carriage of containers in holds and on deck. Containers in holds are normally stowed within cellular guide systems.

1.1.2 The term 'narrow side structures' applies where the breadth of hatch opening exceeds 90 per cent of the breadth of the ship.

1.1.3 Other terms used to describe the various structural components of container ships are generally indicated in Lloyd's Register's (hereinafter referred to as 'LR') ShipRight FDA Procedure, *Structural Detail Design Guide*.

1.1.4 Scantlings and arrangements of container ships are to be as required by Pt 4, Ch 1 General Cargo Ships, except as otherwise indicated in this Chapter.

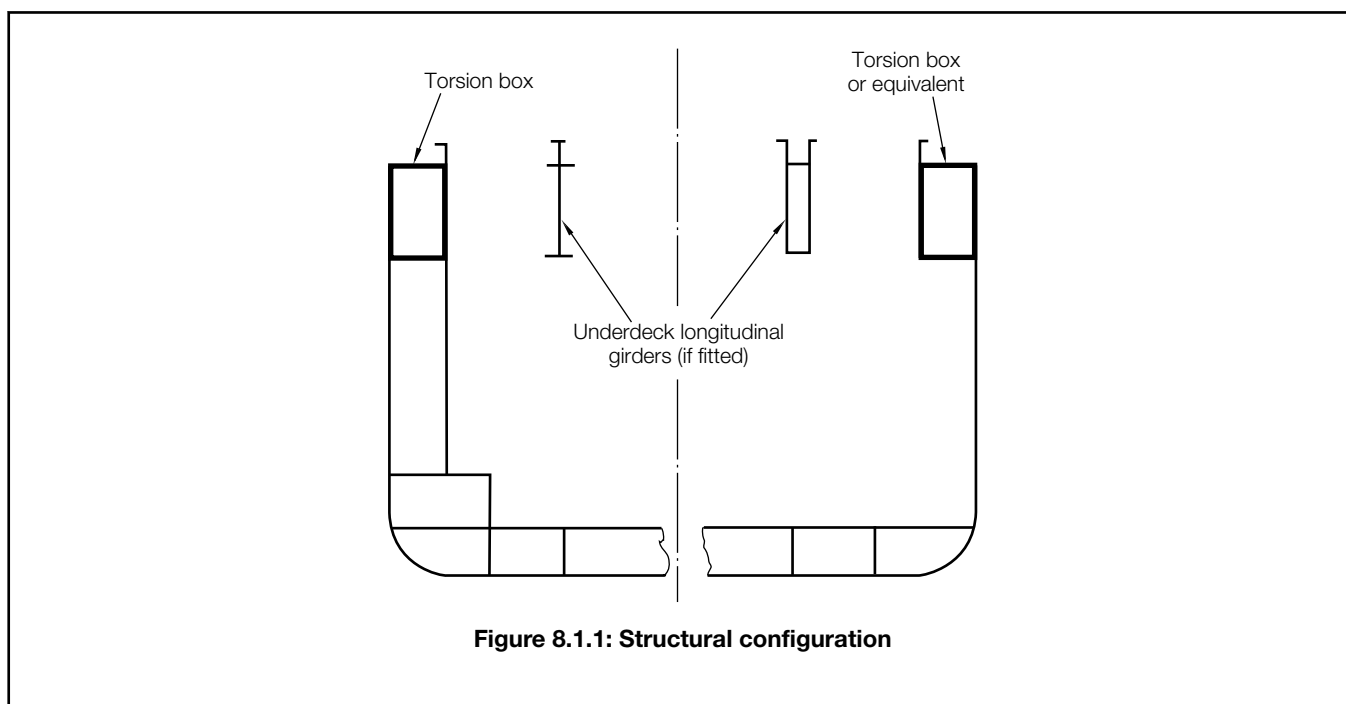

Figure 8.1.1: Structural configuration

1.2 Structural configuration

1.2.1 Figure 8.1.1 Structural configuration shows the typical structural configuration of a container ship covered by the requirements of this Chapter. The typical configuration includes:

- (a) An efficient torsion box girder or equivalent structure at the topsides comprising strength deck, side shell, inner skin and a second deck. The space within the torsion box is often utilised as an underdeck access passageway.
- (b) Single or double skin side construction with or without bilge box.
- (c) Double bottom.
- (d) Continuous or discontinuous hatch coamings.
- (e) Optional continuous deck girders to support hatch covers.

1.2.2 For container ships which do not conform to the above configuration, the application of this Chapter will be specially considered

1.3 Class notations

1.3.1 In general, ships complying with the requirements of this Chapter will be eligible to be classed **100A1 Container Ship**.

1.3.2 LR 'ShipRight Procedures' for the hull construction of ships are detailed in Pt 3, Ch 16 ShipRight Procedures for the Design, Construction and Lifetime Care of Ships and the associated notations and descriptive notes are given in Pt 1, Ch 2, 2.2 Character symbols.

1.3.3 The ShipRight notation **SDA** (Structural Design Assessment) and subsequently **CM** (Construction Monitoring) are mandatory for container ships with a beam greater than 32 m or where the type, size and structural configuration demand, including container ships with narrow side structures, abnormal hull form or unusual structural configuration or complexity.

1.3.4 For large container ships, the effects of whipping and springing on the structural integrity are to be addressed. The ShipRight notations **WDA** (Whipping Design Assessment) and **FDA SPR** (Springing Fatigue Assessment) are mandatory for ships that meet the application criteria specified in Pt 4, Ch 8, 14.3 Procedures for verification of structural response due to whipping, springing and fatigue, see also Table 8.14.1 Summary of direct calculation analysis requirements for container ships.

1.3.5 The ShipRight notations **SDA**, **FDA**, **FDA SPR**, **WDA** may be applied on a voluntary basis. In which case all the requirements of the relevant procedures and supporting procedures are to be applied.

1.4 Information required

1.4.1 In addition to the information and plans required by Pt 3, Ch 1, 5 Information required, the following are to be submitted:

- (a) Details of overlap arrangement of steps in decks and longitudinal bulkheads.
- (b) Details of outline stowage arrangement of containers.
- (c) Details of design container stack weights.
- (d) Details of cell guides and supporting structure indicating the position of guides relative to hatch corners, and attachment to structural members.
- (e) Details of reinforcement to structure in way of container corners/supports.
- (f) Details of reinforcement to structure in way of lashing bridges where fitted.
- (g) Details showing the location of all openings in decks within the cargo holds.
- (h) Details of longitudinal girders supporting hatch coamings where fitted.

1.5 Symbols and definitions

1.5.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L , L_{pp} , B , D , T , V , C_b as defined in Pt 3, Ch 1, 6 Definitions

e = base of natural logarithms, 2,7183

k_L , k = higher tensile steel factor, see Pt 3, Ch 2, 1 Materials of construction

s = spacing of secondary stiffeners, in mm

s_1 = spacing of secondary stiffeners, but is not to be taken less than $470 + 1,67L$ mm

t = thickness of plating, in mm

L_1 = L but need not be taken greater than 190 m.

■ **Section 2**
Materials

2.1 Materials

2.1.1 Materials are to comply with Pt 3, Ch 2 Materials.

2.1.2 Attention is drawn to the specific requirements for container ship hatch corners in Table 2.2.1 Buckling factors of safety, λ , Note 1 in Pt 3, Ch 2 Materials.

2.2 Protection of steelwork

2.2.1 In addition to the requirements of Pt 3, Ch 2, 3 Corrosion protection the requirements of Pt 4, Ch 1, 2.2 Protection of steelwork may also be applied.

2.3 Requirements for use of thick steel plates

2.3.1 This Section provides the requirements for crack arrest design to reduce the risk of brittle fractures in container ships where thick steel plates are applied for longitudinal structural members within the cargo hold region.

2.3.2 This Section is to be applied to container ships where the steel plates for longitudinal structural members exceed a thickness of 50 mm but are not greater than 100 mm. Special consideration is required for plates with a thickness exceeding 100 mm.

2.3.3 This Section applies to plates having specified minimum yield strength of 355, 390 and 460 N/mm². Steels and weldments are to comply with the toughness requirements of Ch 3 Rolled Steel Plates, Strip, Sections and Bars, Ch 11 Approval

Container Ships

Part 4, Chapter 8

Section 2

of Welding Consumables and Ch 12 Welding Qualifications of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

2.3.4 The approach in this Section generally applies to the erection block-to-block joints. Appropriate measures are to be considered to prevent large scale fracture of the hull girder in anticipation of the following:

- (a) Crack initiation in the block-to-block butt weld joint in either the hatch side coaming or upper deck. Crack propagates along the butt weld joint without deviation.
- (b) Crack initiation in the block-to-block butt weld joint in either the hatch side coaming or upper deck. Crack propagates away from the butt weld joint running into base metal.
- (c) Crack initiation in any welded joint, for example in way of attachment welds, and deviates away from the butt weld joint running into base metal.

2.3.5 The detailed arrangements for crack arrest design are to be submitted for approval.

2.3.6 Where Measure 1 is required in Table 8.2.1 Preventative measures to be used in design and construction for thick steel plates, 100 per cent ultrasonic testing in accordance with Ch 13, 2.12 Non-destructive examination of welds of the Rules for Materials, both application and acceptance criteria, is to be carried out on all block-to-block butt joints of all upper flange longitudinal structural members in the cargo hold region. Upper flange longitudinal structural members include the topmost strakes of the inner hull/bulkhead, the sheer strake, main deck, coaming plate, coaming top plate, and all attached longitudinal stiffeners. These members are defined in Figure 8.2.1 Upper flange longitudinal structural members.

Table 8.2.1: Preventative measures to be used in design and construction for thick steel plates

Nominal yield strength (N/mm ²)	Thickness (mm)	Measure		
		1	2 (see Note 1)	3 (see Note 1)
355	50 < t ≤ 85	Not required	Not required	Not required
	85 < t ≤ 100	Required	Not required	Not required
390	50 < t ≤ 85	Required	Not required	Not required
	85 < t ≤ 100	Required	Required (see Note 2)	Required
460	50 < t ≤ 85	Required	Required (see Note 2)	Required
	85 < t ≤ 100	Required	Required (see Note 2)	Required
Key to measures:				
Measure 1:	This measure is mandatory where 'Required' is shown, see Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates.			
Measure 2:	Design based on crack arrest, see Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates and Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates.			
Measure 3:	Design based on crack initiation, see Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates.			
Note 1 Measure 2 or Measure 3 is to be applied where 'Required' is shown.				
Note 2 Brittle crack arrest steel to be applied for upper deck along the cargo hold region to prevent crack propagation from the coaming into lower structure.				

Figure 8.2.1: Upper flange longitudinal structural members

2.3.7 The following are considered to be acceptable examples of brittle crack arrest design for the case given in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates and Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates:

- (a) Where the block-to-block butt welds of the hatch side coaming and those of the upper deck are staggered, this offset is to be greater than or equal to 300 mm. This offset distance is defined in Figure 8.2.2 Minimum offset between block-to-block butt welds of the hatch side coaming and those of the upper deck staggered. Brittle crack arrest steel, as defined in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates, is to be provided for the hatch side coaming.
- (b) Where crack arrest holes are provided in way of the block-to-block butt welds at the region where the hatch side coaming weld meets the deck weld, see Figure 8.2.3 Crack arrest hole in way of the block-to-block butt weld at the region where hatch side coaming weld meets the deck weld, the corners of the crack arrest holes located where the hatch side coaming joints meet the deck weld are to be specially assessed for fatigue strength. The fatigue strength is also to be assessed at the location where the block-to-block butt weld intersects the crack arrest hole. Brittle crack arrest steel, as defined in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates, is to be provided for the hatch side coaming.
- (c) Where higher crack arrest steel insert plates such as SUF (Surface Layer with Ultra-Fine grain) steel or equivalent, or weld metal inserts with high crack arrest toughness properties are provided in way of the block-to-block butt welds at the region where hatch side coaming weld meets the deck weld. Brittle crack arrest steel, as defined in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates, is to be provided for the hatch side coaming.

Figure 8.2.2: Minimum offset between block-to-block butt welds of the hatch side coaming and those of the upper deck staggered

Figure 8.2.3: Crack arrest hole in way of the block-to-block butt weld at the region where hatch side coaming weld meets the deck weld

2.3.8 For the case given in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates, brittle crack arrest steel, as defined in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates, is to be used for the upper deck along the cargo hold region to arrest a brittle crack initiating from the coaming plate and propagating into the structure below.

2.3.9 Brittle crack arrest steel is to be in accordance with the Rules for Materials, Ch 3, 3 Higher strength steels for ship and other structural applications.

2.3.10 Where higher crack arrest steel or weld inserts are proposed, as given in Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates, the specific properties or grades of material are to be agreed with LR.

2.3.11 As an alternative to Pt 4, Ch 8, 2.3 Requirements for use of thick steel plates, consideration may be given to the use of crack arrest steel in all the structural parts of the hatch coaming top, hatch coamings, upper deck and first strake below the upper deck.

2.3.12 As an alternative to crack arrest design, design based on crack initiation may be considered. Design based on this approach aims to prevent any defect from propagating into a brittle fracture by ensuring that no defect exists above a calculated

size in the weld either during construction or subsequently in service. This size is determined by way of an Engineering Critical Assessment (ECA) which must be carried out and submitted to LR prior to construction. The ECA will determine the minimum acceptable defect size from both fatigue crack growth and fracture mechanics calculations. The detectability of such a defect in the structure will also need to be proven to LR. This can only be achieved through assessment of the non-destructive examination techniques and procedures to be applied. It is anticipated that, for this approach to be successful, the application of advanced NDT, such as the Time of Flight Diffraction (TOFD) Technique, will be necessary. The approach will also need to include a programme of non-destructive testing during the lifetime of the ship to ensure that growth of a defect does not exceed the limits of the ECA.

2.3.13 Table 8.2.1 Preventative measures to be used in design and construction for thick steel plates summarises a selection of measures aimed at mitigating the risk of uncontrolled brittle fracture in way of deck and hatch coaming structure. A range of thicknesses is shown for the different strength grades of steel; where the maximum as-built thickness falls within this range, measures are to be selected as shown in the Table. If the as-built thickness of the hatch coaming structure is below the values contained in the Table, then additional measures are not necessary.

■ Section 3 Longitudinal strength

3.1 General

3.1.1 Longitudinal strength calculations are to be carried out in accordance with Pt 4, Ch 8, 3.2 Longitudinal strength and Pt 4, Ch 8, 3.3 Combined longitudinal and torsional strength

3.1.2 Alternatively the values and distributions of wave induced loads may be derived by direct calculation in accordance with LR's ShipRight Procedure *Guidance Notes on the Assessment of Global Design Loads of Large Container Ships and Other Ships Prone to Whipping and Springing*.

3.1.3 For ships of abnormal hull form, or for ships of unusual structural configuration or complexity, the values and distributions of wave induced loads are to be agreed with LR. LR may decide to mandate the application of the ShipRight notations; **SDA, FDA, FDA SPR** or **WDA**.

3.2 Longitudinal strength

3.2.1 Longitudinal strength calculations are to be made in accordance with the requirements of Pt 3, Ch 4 Longitudinal Strength and the additional notes contained in this Section and Pt 4, Ch 8, 14 Direct calculation.

3.2.2 The design vertical wave bending moments and design wave shear forces are to be determined in accordance with Pt 4, Ch 2, 2.4 Design vertical wave bending moments and Pt 4, Ch 2, 2.5 Design wave shear force and are to be used in Pt 3, Ch 4 Longitudinal Strength.

3.2.3 The values of sagging f_S and hogging f_H correction factors due to non-linear effects of the hull shape are to be derived by non-linear ship motion analysis based on equivalent design sea state methods where the following condition applies:

(a) $L > 300$ m and one or more of

- (i) $|f_S| > 1,4$ or
- (ii) $RA_{BF} > 0,2$ or
- (iii) $RA_{BFU} > 0,2$

where

(a) f_S and f_H are defined in Pt 4, Ch 2, 2.4 Design vertical wave bending moments

RA_{BF} = is the bow flare area ratio for the lower region just above the still waterline

$$= \left(\frac{A_{BF}}{0,1LB_{WL}} \right)$$

(b) RA_{BFU} = is the bow flare area ratio for the upper region near the deck

$$= \left(\frac{A_{BFU}}{0,1LB_{WL}} \right)$$

A_{BF}, B_{WL} = are defined in Pt 4, Ch 2, 2.4 Design vertical wave bending moments

A_{BFU} = is the bow flare area in m² for the region from a waterline of $T_{C,U}$ to $T_{C,2U}$, calculated in the same way as A_{BF} see Pt 4, Ch 2, 2.4 Design vertical wave bending moments

$T_{C,2U}$ = $T + C_1$ m or the local deck edge height if this is lower

C_1 = is defined in Table 4.5.1 Superstructures and deckhouses on forecastle deck in Pt 3, Ch 4 Longitudinal Strength

The methodology to calculate the non-linear ship motion wave loads is given in LR's ShipRight Procedure *Guidance Notes on the Assessment of Global Design Loads of Large Container Ships and Other Ships Prone to Whipping and Springing*.

3.3 Combined longitudinal and torsional strength

- (a) The strength of the ship to resist a combination of longitudinal and torsional loads is to be determined in accordance with Pt 4, Ch 8, 15.1 Application.

Section 4 Deck structure

4.1 General

- 4.1.1 The requirements of Pt 4, Ch 1, 4 Deck structure are to be complied with as modified by this Section.
- 4.1.2 The strength deck is to be longitudinally framed throughout the region of container holds for ships where $L \geq 100$ m.
- 4.1.3 Lower decks/side stringers are to be efficiently scarfed into the machinery space, and the fore end and aft end structure.
- 4.1.4 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of deck structures.

4.2 Primary supporting structure

- 4.2.1 Where decks form part of the primary support structures described in Pt 4, Ch 8, 6.2 Side shell primary supporting structure and Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure the scantlings of the decks are to be verified by direct calculation procedures in accordance with Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

4.3 Deck plating and stiffeners

- 4.3.1 Strength/weather deck scantlings outside the line of hatch openings are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 4.2 Primary supporting structure, and are to be not less than required by Pt 4, Ch 1, 4.2 Deck plating and Pt 4, Ch 1, 4.3 Deck stiffening.
- 4.3.2 Within the cargo holds, strength/weather/second deck scantlings inside the line of hatch openings are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength, Pt 4, Ch 8, 4.2 Primary supporting structure and Pt 4, Ch 8, 4.4 Cross decks.
- 4.3.3 Other deck scantlings are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength, Pt 4, Ch 8, 4.2 Primary supporting structure and Pt 4, Ch 1, 4 Deck structure as appropriate.

4.4 Cross decks

- 4.4.1 The width and scantlings of cross-deck strips are to satisfy the requirements of Pt 4, Ch 8, 4.2 Primary supporting structure. The thickness, t , of cross-deck strips is to comply with the requirements of Table 8.4.1 Cross deck plating.

Table 8.4.1: Cross deck plating

Location	Minimum thickness, in mm
At strength deck	The greater of the following: (a) $t = 0,012s_1$ (b) $t = 10 + 0,01L_1$
At second deck	The greater of the following: (a) $t = 0,012s_1$ but need not exceed 12 (b) $t = 8,0$
Symbols	
s_1 and L_1 as defined in Pt 4, Ch 8, 1.5 Symbols and definitions.	

4.4.2 The thickness may require to be increased locally in way of access openings.

4.4.3 Where the difference between the thickness of plating inside and outside the line of main hatchway openings exceeds 25 mm, a single transition plate is to be fitted at the end of the cross deck strip. The thickness of the transition plate is to be equal to the mean of the adjacent plate thicknesses.

4.4.4 The scantlings of cross-deck stiffeners are to comply with Pt 4, Ch 1, 4 Deck structure.

4.4.5 For initial design purposes the width of the cross deck strips, w , forming a transverse bulkhead top box (or equivalent) can be estimated according to the following formula:

$$w = 32,5B + 400, \text{ or } 1000 \text{ mm, whichever is the greater}$$

where B is given in Pt 4, Ch 8, 1.5 Symbols and definitions.

4.5 Deck openings

4.5.1 The corners of main hatchway openings are generally to be rounded. However, corners with negative radii, or parabolic or elliptic profiles will be specially considered.

4.5.2 The design of hold corners including deck thickness and corner profile is to comply with either Pt 4, Ch 8, 4.5 Deck openings or Pt 4, Ch 8, 4.5 Deck openings.

4.5.3 The design of hatch corners is to be verified by direct calculations, see Pt 4, Ch 8, 14.1 Procedures for calculation of combined longitudinal and torsional strength.

4.5.4 Alternatively, where the design of hatch corners has not been verified by direct calculations:

- (a) The outboard radius of main hatchway openings at strength deck level is, in general, to be not less than 35 per cent of the width of the cross-deck strip indicated in Pt 4, Ch 8, 4.4 Cross decks with a minimum of 300 mm.
- (b) The radius of the hatch corners of the main hatchway openings adjacent to the engine room is to be made as large as practicable, with a radius of approximately $40B$ mm.
- (c) Insert plates at main hatch corners are to have an increased thickness above the adjacent plating outside the line of hatchways of 15 per cent in way of the container holds, and 25 per cent in container holds at engine room bulkheads. The minimum increase is to be not less than 4,0 mm, nor need exceed 7,0 mm, and the minimum fore and aft extent is to be 1,0 m from the edge of the openings.

4.6 Local reinforcement

4.6.1 Attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided, particularly in highly stressed areas. Arrangements in way of openings are to be such as to minimise the creation of stress concentrations.

4.6.2 In general, large access openings are not to be arranged in the strength deck outside the line of main hatchways in the region of container holds.

4.6.3 Small openings, such as those for ventilation pipes or scuppers, are to be kept clear of hold corners, ends of longitudinal hatch coamings, ends of cross-deck strips and other critical locations.

4.7 Support for container corner seats

4.7.1 In general, local stiffening is to be fitted under seats for container supports.

4.7.2 The design of attachments to the strength deck is to minimise the effects of stress concentration, and consideration is to be given to the strength and grade of welding consumable used, see, Ch 13, 2.2 Welding consumables of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

4.7.3 The strength of support arrangements is to be verified in accordance with Pt 3, Ch 14, 4 Ship structure.

4.7.4 Doubler plates are not to be utilised in connections subject to tensile loads.

■ **Section 5** **Shell envelope plating**

5.1 General

5.1.1 The requirements of Pt 4, Ch 1, 5 Shell envelope plating are to be applied, together with the requirements of this Section.

5.1.2 The bottom shell is, in general, to be longitudinally framed for ships where $L > = 100$ m.

5.1.3 The side shell may be longitudinal or transversely framed, except in way of the topside torsion box which is, in general, to be longitudinally framed.

5.2 Bottom shell and bilge

5.2.1 The thickness of the bottom shell plating is to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 7.2 Double bottom primary supporting structure and is to be not less than required by Pt 4, Ch 1, 5.3 Bottom shell and bilge.

5.2.2 In regions where transverse framing is adopted, particularly towards the end of the ship, the buckling stability of the plating will be specially considered.

5.3 Side shell and sheerstrake

5.3.1 The thickness of the side shell and sheerstrake plating is to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 6.2 Side shell primary supporting structure and is to be not less than required by Pt 4, Ch 1, 5.4 Side shell.

5.3.2 At positions where high shear forces are present, local increases in thickness may be required.

5.3.3 The difference in thickness between the sheerstrake and shell plating below is not to exceed 25 mm.

■ **Section 6** **Shell envelope framing**

6.1 General

6.1.1 The requirements of Pt 4, Ch 1, 6 Shell envelope framing are to be applied, together with the requirements of this Section.

6.1.2 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)* indicates recommended examples of configurations for end connections of shell envelope longitudinals.

6.2 Side shell primary supporting structure

6.2.1 A primary supporting structure for side shell envelope framing is to be provided of either single or double skin construction. This normally consists of a combination of vertical transverse webs and horizontal side stringers/decks.

6.2.2 Transverse webs supporting side shell envelope framing are to be arranged in line with the floors in the double bottom to ensure continuity of transverse strength.

6.2.3 The scantlings of double skin primary structure, including thickness of side shell envelope plating, are to be verified by direct calculations in accordance with Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

6.2.4 The scantlings of single skin primary structure are to comply with Pt 4, Ch 1, 6.4 Primary supporting structure. Alternatively the scantlings are to be verified by direct calculations in accordance with Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

6.3 Side stringers in double skin construction

6.3.1 The scantlings of side stringers are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength, Pt 4, Ch 8, 6.2 Side shell primary supporting structure and Pt 4, Ch 8, 6.5 Minimum thickness of transverse webs/side stringers in double skin construction.

6.3.2 In addition, the scantlings of watertight side stringers are to satisfy the requirements of Pt 4, Ch 1, 9 Bulkheads.

6.4 Transverse webs in double skin construction

6.4.1 The scantlings of transverse webs are to satisfy the requirements of Pt 4, Ch 8, 6.2 Side shell primary supporting structure and Pt 4, Ch 8, 6.5 Minimum thickness of transverse webs/side stringers in double skin construction.

6.4.2 Transverse webs are to be efficiently stiffened, and the thickness increased locally where necessary on account of high shear stress.

6.4.3 Where, towards the end of the ship, the width of transverse webs reduces from that assumed in the direct calculations, the thickness may require to be increased locally.

6.5 Minimum thickness of transverse webs/side stringers in double skin construction

6.5.1 Transverse webs and side stringers are to have a thickness, t , not less than:

$$t = 7,5 + 0,015L \text{ or } 9 \text{ mm, whichever is the lesser.}$$

■ *Section 7*
Double bottom structure

7.1 General

7.1.1 The double bottom is, in general, to be longitudinally framed for ships where $L \geq 100$ m.

7.1.2 Longitudinally framed double bottoms are to comply with Pt 4, Ch 1, 8.2 General and the contents of this Section.

7.1.3 Transversely framed double bottoms are to comply with Pt 4, Ch 1, 8 Double bottom structure.

7.1.4 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of the double bottom.

7.2 Double bottom primary supporting structure

7.2.1 The primary supporting structure formed by the double bottom comprises inner bottom plating, floors, longitudinal girders and bottom shell plating.

7.2.2 The scantlings of this primary structure are to be verified by direct calculations in accordance with Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

7.2.3 Where, towards the end of the ship, the depth of double bottom structure webs is reduced from that assumed in the direct calculations, the thickness may require to be increased locally.

7.2.4 Where mid-hold or quarter-length-of-hold supports for the double bottom structure are arranged, these are to take the form of an efficiently stiffened transverse box or open section structure, see Pt 4, Ch 8, 9.4 Transverse non-watertight mid-hold bulkheads.

7.3 Inner bottom plating and stiffening

7.3.1 The scantlings of the inner bottom are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 7.2 Double bottom primary supporting structure and are to be not less than required by Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening as modified by this sub-Section.

7.3.2 The requirements of Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening need not be applied to container ships.

7.3.3 In applying Pt 4, Ch 1, 8.4 Inner bottom plating and stiffening, the Rule value of bottom longitudinals may be calculated assuming $F_{sb} = 1,05$.

7.4 Girders

7.4.1 Girders are, in general, to be arranged under container corner seatings.

7.4.2 The scantlings of watertight centreline/side girders are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 7.2 Double bottom primary supporting structure and are to be not less than required by Pt 4, Ch 1, 8.3 Girders.

7.4.3 The scantlings of non-watertight centreline/side girders are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 7.2 Double bottom primary supporting structure.

7.4.4 For double bottoms having a depth greater than 1,6 m, additional longitudinal stiffening may have to be introduced in order to ensure the buckling stability of the girders.

7.5 Floors

7.5.1 Plate floors are to be fitted under watertight bulkheads, non-watertight bulkheads/mid-hold supports, under container corners at hold quarter length locations and at other locations to ensure that the maximum spacing does not, in general, exceed 3,8 m. Proposals for floor spacings greater than 3,8 m are to be supported by direct calculations agreed with LR.

7.5.2 The scantlings of watertight floors are to satisfy the requirements of Pt 4, Ch 8, 7.2 Double bottom primary supporting structure and are to be not less than required by Pt 4, Ch 1, 8.5 Floors.

7.5.3 The thickness, t , of non-watertight floors is to satisfy the requirements of 7.2 and is to be not less than:

$$t = 6 + 0,03L \text{ or } 12 \text{ mm, whichever is the lesser.}$$

7.5.4 Non-watertight floor stiffeners are to be fitted at approximately the same spacing as the bottom longitudinals. The scantlings are to satisfy the requirements of Pt 3, Ch 10 Welding and Structural Details.

7.5.5 Docking brackets, or equivalent, are to be fitted in accordance with Pt 4, Ch 1, 8.5 Floors.

7.6 Support for containers

7.6.1 In general, local stiffening is to be fitted to double bottom floors or girders under container corner seatings in order to ensure the effective transmission of load.

7.6.2 Such stiffening normally takes the form of additional brackets with suitable extensions to adjacent stiffening members. The scantlings of the adjacent stiffening members may require to be increased depending on the arrangements proposed.

7.6.3 Attention is drawn to the benefit of direct support in order to minimise the effect of eccentric loading on the support brackets.

7.6.4 The scantlings of these arrangements may be determined utilising simple beam models to verify the shear and bending strength. Based on static container loads, the stresses induced in the structure are not to exceed the permissible values stated in Table 8.7.1 Permissible stress values. Alternative more complex assessment methods are to be agreed with LR.

7.6.5 In general, doubling members or equivalent structures are to be attached to the inner bottom to distribute the load from container corners into the supporting structure. Doubler plates are to have well-rounded corners.

Table 8.7.1: Permissible stress values

	Permissible stress, N/mm ² (kgf/mm ²)
Normal stress (bending, tension, compression)	$0,67\sigma_0$
Shear stress	$0,4\sigma_0$
Combined stress	$0,86\sigma_0$
Symbols	
σ_0 = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

■ Section 8

Longitudinal bulkheads

8.1 General

- 8.1.1 The requirements of Pt 4, Ch 1, 9 Bulkheads are to be applied, together with the requirements of this Section.
- 8.1.2 Longitudinal bulkheads may be transversely or longitudinally framed, except in way of the topside torsion box which is, in general, to be longitudinally framed.
- 8.1.3 Longitudinal bulkheads are to be maintained continuous in way of the machinery space where this is situated between container holds and as far forward and aft as practicable.
- 8.1.4 The scarfing arrangements in way of the steps are to be sufficient to ensure an efficient overlap of the inner skin bulkheads.
- 8.1.5 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of the double side skin structures.

8.2 Side shell primary supporting structure

- 8.2.1 Where the longitudinal bulkhead forms the inner skin of the side shell primary supporting structure the thickness of longitudinal bulkhead plating is to be verified by direct calculations as described in Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.

8.3 Plating and stiffeners

- 8.3.1 The scantlings of longitudinal bulkheads are to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength and Pt 4, Ch 8, 8.2 Side shell primary supporting structure and are to be not less than required by Pt 4, Ch 1, 9 Bulkheads.
- 8.3.2 Openings in the upper parts of longitudinal bulkheads are to have shapes which minimise stress concentrations and are to be framed to ensure adequate buckling stability.
- 8.3.3 The difference in thickness between the top strake and the bulkhead plating below is not to exceed 25 mm.

8.4 Support for container corner seats

- 8.4.1 Where direct support for 20 ft containers by the longitudinal bulkhead is required at the mid length of a cell arranged for 40 ft containers, adequate stiffening is to be fitted in order to ensure the effective transmission of load.
- 8.4.2 The strength of these arrangements is to be verified in accordance with Pt 3, Ch 14, 4 Ship structure.

■ Section 9

Transverse bulkheads**9.1 General**

- 9.1.1 The requirements of Pt 4, Ch 1, 9 Bulkheads are to be applied, together with the requirements of this Section.
- 9.1.2 Watertight transverse bulkheads may be vertically or horizontally framed.
- 9.1.3 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of transverse bulkhead structures.

9.2 Transverse watertight/non-watertight bulkhead primary supporting structure

- 9.2.1 The primary supporting structure of transverse bulkheads normally comprises a grillage of vertical webs and horizontal stringers/decks.
- 9.2.2 Vertical webs are to be fitted in line with double bottom girders.
- 9.2.3 The scantlings of transverse bulkhead primary structure including bulkhead plating are to be verified by direct calculations as described in Pt 4, Ch 8, 14.2 Procedures for verification of primary structure scantlings.
- 9.2.4 The scantlings are to be adequate for the static and dynamic loads imposed on the structure by the container stowage arrangements.

9.3 Transverse watertight bulkheads

- 9.3.1 The thickness of the transverse bulkhead plating is to satisfy the requirements of Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure and is to be not less than required by Pt 4, Ch 1, 9.2 Watertight and deep tank bulkheads for watertight bulkheads.
- 9.3.2 In general, a transverse box structure or equivalent is to be arranged at upper deck level.
- 9.3.3 In certain cases, a transverse box structure at the inner bottom may also be required.

9.4 Transverse non-watertight mid-hold bulkheads

- 9.4.1 Where non-watertight bulkheads are arranged in conjunction with the double bottom mid-hold support, a transverse box is to be arranged at strength deck level.
 - 9.4.2 Non-watertight bulkhead scantlings are to satisfy the requirements of Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure and Pt 4, Ch 1, 4.4 Deck supporting structure for a non-watertight pillar bulkhead.
-

■ Section 10

Hatch coamings and support for hatch covers**10.1 Hatch coamings**

- 10.1.1 Scantlings of hatch coamings are to comply with Pt 3, Ch 11, 5 Hatch coamings in addition to the requirements of this Section.
 - 10.1.2 Continuous side coamings are to be effectively scarfed into the deckhouse structure or gradually tapered at ends, as applicable. The scantlings are also to satisfy the requirements of Pt 4, Ch 8, 3 Longitudinal strength.
 - 10.1.3 The scantlings of transverse hatch coamings forming part of a transverse bulkhead top box are also to satisfy the requirements of Pt 4, Ch 8, 9.2 Transverse watertight/non-watertight bulkhead primary supporting structure.
 - 10.1.4 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates examples of recommended structural design configurations in critical areas of the hatch side coamings.
-

10.2 Support for inboard edges of hatch covers by girders

10.2.1 Where longitudinal underdeck girders are fitted at deck level to support the hatch covers the requirements of this sub-Section are to be complied with.

10.2.2 The girders may take the form of open or closed box sections and these should align with webs on the transverse bulkheads to form a continuous ring structure.

10.2.3 The girders are, in general, to be continuous throughout the container hold area, including the engine room where this is situated between container holds.

10.2.4 Special attention is to be given to the intersection of the girders with transverse box girders and the integration into the fore end, aft end and machinery space structures.

10.2.5 Where girders are integrated into the cross-deck strips, inserts plates with integral gussets are to be incorporated. The inserts are to have a thickness not less than that of the girder top and bottom plates, as appropriate. The radius of main hatchway openings in way of ends of hatch girders at upper deck level is, in general, to be not less than 20 per cent of the width of the cross-deck strip indicated in Pt 4, Ch 8, 4.4 Cross decks with a minimum of 250 mm.

10.2.6 Scantlings of girders are to comply with the requirements of Pt 4, Ch 1, 4 Deck structure.

10.3 Support for hatch cover fittings

10.3.1 The width of hatch coaming top plates is to be suitable to accommodate the hatch covers and associated fittings.

10.3.2 Local stiffening is to be fitted below hatch cover supporting devices and in some cases the thickness of the coaming in way may need to be increased, (see also Pt 3, Ch 11, 4.2 Steel covers – Clamped and gasketed and Pt 3, Ch 11, 5.2 Construction).

■ Section 11

Hatch covers

11.1 General

11.1.1 The requirements of Pt 3, Ch 11 Closing Arrangements for Shell, Deck and Bulkheads are to be complied with in addition to the requirements of this Section.

11.1.2 The primary structure of hatch covers normally consists of an arrangement of deep beams and girders including hatch cover top plating.

11.1.3 For hatch covers subjected to point loads from containers, the primary structure scantlings are to be verified by direct calculation in accordance with Pt 4, Ch 8, 11.2 Direct calculations.

11.1.4 Local stiffening is to be arranged below container corners. The substructures of container foundations are to be designed for cargo and container loads according to Pt 3, Ch 11, 2.3 Load model, applying the permissible stresses according to Pt 3, Ch 11, 2.4 Allowable stress and deflection.

11.2 Direct calculations

11.2.1 Direct calculations are to be based on 2D or 3D finite element analysis. Simplified boundary constraints may be applied in the modelling, provided this does not compromise the overall structural response.

11.2.2 Where containers are stowed on hatch covers, the following loads due to heave, pitch, and the ship's rolling motion are to be considered, see Figure 8.11.1 Forces due to container loads:

$$A_z = 9,81 \frac{M}{2} (1 + a_v) \left(0,45 - 0,42 \frac{h_m}{b} \right) \text{ kN}$$

$$B_z = 9,81 \frac{M}{2} (1 + a_v) \left(0,45 + 0,42 \frac{h_m}{b} \right) \text{ kN}$$

$$B_y = 2,4M \text{ kN}$$

= The loads due to single forces resulting from heave and pitch are also to be considered, as defined in Pt 3, Ch 11, 2.3 Load model, where

a_v = acceleration addition according to Pt 3, Ch 11, 2.3 Load model

b = distance between foot points, in metres

h_m = designed height of centre of gravity of stack above hatch cover supports, in metres

A_z, B_z = support forces in z-direction at the forward and aft stack corners, in kN

B_y = support force in y-direction at the forward and aft stack corners, in kN

M = maximum designed mass of container stack, in t.

= For M and h_m , it is recommended to apply those values which are used for the calculations of cargo securing (container lashing). If different assumptions are made for M and h_m , the designer is to ensure that, in the calculation model, the hatch cover structure is not loaded by less than those values recommended.

= When the strength of the hatch cover structure is assessed by FE analysis according to the ShipRight procedure *Assessment of Steel Hatch Covers using Finite Element Analysis*, h_m may be taken as the designed height of centre of gravity of stack above the hatch cover top plate. Values of M and h_m applied for the assessment of hatch cover strength are to be shown in the drawings of the hatch covers.

Figure 8.11.1: Forces due to container loads

11.2.3 The forces acting on hatch covers when container stacks are secured to lashing bridges or carried in cell guides will be specially considered.

11.2.4 A load case with partial non-homogeneous loading is also to be considered, e.g. where specified container stack places are empty. This may be evaluated using a simplified approach, where the hatch cover is loaded without the outermost stacks, see Figure 8.11.2 Partial loading of a container hatch cover.

Figure 8.11.2: Partial loading of a container hatch cover

11.2.5 The securing devices of hatch covers, onto which cargo is to be lashed, are to be designed for the lifting forces resulting from loads according to Pt 4, Ch 8, 11.2 Direct calculations, see Figure 8.11.3 Lifting forces at a hatch cover. Unsymmetrical loadings, which may occur in practice, are to be considered. Under these loadings, the equivalent stress in the securing devices is not to exceed:

$$\sigma_v = \frac{150}{k_1} \text{ in N/mm}^2$$

Special consideration may be given for the omission of antilifting devices for non-weathertight hatch covers.

Figure 8.11.3: Lifting forces at a hatch cover

11.2.6 Where hatch covers are arranged for carrying containers and mixed stowage is allowed, i.e. a 40' container stowed on top of two 20' containers, particular attention is to be paid to the deflections of hatch covers. Furthermore, the possible contact of deflected hatch covers with in-hold cargo is to be considered.

11.3 Dispensation of weathertight gaskets

11.3.1 For hatch covers of cargo holds solely for the transport of containers, upon request by the Owners and subject to compliance with the requirements of this Section, the fitting of weathertight gaskets according to Pt 3, Ch 11, 4.4 Packing material may be dispensed with.

11.3.2 The hatchway coamings are not to be less than 600 mm in height.

11.3.3 The exposed deck on which the hatch covers are located is situated above a depth $H(x)$. $H(x)$ is to be shown to comply with the following criteria:

$$H(x) = \geq T_{fb} + f_b + h, \text{ in metres}$$

where

T_{fb} = draught, in metres, corresponding to the assigned summer load line
